Crozier Theological Seminary, in the borough of Upland, near Chester, Pa. It was founded by John P. Crozier, his wife, Sallie Knowles Crozier, and his children, who jointly endowed the school with lands, buildings, and invested funds amounting to $275,000. The school was incorporated in 1867 and in 1902 had in attendance 108 students.

Crucible, a vessel used in chemistry and the arts for containing substances that are to be subjected to high temperatures. A good crucible should be capable of withstanding great and sudden changes of temperature without fracture or disintegration; it should not be attacked by the substance it is to contain; and it should be infusible at the temperatures to which it is to be exposed. Numerous materials are used in the manufacture of crucibles, each having its own peculiar advantages and disadvantages. Platinum is an ideal material for many purposes, but it is exceedingly expensive, and it cannot be used for the fusion of metals. Clay, or a mixture of clay with sand, graphite, or old broken crucibles, is a favorite material, and Hessian crucibles, composed of equal parts of clay and sand, are in very general use. Hessian crucibles are commonly triangular in shape and coarse in texture. They are porous, they fracture easily from sudden changes in temperature, and they will not withstand the action of litharge; but they are cheap, and will not fuse at any temperature that is attained in ordinary operations. The clay that is used in the manufacture of crucibles should be «weathered» for some months, by exposure to air in a moist condition, in order to effect the decomposition or elimination of certain impurities, such as pyrites, that would be prejudicial to the finished vessel. Graphite is used to a considerable extent in the manufacture of crucibles, especially for those that are to be used for melting metals. Lime crucibles, cut from blocks of well-burned lime, are practically infusible, but they will not stand exposure to air for any length of time, since they absorb moisture, becoming converted into calcium hydrate, and then disintegrating. Magnesia crucibles are also practically infusible, and are not affected by exposure to the air. A mixture of equal parts of magnesia and bauxite (q.v.) makes excellent crucibles. Alumina (oxide of aluminum) is also highly recommended as a material for crucibles, as it will withstand sudden changes of temperature quite well, is practically infusible for all ordinary purposes, and is not attacked even by melted sodium.

Cruciferæ, kroo-sĭf'ē-rē (Lat. *crux,* cross + *ferre,* to bear), a large order of dicotyledonous plants, the mustard family, consisting of herbs and a few low shrubs with pungent and stimulating but not poisonous properties. The flowers of crucifers have four deciduous sepals and four regular, hypogyrous petals arranged in such a way as to suggest the form of a cross, whence the name of the plants. Of the six stamens two are shorter than the others, and have a lower insertion. The fruit is a two-celled pod, known in its long form as a silique, in its short form as a silicle or pouch, and when articulated and separating at the joints, as a loment. The seeds are without albumen; leaves alternate and exstipulate. The characters of the genera depend upon the pods and seeds. There are about 185 genera and nearly 2,000 species of crucifers dispersed throughout the temperate regions of the globe. They are most abundant in Europe and Asia Minor. Many useful vegetables belong to this family, such as the cabbage, cauliflower, kale, Brussels sprouts, broccoli, and kohlrabi, the various kinds of turnip, and the radish. The horseradish (*Nasturtium armoracia*) has long been known as a condiment. The watercress introduced from Europe now grows wild in America. The seeds of the white mustard (*Brassica alba*) and the black mustard (*B. nigra*) are ground for use as a condiment and also for medicinal purposes. Various well-known ornamental flowers belong to the *Cruciferæ,* such as the wall-flower, the stock, the rocket candytuft, sweet alyssum, honesty, etc. The curious plant known as the rose-of-Jericho or resurrection-plant (q.v.) is also a member of this family.

Crucifix, a cross bearing the figure of Christ. It cannot be said at what time this emblem of the Christian faith began to be used, either by the Christian Church or by individual Christians. A general feeling of repugnance toward the instrument of punishment which, among the Romans, was reserved only for the most infamous class of criminals, would for a long time prevent the early Christians from representing Christ upon the cross, and this feeling would have to be conquered before the crucifix could come into use in public worship. There are certain remains which would seem to show that crucifixes existed in the beginning of the 3d century; but it is probable that all these were merely tokens of individual piety. It is certain that the most ancient crucifixes known to exist belong to this class. Such, for example, is that painted in the Syriac evangelistary of the year 582, contained in the Laurentian library at Florence; and such also is the pectoral cross of the superiors of Monza, which is said to have been a gift of Pope Gregory the Great to Theodolinda, who founded the cathedral. Crucifixes appear to have been first used in public worship toward the end of the 6th century. The most ancient example known of a crucifix used for this purpose is one which, on the testimony of St. Gregory of Tours, was painted in a church at Narbonne. For more than 100 years after this period they were still rare, and it was not till after the Trullan Council, held at Constantinople in 692, which ordained that historic painting should be preferred to emblems or symbolical figures, that the images of Christ crucified began to multiply. As to the manner of representing Christ on the cross it appears to be unquestionable that, as a rule, the figures on the most ancient crucifixes were engraved on gold, silver, or iron crosses. On the pectoral cross of Monza, however, the figures are enameled on a gold cross. At a later

period they were painted on wood, and it is only in the 9th century, in the pontificate of Leo III., that the figure of Christ appears carved upon the cross in bas-relief. Although there can be no doubt that Christ, in accordance with the Roman custom of representation, was crucified naked, all the most ancient crucifixes, almost without exception, represent him as clothed with a tunic reaching down to the feet. This practice lasted down to the 8th century, when it began to be modified, the body of Christ being no longer covered above the loins; and at length it became the custom to represent Christ, as in the crucifixes of the present day, entirely naked with the exception of a cloth about the loins. Another point in which the ancient crucifixes differ from modern ones is as to whether Christ is represented dead or alive. Until the 11th century he is represented alive; since that period he has been represented as dead. The first example of Christ being represented as dead is furnished by a manuscript in the Laurentian library at Florence, belonging to about the year 1059. In the earlier crucifixes, also, the number of nails by which Christ is fixed to the cross is four, one through each hand and each foot, while in the more modern ones there are only three nails, one foot being laid above the other and a single nail driven through both. Many crucifixes bear also the inscription put upon the cross by the order of Pilate, but this is always found in an abbreviated form, both in ancient and modern times. In the Latin Church it is frequently omitted, but the Greek Church have adhered more strictly to this practice. Various accessories are also sometimes found in crucifixes, such as figures of the sun and moon, the lamb, of the Virgin Mary, and Saint John, of the two soldiers — one presenting the vinegar for Christ to drink, the other with the lance with which he pierced the side of Christ; emblematical figures representing the four evangelists; angels in a posture of adoration, and certain saints.

Crucifixion, the manner by which Jesus Christ was put to death by the Jews (see St. Matt. xxvii.). Nailing victims to a cross was a mode of punishment frequent among the ancients, but it is now confined to the Mohammedans. Different kinds of crosses were used, as the Latin, with two beams at right angles, the St. Andrew's, made in the form of the letter X, and others. The cross was sometimes employed by the ancients as a terrible instrument of destruction to a vanquished enemy. Thus Alexander the Great, after putting 8,000 or 10,000 Tyrians to the sword, on taking their city, crucified 2,000 more along the shores. Not less sanguinary was the vengeance of the Romans against the Jews; Minutius Alexander crucified 800, and Quinctilius Varus 2,000, on account of some revolt. Titus, whom we are wont to esteem as humane and merciful, crucified above 500 in a day; and at the sack of Jerusalem, under his command, the Romans, wherever they could seize the affrighted fugitives, either in hatred or derision nailed them to crosses about the walls of the city, until the multitude was so great that room was wanting for the crosses, and crosses for the bodies.

Cruden, kroo'dĕn, **Alexander,** Scottish biblical scholar: b. Aberdeen 31 May 1700; d. London 1 Nov. 1770. In 1722 he went to London, where he was employed as tutor in several families. Previous to 1732 he opened a bookseller's shop under the Royal Exchange, and in 1735 was appointed bookseller to Queen Caroline. His great work appeared in 1737, under the title of 'A Complete Concordance of the Holy Scriptures of the Old and New Testament.' In a pecuniary point of view it was not at first successful, and the embarrassments to which it reduced the author caused a return of a mental malady, which occasioned his being sent by his friends to a lunatic asylum. After his release he instituted an action of damages against those who had confined him, and published an account of his confinement under a whimsical title. In 1753 he was again placed in confinement, and again, on being liberated, published an account of his case. Of Cruden's great work, the Concordance, three editions appeared during his life. The pains which he took with it were prodigious, constructing it anew from the foundation, without availing himself of the labors of his predecessors, and verifying personally the accuracy of each quotation and reference. He was also the author of 'A Scripture Dictionary, or Guide to the Holy Scriptures'; and 'The History and Excellency of the Scriptures.'

Cruger, kroo'gĕr, **Julia Grinnell Storrow** («Julien Gordon»), American novelist: b. Paris, France. She has written: 'A Wedding and Other Stories'; 'A Diplomat's Diary'; 'Mademoiselle Réséda'; 'A Puritan Pagan'; 'Marionettes'; 'A Successful Man'; 'Vampires'; 'Poppæa'; etc.

Cruger, Mary, American writer: b. Oscawana, N. Y., 9 May 1834. She was a contributor to the 'Standard Dictionary,' and has written: 'Hyperæsthesia, a Novel' (1885); 'A Den of Thieves: or, the Lay Reader of St. Mark's' (1886); 'The Vanderheyde Manor-House' (1887); 'How She Did It: or, Comfort on $150 a Year' (1888); 'Brotherhood' (1891).

Cruikshank, krŭk shănk, **George,** English illustrator and caricaturist: b. London 27 Sept. 1792; d. 1 Feb. 1878. Family necessities compelled him, when still a child, to produce what he could, and the want of careful preliminary study at his outset in art affected his productions through a great part of his career. Hence his defects were chiefly those of taste, and these have operated to his being popularly ranked somewhat lower as an artist than his merits deserve. For his drawing was always faithful, precise, and felicitous, his facility amazing, and his invention inexhaustible. The catalogue of his productions prepared by the keeper of the prints in the British Museum comprises 5,500 articles, many of them recalling Rembrandt's work by their richness in light and shade. The earliest of his drawings known is dated 1799, when he was only seven years of age, and when 15 he was comparatively distinguished. His first occupation was designing illustrations for children's books and popular songs. In 1837 Cruikshank commenced in 'Bentley's Miscellany' his famous series of etchings on steel illustrative of Dickens' 'Oliver Twist,' full of pathos, humor, and tragic power. Having connected himself with the temperance movement he produced the 'Bottle,' a powerful series of designs, characterized, from its subject and the artist's object, by inevitable vulgarity, but pregnant with genius and high moral teaching.

In spite of his genius, industry, and homely mode of life he never succeeded in acquiring a competency, and was compelled in extreme old age to depend on the aid of his admirers. His true life-work consisted in illustrating the costume, manners, and vices of the people for a period of considerably more than half a century.

Cruiser, an armed vessel which cruises, either to protect the commerce of its own country or to inflict damage on that of another. These vessels are generally built for fast sailing, and are well manned. The cruiser rates technically just below the battleship and just above the gunboat. An armored cruiser has side or vertical armor and horizontal or deck armor. A protected cruiser has horizontal or deck armor only. An unprotected cruiser has no armor. In the United States Navy the name of cruiser is also given to small gunboats. Sometimes in war merchant steamships of great speed are armed to assist a navy, and such vessels are then called auxiliary cruisers. In the Spanish-American war cruisers of this class performed services of great importance to the United States Navy. See NAVY OF THE UNITED STATES, THE; WARSHIP.

Cruive, krūv, in Scotland, a kind of trap used in rivers for catching salmon, made of stakes or hecks, with a large opening by which the salmon may enter but by which they cannot escape, and with smaller openings between the stakes large enough to allow young salmon to escape freely.

Crummell, Alexander, American colored Episcopal clergyman: b. New York 3 March 1819; d. Point Pleasant, N. J., 9 Sept. 1898. His father was a native African and his mother a free woman. He received his education at the Oneida Institute, and in 1839 applied for admission to the General Theological Seminary. His request was refused owing to the intense prejudice against the higher education of the negroes. He accordingly went to England in 1849 and graduated at Cambridge University in 1853. He engaged in missionary work in Liberia 1853–73, when he went to Washington, D. C., and founded St. Luke's Church, of which he was rector until 1895. In 1897 he organized the American Negro Academy in New York. He published: 'The English Language in Liberia' (1861); 'The Future of Africa' (2d ed. 1862); 'The Negro Race Not Under a Curse' (1863); 'The Greatness of Christ, and Other Sermons' (1882); 'Africa and America' (1891).

Crusade, Children's. See CRUSADES.

Crusades (Portug. cruzado, "marked with the cross"), the military expeditions which were sent out by the Christian peoples of the West from the end of the 11th till the latter half of the 13th century for the conquest of Palestine. From the earliest times pilgrims had gone to what, because of Christ's life therein, was called the Holy Land. In 637, Palestine fell into the hands of the Mohammedans, but, though several churches were turned into mosques, Christians were allowed full liberty to come and go to the holy places in Jerusalem for nearly four centuries. In 969, the Fatimite dynasty extended its rule over Egypt and Palestine, and with this change of rulers there came an end of the cordial relations. The insults, and even injuries, that Christian pilgrims suffered aroused bitter feeling in the West. Finally Pope Silvester II. (999–1003), one of the best known of the mediæval popes, and famous for his very practical character, issued a call for volunteers for the purpose of freeing the Holy Land. His summons met with no success. In 1073, Palestine came under the control of the Seljukian Turks and the conditions there became even worse than before for the Christians. Pope Gregory VII. (Hildebrand), in 1074, asked the Western nations for help for their suffering brethren in the East, and even suggested to the German emperor, Henry IV., that it would be easy to raise an army of 50,000 for the rescue of the Holy Land from the hands of unbelievers. The idea of the crusades that had thus been incubating in Western minds for nearly a century did not come to fruition until 1095, when the awful state of affairs that Christian pilgrims had to encounter in the Holy Land became unbearable. Peter of Amiens, surnamed the Hermit, saw the terrible situation while on a pilgrimage to the Holy Sepulchre, and succeeded in arousing the interest of Pope Urban II., and obtained permission to preach a crusade.

The first great cause of the crusades, then, was the earnest desire to free the Holy Land. It seemed to the mediæval Christians to be a question of the maintenance of their religious honor that the infidel should not be allowed to occupy the holy places. Other causes conspired for their occurrence just at this period. It was felt by Western rulers, and especially by the popes, that unless the Turks were repressed in the East, they would gradually acquire irresistible power and eventually invade the West, with hope of success. For the lower classes in the West, on the other hand, life had become almost intolerable because of the oppression of the nobles, the frequent wars, and the almost servile duties that feudalism enjoined. As an addition to other causes of dissatisfaction, the harvest had practically failed in the West for several years, and the year 1095 proved to be a particularly bad year for farmers, and many of those dependent on the land and its products suffered severely from famine. These material difficulties predisposed the people to risk all in the hope of betterment. There was little chance to rise in the West, and the vague opportunities of distant war seemed to promise much. Besides, the spirit of chivalry had come in and many of the nobles devoted themselves to the cause with the idea that they would thus win favor of the heavenly queen, the mother of the Lord whose life had been lived in Palestine and whom they had chosen for their patroness. Devotion to the Blessed Virgin also caused women to urge their husbands, brothers, and other male relatives to join in the holy war for the Christian possession of her home. It needed only the intimation of authority to precipitate an Eastern expedition, and that came very naturally from the popes as the acknowledged spiritual heads of Christendom. Pope Urban II., having heard Peter of Amiens' story of Christian suffering in the Holy Land, summoned a council to meet at Piacenza, and gave Peter the opportunity to address the multitude, which assembled in such numbers that he had to talk in the open air. In the following November 1095, ambassadors from all the nations were present at a

council at Clermont, where Peter's words had so much power that with one voice the multitude called out "God wishes it," and this became the slogan of the crusade.

First Crusade.—In 1096, a number of armed bodies set out in different divisions. Many of these hosts were unamenable to military discipline, and, being unprovided with even the necessaries for such an expedition, were practically completely destroyed in the different countries through which they had to pass before reaching Constantinople, which had been chosen for their place of meeting. Only a few stragglers found their way home again or succeeded in maintaining themselves for a time until the arrival of the more regularly organized bodies of troops which set out the next year. With this body were most of the distinguished men whose names are associated with this first great chivalric effort to redeem the Holy Land from the infidel. At the head of nearly 100,000 men were Godfrey of Bouillon, duke of Lower Lorraine; Hugh of Vermandois, brother to Philip, king of France; Baldwin, brother of Godfrey; Robert II. of Flanders; Robert II. of Normandy, brother of William II., king of England; Raymond of Toulouse; Bohemond of Tarentum, son of Robert Guiscard; Tancred of Apulia, cousin of Bohemond; and other heroes. Tancred is the hero of whom so many poets have sung. He was what Chaucer called "the type of the very gentle perfect knight." It is this first crusade that has formed the subject of Tasso's 'Jerusalem Delivered,' and the poem owed not little of its interest to the fact that it was written while the victory at Lepanto was fresh in the mind of the poet and still well remembered by his readers, for, while the crusades are considered to end with the last quarter of the 13th century, the gathering of the naval force that overcame the Turks under Don John of Austria was really the result of the crusading spirit.

The various armies of the First Crusade gathered at Constantinople about Christmas 1096. Here they were delayed for some time by the diplomacy of the Greek emperor, who wished to be assured that the immense forces, which had come partly as the result of his own request for aid, would not prove the ruin of his tottering empire. About Pentecost, 1097, the Crusaders crossed over to Asia by the Strait of Gallipoli, and their first conquest was the town of Nicea in June 1097. Shortly after this, on 4 July, the Crusaders met an Eastern army in pitched battle for the first time, at Dorylaeum, and routed and put it to flight. The crusading army now marched through Asia Minor until they reached Antioch. They would probably have been long delayed in the siege of this town but for treachery which threw it into their hands in June 1098. The citadel, however, remained in possession of the Turkish garrison. Before they captured it, they themselves had to stand siege in Antioch from a Turkish army which surrounded the town soon after its capture. After three weeks of siege the Crusaders were reduced to a very pitiable condition, but on 28 June they made a vigorous sortie and succeeded, in spite of their famished and exhausted condition, in completely routing the Turkish besiegers. The Crusaders remained nearly a year in the neighborhood of Antioch, and only in May 1099 was the march against Jerusalem begun. The siege of the city was commenced early in June. Finally, after six weeks of a fierce siege, the city was captured by a two days' storming, on 15 July. Godfrey of Bouillon was chosen king of Jerusalem, but humbly refused to wear the king's crown on the spot where the Saviour of the world had worn a crown of thorns. He accepted as his designation instead of king that of Defender of the Holy Sepulchre. After scarcely a year of sovereignty, however, he died in 1100 and was succeeded by his brother Baldwin. Baldwin had separated from the main army of the Crusaders while it was in camp in the neighborhood of Antioch, and had proceeded to Edessa. This city was in possession of a Christian prince, who was able to maintain himself only with difficulty against the Mohammedans. Baldwin concluded a treaty by which he agreed to aid this prince against the Mohammedans on condition that he himself should be his successor on his death. This treaty was made in February 1098, and, as the Prince of Edessa was killed soon after in a popular insurrection, Baldwin asserted effectually his claims to succeed him, and soon made himself ruler of an extensive territory stretching even beyond the Armenian Mountains and the plain of Mesopotamia. He was accordingly his brother's natural successor as the ruler in Palestine.

Second Crusade.—In 1144 the Saracens recaptured Edessa. This produced great consternation throughout Europe, because it was feared that the other acquisitions made by the Christians during the First Crusade would also fall once more into the hands of the infidels. As a result, Pope Eugenius III. called upon St. Bernard of Clairvaux to preach the Second Crusade. The two leaders of the expedition were the German emperor, Conried III., and the king of France, Louis VII. They collected about 140,000 men, and in 1147 led them to the East. Notwithstanding the enthusiasm with which this crusade had been entered upon, for it is recorded that after Bernard's sermon, it happened more than once, that enough crosses not having been provided for all those who wished to assume the cross, that is, to promise to go on the crusade, Bernard had to cut up his garments in order to supply them, the army failed of its purpose of recapturing Edessa, and indeed only served by its presence still further to weaken the already almost tottering kingdom of Jerusalem. The crusading armies returned to Europe in 1149, and it was nearly 50 years before any other attempt was made to diminish the domination of the Saracens.

Third Crusade.—In 1187, Saladin took Jerusalem from the Christians and the zeal of the West blazed out once more. The three principal monarchs of Europe, Frederick Barbarossa, emperor of Germany, Philippe Augustus, king of France, and Richard Cœur de Lion, of England, offered to lead their armies in person against the Saracens. Frederick's army succeeded in reaching the Holy Land only after having overcome an immense Turkish army at Philomelium, 7 May 1190. Not long after his victory Barbarossa was drowned in the river Kalykadnos, and this took all the spirit out of his troops. His son Frederick led the army to the siege of Acre, but after his death, in January 1191, the German army abandoned the expedition. Philip and Richard agreed to unite their forces at Messina, in Sicily. Here they stayed until the spring of 1191. Philip reached the Holy Land on the day

before Easter and joined the other Crusaders before Acre. Richard's fleet was dispersed by a violent storm, and his wife and mother were detained as prisoners on the Island of Cyprus, to which their vessel had been driven, by Isaac Comnenus, the heartless, despotic ruler of the island. On Richard's arrival from Rhodes, where his vessel had been compelled to put in, he succeeded in taking Isaac and his daughter prisoners and had himself proclaimed king of Cyprus. 'Twas not until the beginning of June that he joined the French at Acre. Owing to jealousies between the two monarchs, the French king abandoned the expedition shortly after the fall of Acre. Richard succeeded in many wonderful exploits against the Saracens, but was not able to accomplish much in regaining territory. He did not succeed in recapturing Jerusalem, and, though he defeated Saladin at Azsoof and captured Jaffa, he at last despaired of the capture of Jerusalem and made a truce with Saladin by which the sea-coast from Tyre to Jaffa remained in the possession of the Crusaders, and Christians were allowed full liberty to visit the Holy Sepulchre.

The Fourth Crusade was due to the zeal of Pope Innocent III. Its chief promoters were Godfrey of Champagne, Baldwin, Count of Flanders, and Dandolo, the old Doge of Venice. The Marquis of Monteferrat was chosen leader of the expedition. The Crusaders assembled at Venice and were induced by Dandolo to attack Zara in Dalmatia, a town which had formerly belonged to the Venetians but which had renounced its allegiance. This was contrary to the wish of the Pope, who excommunicated the Crusaders for their failure to fulfil their vow of proceeding to the Holy Land. News now came to the Crusaders' camp that there was a revolution in Constantinople and their aid was asked for one of the claimants to the throne. Dandolo seems to have been mainly responsible for encouraging the Crusaders to accept the invitation to proceed to Constantinople, and as a result the crusade was entirely diverted from its original purpose. In 1203, Constantinople was taken by the Crusaders, who established therein a Latin empire.

Children's Crusade.—The failure of so many expeditions to the Holy Land proved very discouraging and people began to wonder if there was not some cardinal fault in the make-up of the parties that went on the Crusade. It began to be said that the Holy Land would never be captured, except by those who were innocent. Accordingly, when Stephen, a French peasant boy, in June 1212, began to preach a children's crusade, he made many converts to his opinion that possibly children might accomplish what adults had failed in. Some thirty thousand French children are said to have taken part in the expedition. A like movement began in Germany and soon proved to have almost as great a following. Over 20,000 German children crossed the Alps into Italy. Both expeditions, as might have been expected, came to grief. The French children were tempted on board vessels by designing slave merchants in Marseilles, and many of them were sold into slavery. Many of the German children lost their lives through the hardships they had to endure on the march. Some were lost at sea and some settled down here and there throughout Italy.

These expeditions represent a phase of that tendency to psychic contagion that sometimes comes over even intelligent people in an inexplicable way, and it is from this standpoint that they have been very much discussed in recent years. The Children's Crusade corresponds to the witch baiting of more modern times, or to some of the many spiritual manifestations of older periods. Some doubts have been thrown on phases of the history of the Children's Crusade, as for instance the fate of the French children, but there seems good reason to believe the account given here to be correct. (See Winkelmann, 'Geschichte Kaiser Frederichs II.,' and Röhricht's article in 'Sybels Histor. Zeitschrift,' 1876.) In English there is the popular account by Gray, 'The Children's Crusade,' New York 1871, and in French, 'Des Essard's La croisade des enfants,' Paris 1875.

Fifth Crusade.—After an interlude of five years, after the Children's Crusade, a Hungarian expedition went to Egypt and captured Damietta. There was so much disaffection among the Crusaders themselves, however, that the expedition had to be abandoned. This is sometimes spoken of as the Fifth Crusade. What is more usually called the Fifth Crusade was led by Frederick II. of Germany and owed its inception to Pope Honorius II. and to Pope Gregory IX. A pestilence broke out in the army just as it was ready to sail and this delayed the expedition. Frederick seems to have lost heart after this and retired to Pozzuoli, near Naples, thus incurring the displeasure of Pope Gregory IX., who put him under a ban of excommunication. The next year, nevertheless, Frederick went to the Holy Land and without giving battle succeeded by negotiation with the Sultan in securing for himself the Kingdom of Judea, only on condition, however, of tolerating in this kingdom the Mohammedan religion. He was crowned king and concluded a truce with the Sultan for ten years; but this was soon broken.

The Sixth and Seventh crusades were led by St. Louis IX. of France. He considered that the centre of the Moslem dominion was in Egypt and he resolved to strike his blow there. He laid siege to Damietta and captured the city in June 1249. In his march up the Nile, however, his army became involved in the mazes of swamp and streams of the river and was defeated. Forced to retreat, it was overtaken by the army of the Sultan, where resistance was hopeless, and the king and his whole army had to surrender. Louis's ransom was the city of Damietta. After waiting for a time for reinforcements, he returned home. Twenty years later the saintly king undertook the Seventh Crusade. He landed his army in 1270 on the northern coast of Africa and after a large number of his knights had perished, he himself died before Tunis. Peace was concluded and the French Crusaders returned home. About the same time an English army under Prince Edward, afterward Edward I., proceeded to Syria. Finding that little could be accomplished, they concluded a truce for ten years and then returned to England. For about twenty years after this, the remnants of the Latin kingdom in Palestine succeeded in maintaining themselves independent. Acre was captured by the Sultan of Egypt in 1291, just one

hundred years after it had been originally taken by Richard Cœur de Lion, and this obliterated the last remnant of the kingdom that had been founded by the Crusaders.

The results and significance of the crusades for western Europe and, indeed, for the civilized world of all after times, are out of all proportion to the little that was accomplished in Palestine. The result of the intercommunication of nations caused by a series of joint enterprises, could scarcely fail to bring with it broadening of views and the intellectual development consequent upon friction of minds trained so differently. In merely material progress, the most noteworthy effect was upon commerce. The use of many Eastern luxuries was introduced into Europe and as a result, the cities of Italy especially acquired commercial importance. The commercial spirit thus aroused and the impetus of the later crusades gave rise to the Hanseatic League, which marks the first great step in modern commercial progress. In every branch of art and knowledge the effect of the crusades soon became evident. There has been in recent times a renewed interest in the 13th century. There are some who do not hesitate to say that the thirteenth is one of the greatest of centuries because of what it represents of accomplishment in the arts and of development of the human mind as well as the rise of human liberty. Nearly all of the movements that led up to such accomplishment can be traced to the crusades. In the East, the Europeans had come in contact with Arabian philosophy and Arabian mathematics, and the consequence was an interest in these subjects that spread very widely and that eventually gave rise to the university and even to the development of such advanced physical science as was taught by Albertus Magnus and Roger Bacon. The interest of the Crusaders in Byzantine architecture and arts led to the development of a taste that soon created a demand that must be satisfied. Gothic architecture has been traced to Eastern influences. The other great arts of the 13th century, statuary, stained glass working, book illumination, metal working in its various forms and needlework, all owe their inspiration to Eastern sources. That they were developed quite beyond the models that had been seen by Europeans is due to the fact that the generations following the crusades had traditions of accomplishment that led them to raise their genius to the highest possible point of accomplishment. Great political benefits in the crusades must not be overlooked. Many of the nobility lost their lives and many more lost their fortunes and their power, and as a consequence government became more centralized and national. This was especially true in France, and as a consequence peace was easier to maintain. The honors conferred on many of the Crusaders gave them opportunities to rise such as they would not otherwise have had. The distribution of wealth brought about by the heavy expenses that were incurred gave opportunities for many of the poorer classes to enter into industrial and commercial occupations. The very independence of mind that had been acquired by the distant expeditions created a spirit of enterprise and made men much more ready to try far-off adventures and even commercial speculations, than was the case before. Undoubtedly to the crusades is owed more of what is distinctive in modern Europe than to any other connected series of human events.

New York City.

Crushing and Grinding Machinery. These machines are employed to reduce hard or fibrous substances to a fragmentary condition, or to the form of a fine powder.

Crushing machines are used for purposes of coarse reduction. They consist of various forms of "stamps" or stamp-mills, crushing rolls, gyratory crushers, etc., and are employed to reduce metal ores for subsequent treatment by the processes of amalgamation and concentration; for crushing sugar cane and other fibrous materials, and for crushing coal and coke.

For preliminary crushing, that is, for preparing material for finer crushing by various forms of stamps, rolls, and rotary mills such as those described in detail under the title "MINING AND MILLING MACHINERY," the types of machines usually employed are the jaw crushers and the gyratory crushers. Of the former, the "Blake," the "Dodge," and the "Buchanan" crushers are among the most familiar and extensively used types.

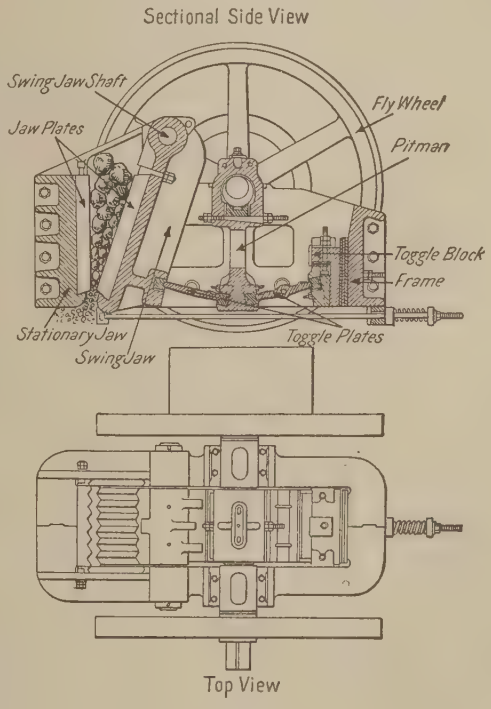

FIG. 1.

Fig. 1 illustrates a vertical section and a top view of a "Buchanan" stone crusher. It consists of a cast steel frame carrying two steel jaws, one fixed and one movable, which are arranged to form a V-shaped opening. The movable or swing jaw is hinged at the top and is connected with suitable mechanism by which

it is alternately pushed forward and backward, to and from the fixed jaw, thus alternately reducing and enlarging the V-shaped opening. The material to be crushed is introduced at the top of the opening, and is reduced by the reciprocating motion of the swing jaw to a size fine enough to allow it to pass through the smaller outlet at the bottom of the opening. The adjustment to crush fine or coarse is made by means of removable steel liners placed between the planed surfaces of the frame and the main toggle block. The stroke is adjusted by means of jaw liners of steel placed between the top of the main toggle bearing and the bottom of the steel lugs cast on the frame so that the angle of the toggle can be increased for lengthening the stroke, or it may be flattened to diminish the same. For increasing the stroke one or more liners are added, and by this means a variation of about fifty per cent is obtained in the throw of the jaw. The receiving openings of these crushers range in size from 1½ x 3 inches to 24 x 30 inches; their weight ranges from 160 to 60,000 pounds; they require from 4 to 65 horsepower to operate them at 250 revolutions per minute, and are capable of reducing the rock supplied to them into fragments ranging from 1 to 3 inches in size at a rate ranging from 4 to 35 tons per hour, according to the size of the machines. The capacity of a rock breaker depends on the distance between the jaws, and the number of revolutions of the power wheel. The amount of product is also affected by the kind of rock, the hard, brittle variety will go through faster than the sandstones and other tough rock. The accompanying table of "Relative Hardness of Elements and Ores" will serve to give a general idea of the relative powers required to crush them. It is important to note, however, that the power required will depend very much on the relative proportions of the mineral to the gangue matter; for example, galena may occur in a quartz gangue, and if the proportion of galena is very large, the hardness of the ore will be near the scale for galena as shown in the table; but, if the proportion is very small, the hardness of the ore will be near the scale for quartz.

RELATIVE HARDNESS OF ELEMENTS AND ORES.

Element or Ore	Character	Hardness
Diamond	Brittle	10
Iron	Malleable	4 to 5
Platinum	Malleable	4 to 4.5
Arsenic	Brittle	3.5
Antimony	Brittle	3 to 3.5
Gold	Malleable	2.5 to 3
Silver	Malleable	2.5 to 3
Copper	Malleable	2.5 to 3
Bismuth	Brittle	2 to 2.5
Sulphur	Brittle	1.5 to 2
Lead	Brittle	1.5
Graphite	Inelastic	1 to 2
Corundum	Brittle to tough	9
Beryl	Brittle	7.5 to 8
Wolfram	Brittle	7.2 to 7.5
Quartz	Brittle to tough	7
Garnet	Friable to tough	6.5 to 7.5
Iron Pyrite	Brittle	6 to 6.5
Magnetic Iron Ore	Brittle	5.5 to 6.5
Copper Pyrites	Brittle	3.5 to 4
Mispickel	Brittle	5.5 to 6
Hornblende	Brittle	5 to 6
Fluor Spar	Brittle	4
Magnetic Pyrite	Brittle	3.5 to 4
Dolomite	Brittle	3.5 to 4
Spathic Iron	Brittle	3.5 to 4
Malachite	Brittle	3.5 to 4
Mica	Laminated	2.2 to 5
Gray Copper	Rather Brittle	3 to 4
Cerrusite	Very Brittle	3 to 3.5
Heavy Spar	Brittle	2 to 2.5
Copper Glance	Brittle	2.5 to 3.5
Galena	Brittle	2.5 to 3
Ruby Silver Ore	Brittle	2.5 to 2.75
Silver Glance	Malleable	2.5
Sylvanite	Brittle	1.5 to 2
Talc	Inelastic	1 to 1.5

Compounds of the heavy metals, such as gold, silver, copper, lead, etc., are soft, their hardness rarely exceeding 2.5 to 3; while that of the compounds of the arsenides and oxides of iron, nickel and cobalt, are relatively hard, ranging from 6 to 6.5. Most of the sulphides, carbonates, sulphates and phosphates are soft. The conspicuously hard minerals are found chiefly among the oxides and silicates. The weights of the various ores differ within very wide limits. A spongy dry quartz containing very little metallic sulphurets is naturally much lighter than a wet dense quartz heavily charged with galena. Broken quartz sent to the mill generally ranges from 15 to 22 cubic feet per ton, and a convenient size of truck for handling the same is one having a capacity of about half a ton.

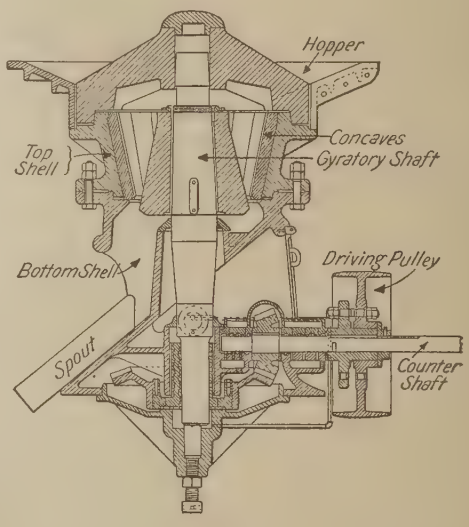

FIG. 2.

Gyratory Crushers.— In these machines, the crushing elements consist of an inverted hollow frustrum of a cone within which an upright frustrum of a solid cone is given a gyratory motion by a vertical shaft connected with a counter shaft operated by a suitable propelling mechanism. The vertical shaft is hinged at the top, and the material dumped into the hopper is crushed in the annular space between the walls of the two cones until it is fine enough to pass down and out of the openings at the bottom. The McCully and the Austin gyratory crushers are among the best representatives of this class of machines. Fig. 2 illus-

trates a vertical cross section of the Austin crusher. These machines are adapted to produce a much finer grade of crushed material than those of the jaw crusher type.

Crushing rolls are made in a great variety of forms, and are used for the production of a

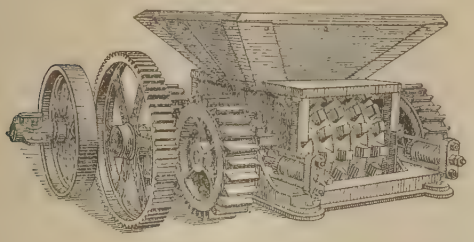

Fig. 3.

much finer grade of crushed material than that obtained by the use of the machines already described. In some of them the rolls are equipped with removable steel teeth. Such ma-

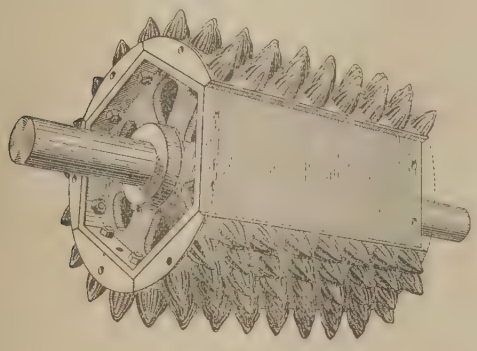

Fig. 4.

chines are used by the smelters for the coarse crushing of slag shells from slag cars and pots. Other forms have corrugated rolls, while the coal crushers and the coke crushers and sizers

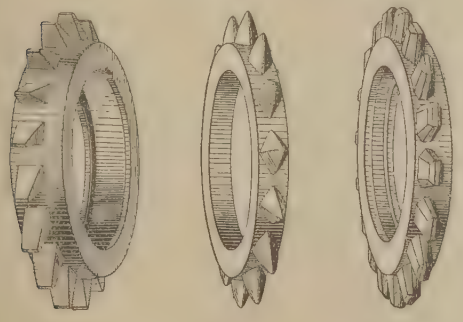

Fig. 5.

have rolls equipped with teeth of special design adapted for the crushing and sizing of the product according to the sizes demanded by the industrial and commercial trades. Coal crushers are described in detail under the title "Coal Mining Machinery," while Fig. 3 illustrates a "Jeffrey" coke crusher and sizer. It is equipped with a feed hopper the form of which may be arranged to suit any required condition, and the rolls are made in segments with removable teeth, as shown by Fig. 4, or of interchangeable tooth rings, as shown in Fig. 5.

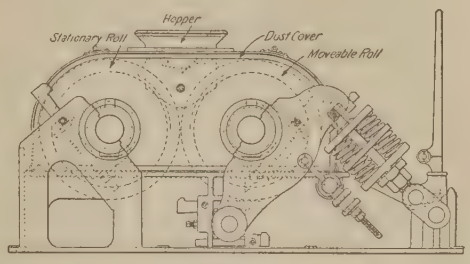

Fig. 6.

An external view of a set of plain crushing rolls is given in the article under the title Mining and Milling Machinery, together with a general description of the same, but Fig. 6, showing a sectional view of a "Humphreys" crushing rolls, is introduced here to convey a more detailed idea of the internal arrangement of the principal parts of these machines. Va-

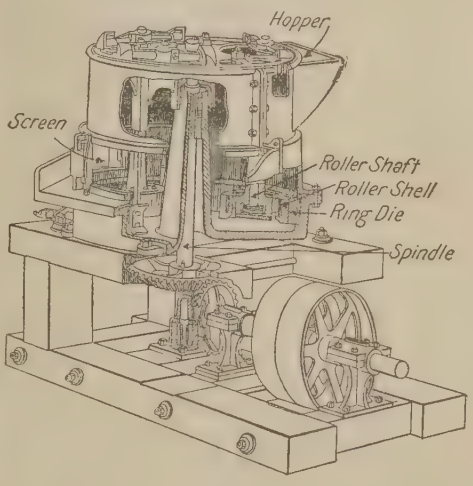

Fig. 7.

rious forms of roll crushers are also used for crushing sugar cane and other fibrous materials.

Other forms of crushers in common use are the "coffee mills," which, while resembling the gyratory crushers, yet differ from them in that the vertical shaft has only a simple rotary motion without gyration; the "edge runner" crushers consisting of a vertical axle which carries a number of radial arms with heavy metal wheels attached to their outer ends. The rotation of the vertical axle causes these wheels to travel in a circular track on the bottom of a metal trough containing the material to be crushed; and sausage mills consisting of a longitudinal shaft carrying radial teeth which

intermesh with similar teeth projecting from the inside of the cylindrical containing shell.

Grinding and pulverizing machines are used in many processes to reduce the products of the crushers. They are commonly known as mills, and are necessarily of a different character and of lighter construction than the crushing machines.

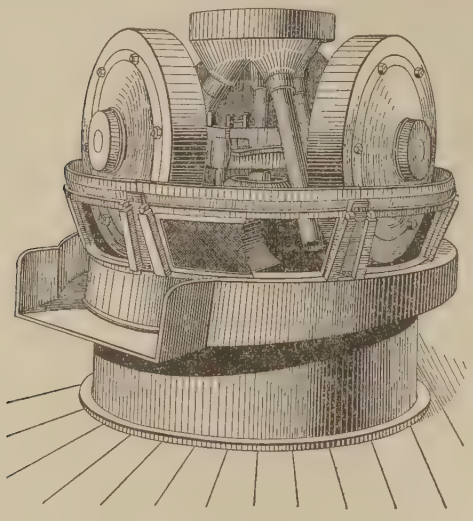

Fig. 8.

In the simple mill-stone mill, two stones set vertically one above the other, one fixed and the other rotated by a vertical shaft, are placed face to face. Usually the upper stone is the movable one, and has a central hole into which the material to be ground is fed. As this stone is revolved, the material is ground between the stones and passes out through grooves in their faces to the edge, where it is caught by a suitable receiver.

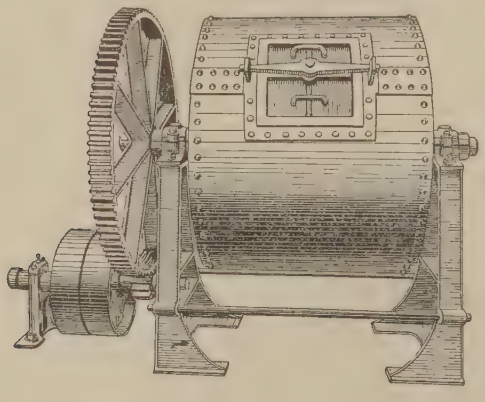

Fig. 9.

The best representatives of the ore-grinding machines are the "Huntington" and the "Chilian" mills. Fig. 7 shows a partly sectional detailed view of a Huntington mill. The ore and water fed into the mill at the hopper is thrown against the ring-die by the rotating rollers and scrapers, where it is crushed by the centrifugal force of the rollers to any desired degree of fineness, and then discharged through the screens in the form of a fine pulp suitable for concentration.

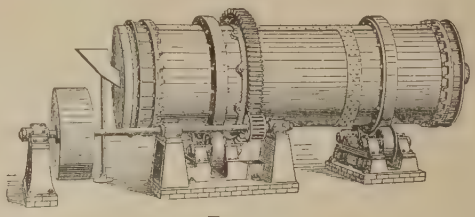

Fig. 10.

Fig. 8 illustrates a "Davis" Chilian mill. It consists of a heavy cast iron pan with an annular die. The periphery of the pan is provided with screens. A vertical driving shaft is journaled in the centre of the pan and is driven from below by bevel gears on a countershaft connected with the driving pulley. Three crushing rolls are driven from the vertical shaft by axle bearings so designed as to allow the rollers to swing in a vertical plane. The material to be crushed is delivered into a central hopper carried on the driving shaft, and is distributed by suitable spouts in front of each roll. Scrapers are provided to prevent packing, and ensure proper circulation for the screens.

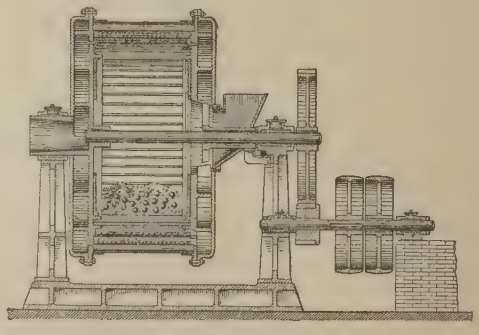

Fig. 11.

Other forms of machines used for fine grinding are the "pebble mills," "tube mills," and "ball mills." Of these, there are two principal types — those in which metallic balls of hardened steel, comparatively large in size, travel around a fixed track, and those in which the balls revolve loosely in a rotating drum. In the former, the material is ground between the rotating balls and the path on which they travel, and in the latter, by the constant movement and fall of the balls which are fed into the mill with the material. In many forms of these machines pebbles of flint are substituted for the balls of hardened steel.

Fig. 9 illustrates the general form of a pebble mill. The principal dimensions are as follows: The size of the cylinders range from 30 x 19 inches to 6 x 8 feet; the charge, taking

sand as the unit of measure, ranges from 120 to 4,000 pounds; and the size of pulleys range

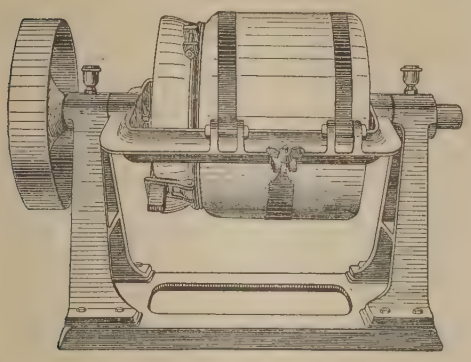

Fig. 12.

from 24 x 4 inches to 36 x 12 inches in diameter. These machines require from one to eighteen horsepower to drive them in dry-grinding, and from one-half to nine horsepower, in wet-grinding, at cylinder speeds ranging from 44 to 13 revolutions per minute.

Fig. 10 illustrates a tube mill of the ordinary type. The general principle of grinding employed is similar to that of the pebble mills, but with the difference that the material to be ground in the tube mill is fed at one end, and delivered as a finished product at the other end, its fineness being regulated simply by the speed at which the material is fed into the machine. As every particle of the material must pass under the grinding action of the entire charge of pebbles, a thorough and uniform grinding is the result, and the use of sieves is unnecessary.

Fig. 11 shows a vertical cross-section of an «Abbe» ball mill.

Jar-mills, consisting of porcelain jars in which pebbles are rotated together with the material to be ground, are extensively used for the grinding of paints, ink, and other chemical compounds. They are composed of one or more grinding jars. Fig. 12 shows a machine of the single jar type. Its outside dimensions are about 12 x 13 inches; it uses a charge of porcelain balls weighing about 22 pounds; and is capable of grinding up to 15 pounds at a charge, when running at 50 revolutions per minute.

Impact Pulverizing Machines are represented by the «Max» mills and various forms of «Raymond» pulverizers. The principle employed is that of percussion, the working device consisting of a vertical shaft attached to a carrier provided with hardened steel beaters. As the material is fed into the mill it is thrown by centrifugal force against a hard iron plate, the particles at the same time being thrown into violent contact with each other. Equipped with vacuum air separators they are extensively and economically used for the reduction of all kinds of dry colors and chemicals, and for the threshing, cleaning, and separating of tobacco stems.

The mechanical apparatus required to effectively apply this system of air separation should be capable of satisfying the following conditions: (1) To expand and rarify the air so that the coarser particles will fall out of the current and allow it to deliver the impalpable powder at the discharge spout. (2) When a large output of the finely ground material is required per hour, the apparatus should be capable of using an amount of air sufficient to lift the total weight of the charge of raw material. (3) When using a large volume of air, sufficient room should be provided for its expansion and rarefication so as to obtain a current light enough to carry away the impalable

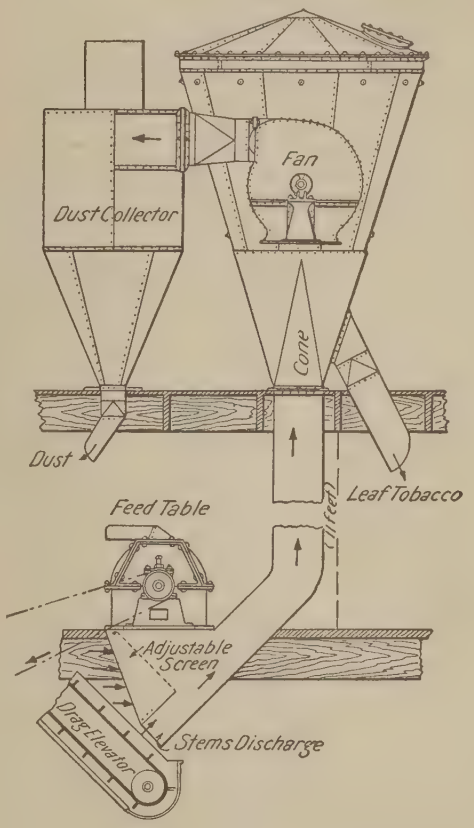

Fig. 13.

powder only. (4) The apparatus should be so constructed that the coarse particles will fall out of the light air current by gravity into the contracted portion of the separator where the blast is stronger, and thus pass out through the tailing spout or into the pulverizer to be reground, without being accompanied by any of the fine powder. (5) The air space within the apparatus should approach as near as possible to a perfect vacuum.

As the fineness of the product depends upon the size of the separator, almost any limit of grinding is readily obtained by making the apparatus of sufficient size to produce the proper relative expansion and rarefication of the air. When it is desired that the finished product should be an extremely fine powder, the use of

the large-sized separators will give the best results; but, for products of medium grades of fineness, and large output, the smaller ma-

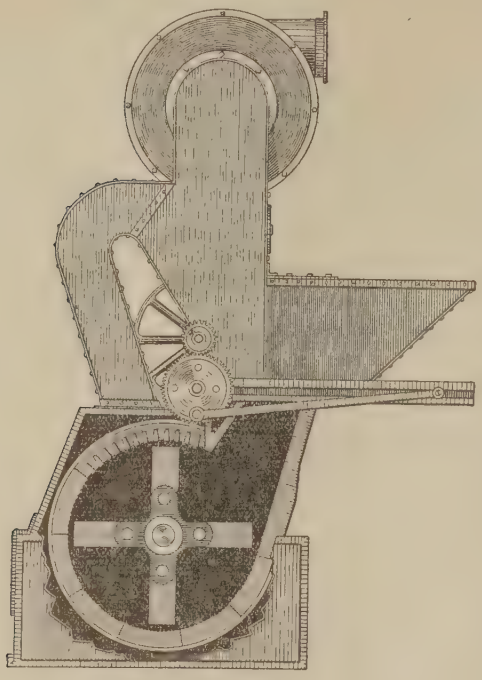

Fig. 14.

chines with fan and dust collector attachments are the most effective.

Fig. 13 illustrates a Raymond impact pulverizer and vacuum separating plant as erected for the cleaning and separating of tobacco stems. The material is fed to the machine by the operator in a manner similar to the feeding of a threshing machine. The perforations of the screen surrounding the pulverizing cylinder vary in size in proportion to the fineness desired. As the stems come in contact with the rapidly revolving beaters, the particles of the leaf are liberated therefrom, and passing through the screens with the stems are caught by the air current and drawn up into the separator, which expands the air so that all the light pieces of stems drop back and are discharged through the opening at the bottom into the drag elevator. The particles of leaf drop into the centre cone of the separator and discharge from the spout, while the dust is carried through the fan into the dust collector and discharged therefrom.

Fig. 14 shows the general arrangement of a type of pulverizing machinery called shredders, which are extensively used in tanneries, paper mills, chemical works, tobacco factories, and extract plants. The shredding of the material is accomplished by the wearing action of the hammers attached to the revolving shaft, against the teeth on the inner surface of the cylinder. For the separation of material reduced to a fine powder an exhaust fan carries the material through the outlet to the receiving receptacle.

Arrastra Machinery.— Arrastra plants are employed for the reduction of metallic ores into a fine pulp which is subsequently treated by the patio or some other process and the pure metal separated from the accompanying impurities. The bottom of the arrastra is paved with stones 10 x 10 inches square, made of the best granite and set vertically to the depth of about three feet in the ground. The outside is constructed of flat stones which project from eighteen to thirty inches above the floor. Line shafts driven by engine power extend over this floor and operate poles or arms which revolve and move the «dragging stones» over the granite floor and thus accomplish the reduction of the ore fed into the arrastra to a fine pulp. These stones are made of the best granite, and range in weight from 11,000 to 25,000 pounds. The ore is first prepared by being passed through the jaw-crushers of a primary crushing plant. From these machines it passes through a set of crushing rolls and is dropped automatically into revolving screens which separate the fine pulp from the coarser grindings. The last-named material is sent back and passed again through the crushing rolls until all of the pulp is fine enough to be finally treated in the arrastra. Each arrastra requires about six horsepower for its operation, and range in crushing capacity from six to ten tons each, per twenty-four hours, according to the character of the ore.

For other forms of crushing and grinding machinery, and their special application, see articles under the titles Brick Making Machinery, Coal Mining Machinery, and Mining and Milling Machinery, in this Encyclopædia.

William Morey, Jr., C. E.,
Consulting Civil and Mechanical Engineer, New York City.

Crusius, Christian August, German theologian and philosopher: b. Leuna, near Merseburg, 10 Jan. 1715; d. Leipsic 18 Oct. 1775. He received his education at Leipsic, where later he became professor of theology, a position which he held until his death. He vigorously attacked the philosophy of Leibnitz and Wolf as being incompatible with the dogmas of the Christian Church, and at the same time put forth his own philosophy, which he claimed to be perfectly orthodox. His philosophy subordinated the scholastic principle of contradiction to that of conceptibility; gave to the soul faculties and liberties almost as limitless as those of the Deity; propounded psychology as the basis for logic; and regarded time and space as modes of divine existence and not as substances. Among his works the most important are: 'Entwurf der nothwendigen Vernunftwahrheiten' (1745); 'Logik, oder weg zur Gewissheit und Zuverlössigkeit der menschlichen Erkenntniss' (1747); 'Anleitung über natürliche Begebenheiten ordentlich und vorsichtig zu denken' (1774).

Crusius, Otto, German philologist: b. Hanover 20 Dec. 1857. He has been a professor in the University of Heidelberg and has written: 'Zur griechischen Religiousgechichte' (1886); 'Untersuchungen zu den Mimiamben des Herondas' (1892); and has also edited 'Philologus; Herondas' (1901); 'Fabeln des Babrius' (1897); 'Griechische Lyriker' (1897); etc.

Crustacea, krŭs-tā'shĕ-a, a primary group (phylum) of animals represented by the bar-

shwater Shrimp. [20] Hermit Screw. [21] Caprella. [22] Isopod. [23] Wood-Louse. [24] Sphæroma.
Apus, or Shield-Shrimp. [30] Water-Flea. [31] Cypria. [32] Cyclops.

nacle, lobster, crayfish, shrimp, and crab. Crustacea differ from other arthropod animals. The body consists of about 20 segments which in the more specialized forms are grouped into two regions, the head-thorax (cephalothorax) and hind-body or abdomen. The segments of the cephalothorax are fused together so that the limits between the segments are lost, and the whole mass is protected by the shield or carapace. The skin is thick and rendered solid by the deposition of lime (carbonate and phosphate), so that the integument forms a dense crust, hence the name Crustacea. They differ from trilobites and king crabs (qq.v.) in having two pairs of antennæ, while they breathe by means of gills attached to the legs. Like the other marine arthropods named, they have legs which are divided into two divisions, an outer (exopodite) and an inner (endopodite). Crustacea differ from the *Palæopoda* also (trilobites, merostomes and arachnids) in the high degree of specialization of their appendages, there being from three to six kinds, with corresponding functions, while in the trilobites, so far as we know, the single pair of antennæ are succeeded by numerous (over 20) pairs of legs, all of the same shape and functions. In the head-thorax, besides the antennæ, there is on each side of the mouth a pair of mandibles, each with a palpus, two pairs of maxillæ or accessory jaws, which are flat, divided into lobes, and of unequal size; three pairs of foot-jaws (maxillipedes), which differ from the maxillæ in having gills like those on the five following pairs of legs. There are thus 13 pairs of cephalothoracic appendages, indicating that there are 13 corresponding segments; these, with the seven abdominal segments, indicate that there are 20 segments in a typical crustacean. There are six pairs of swimming legs (swimmerets), the last very broad in the lobster and shrimp, with the telson forming the "tail-fin."

The Crustacea as a rule respire by gills. These, as in the lobster and crab, are composed of a series of little filaments into which the blood flows to be aërated. The filaments branch out from a common stalk which grows out of the basal joint of the five pairs of legs and the three pairs of foot-jaws. These gills are folded up toward the back, and are contained in a sort of chamber made in part by the carapace. In shrimps, lobsters, and crabs the sea-water passing into the cavity between the body and the free edge of the carapace is afterward scooped out through an opening or passage on each side of the head by the movements of membranous flaps called "gill-bailers." The digestive organs are well developed, especially the fore stomach, in the hinder part of which are several very large calcareous teeth for crushing the food, serving, when closed together, as a strainer through which the partly digested food presses into the long slender straight intestine, which ends in the telson. The liver is very large, as in all marine arthropods, or in such terrestrial types as the scorpions and spiders, which are derived from the king crabs. The brain of the higher Crustacea is very complex, corresponding with the complicated reflex movements of an animal composed of so many segments, and bearing such a complicated series of appendages devoted to so great a variety of functions. The eyes are usually compound or many-faceted, and are mounted on freely movable stalks. The ear is a sac in the basal joint of the smaller or second pair of antennæ. The organs of smell are usually well developed, as Crustacea mainly depend on this sense in finding their food. These consist of minute delicate sensory rods on the smaller antennæ. The hairs fringing the mouth-parts and legs are often delicate tactile organs. The green glands in the head function as kidneys, and open out at the base of the larger antennæ.

With only a single known exception (*Squilla*), Crustacea carry their eggs about attached to the swimming or other legs. The eggs of some crabs (*Neptunus*) are minute and excessively numerous, their number amounting to millions, while the lobster may produce from 20,000 to 80,000 eggs. Crustacea pass through a well-marked metamorphosis, nearly all (except the amphipods and isopods) hatch from the egg as a larva called a "nauplius," which has an oval non-segmented body, with three pairs of appendages, by which it swims about at the surface of the sea. After a series of molts, at each of which new segments with their appendages arise, they finally reach maturity. The shrimps and crabs hatch in a more advanced larval stage called the zoëa, the nauplius stage being partly suppressed and thrust back into the embryo period. The zoëa has a head and abdomen, but no thorax: this, however, is developed later, and after a series of molts the parent form is attained.

The process of molting is a precarious one, not infrequently resulting in death. The crust being too solid to admit of a continuous growth, and increase in size being rapid, frequent sheddings of the skin are necessary. In the lobster, the old skin being detached from the under cellular layer by the secretion of the new cuticle beneath, it ruptures between the thorax and abdomen, and the lobster draws itself out of the rent, shedding not only the entire skin and every hair, but also the lining of the mouth, throat, and fore stomach, and likewise the end of the intestine. In about three weeks after the casting of the shell the new one becomes solid and hard. In the crayfish the old skin is loosened and pushed away from the cellular layer beneath by the growth of temporary, short stiff hairs, which disappear after the skin is shed.

The Crustacea are a very ancient type. The earliest remains are found in the Cambrian rocks, but are very scanty compared with the trilobites. They comprise traces of barnacles, *Ostracoda* or small shelled forms, *Phyllocarida,* and an obscure form supposed to be allied to the modern freshwater *Apus.* In the Devonian Period shelled phyllopods (*Estheria*) appeared, while in the Carboniferous arose an order (*Syncarida*) represented by an ancient form (*Anaspides*) still living in a lake in Tasmania. From this group the existing *Schizopoda* or "opossum shrimps" (*Mysis*), the *Squilla,* and the ordinary shrimps and crabs, are supposed to have descended. *Isopoda* also appeared as early as the Devonian. A shrimp-like Crustacean occurs in the Devonian, and true crabs date from the Jurassic.

The Crustacea are divided into 11 orders, the *Branchiopoda, Phyllopoda, Ostracoda, Copepoda, Cirrepedia* or barnacles, *Arthrostraca, Cumacea, Phyllocarida, Syncarida, Schizopoda, Stomatopoda,* and *Decapoda.* There are over

5,000 species known. See BARNACLE; CRAB; FISH LICE; HERMIT CRAB; SHRIMP.

Crutched Friars. This order appeared in England in the 13th century, and had monasteries in London, Oxford, and Reigate. From the staff which they carried in their hand, on the top of which was a cross, they received the name croisiers, which soon was corrupted into "Crouched" or "Crutched" friars. A street in London bears this name.

Cruveilhier, krü'vā'li-ā', **Jean,** French anatomist: b. Limoges 9 Feb. 1791; d. Jussac 6 March 1874. He obtained in 1835 the chair of pathological anatomy created in Paris by Dupuytren. He published an important work on 'The Pathological Anatomy of the Human Body' (1829–40), and other works.

Cruz, Juana Ines de la, hoo-ä'nä ē-nēs' dā lä, Mexican poet: b. 12 Nov. 1651; d. 17 April 1695. Having retired from the viceregal court at the age of 17, she became a nun of the Hieronymite order, and devoted herself to poetry, music, and mathematics, leading at the same time a life of great austerity. Her writings consist of songs, dramas (all these except two on religious themes), prologues, and dramatic sacred allegories. Her contemporaries styled her "the Tenth Muse" and "the Mexican Phœnix."

Cruz, Ramon de la, rä'mōn dā lä krooth, Spanish dramatic poet: b. Madrid 1731; d. 1799. He rescued the native Spanish drama from an inundation of French influence. A marvelously prolific writer, he produced some 300 pieces in all departments of dramatic composition; but of them all only some interludes can now command attention; these are alive in every line, reflecting with absolute truth the life of the lowest orders.

Cruz, San Juan de la, sän hoo-än' dā lä, (Saint John of the Cross), Spanish mystic and poet: b. Fontiveros, Old Castile, 1542; d. Ubeda 14 Dec. 1591. He was a Carmelite friar, canonized in 1674. His prose writings on the inner life won for him the title "The Ecstatic Doctor"; famous among them is 'The Soul's Darksome Night.' In form and spirit his poetry is noble, deep, and inspired by profound feeling. His complete 'Spiritual Works' were first published in 1619, and in a 12th edition in 1703.

Cruz y Goyeneche, Luis de la, loo-ēs' dā lä kroos-ē-gō-yā-nā'chā, Chilean military officer: b. Concepcion 25 Aug. 1768; d. near Valparaiso 14 Oct. 1828. He bore a leading part in the revolution against Spain, commanding a regiment and falling into the hands of the enemy, but was liberated in 1817. He next became a political leader of the young republic, serving for a time as acting president of Chile. He was invested by Peru with the dignity of grand marshal.

Cruzado, kroo-zā'dō, or **Crusado,** a Portuguese coin. The old cruzado or cruzado-velho was worth 400 reis, 43 cents; the new cruzado, cruzado-novo or pinto, is worth 480 reis, 52 cents.

Cryolite, krī'ō-līt (Gr. "ice-stone," in allusion to its translucent whiteness), a native fluoride of aluminum and sodium, having the formula $3NaF.AlF_3$. It crystallizes in the monoclinic system, and also occurs massive. It is transparent or translucent, and the purer varieties are colorless or white. Its lustre is vitreous, and it has a hardness of 2.5 and a specific gravity of about 3. The best-known deposit of cryolite is in West Greenland, whence large quantities of it have been taken for use in the preparation of metallic aluminum (q.v.). Less important deposits are also known in the Urals, and in El Paso County, Col. Cryolite is also used in the manufacture of alum, soda, and certain kinds of glass, notably the so-called "milk-glass," or hot-cast porcelain, which is composed of cryolite, silica, and oxide of zinc.

Cryophorus, krī-ŏf'ō-rŭs (Gr. "ice-bearing"), a simple instrument devised by Wollaston for illustrating the freezing of water by rapid evaporation. The instrument consists of a bent tube of glass, provided with a bulb at each end. A small quantity of water is placed in it, and boiled until the air is entirely expelled and replaced by steam. The tube is then hermetically sealed. In using the instrument, the water is brought into one of the bulbs, and the other, containing only water-vapor, is placed in a freezing mixture. The vapor condenses rapidly in the chilled bulb, and a correspondingly rapid evaporation is induced in the other one. The formation of vapor, however, is attended by the absorption of large quantities of heat; and the water in the free end of the apparatus, being the chief source from which this heat is obtained, presently becomes chilled to such a degree that it freezes.

Crypt, in architecture, a cell or vault constructed underground. The underground tombs of the Christian martyrs were so called, where the early Christians met to perform their devotions, for fear of persecution. Hence crypt came to signify a church underground, or the lower story of a church, which may be set apart for monumental purposes, or used as a chapel. The crypt is not common in churches built after the Norman period and when found in those of the Gothic period is usually much older than the structure above them. The usual position of a crypt is beneath the choir, but occasionally, as at Glasgow Cathedral, beneath the transept also. The largest crypt in England is that at Canterbury Cathedral. Crypts rarely occur as a feature of a parish church. The larger crypt at Glasgow Cathedral is entirely above ground and at one time was used by itself as a church.

Cryptidine, krĭp'tĭ-dīn ($C_{11}H_{11}N$), a base homologous with quinoline, obtained in the preparation of that body, and also found in the less volatile parts of coal-tar. Its boiling-point is about 525° F., but it has not yet been prepared perfectly free from its lower homologues. It forms a double salt with platinum.

Cryptobranchidæ, krĭp to-brăn'kĭ-dē (Gr. "with hidden gills"), a family of urodele *Amphibia* (q.v.) most nearly related, according to Cope, to the *Amblystomidæ*. There are no gills in the adult, but a single pore-like branchial fissure may persist on each side. Respiration is pulmonary, but the inspirations occur only at intervals of several minutes. The vertebræ are biconcave but, like the remainder of the skeleton except the cartilaginous carpi and tarsi, are well ossified. There is no ethmoid bone, and the internal ear is separated from the brain by membrane only. A maxillary bone is developed, and teeth are borne on the margins of

DECAPOD CRUSTACEA.

1. An East Indian edible crab (Podophthalmus vigil).
2. East Indian sping crab (Parthenope horrida).
3. A Mediterranean crab (Pisa armata).
4. Three-angled Mediterranean crab (Gonoplax rhomboides).
5. Three-angled Atlantic crab (Pisolambrus nitidus).
6. East Indian shrimp (Stenopus hispidus).
7. Northern shrimp (Palæmon serratus).
8. A Mediterranean porcelain crab (Albunea symnista).
9. Cocoanut crab (Birgus latro).
10. Mediterranean purple crab (Lissa chiragra).

both jaws, as well as on the vomers, but not on the parasphenoid. The eyes are very small and devoid of lids; two pairs of limbs with four and five digits respectively are always present, and the tail is permanently provided with a fin. Two genera are known: *Megalobatrachus,* which has no branchial opening and contains only the giant salamander of eastern Asia, and *Cryptobranchus,* which contains the American hellbenders (q.v.).

Cryptog'amous Plants, or **Cryptog'ams** (from Gr. *κρυπτός,* hidden + *γάμος,* marriage), All plants below the Phanerogams or flowering plants. The names were first used by Linnæus, who may thus have indicated his conviction that all plants possess sexuality. (They do not.) For a long time the vegetable kingdom was divided into two groups, as follows: (1) *Phanerogamia,* with stamens, ovules, seeds, and embryos. (2) *Cryptogamia,* without stamens, ovules, seeds, and embryos, and with spores. These distinctions, although long since acknowledged to be unscientific, are still maintained, especially in popular usage. The Cryptogams, instead of being a single group co-ordinate with the Phanerogams, include several such groups, namely: Water-slimes (*Protophytes*); Spore-tangles (*Phycophytes* or *Algæ*); Fruit-tangles (*Carpophytes* or *Fungi*); Mossworts (*Bryophytes*); Fernworts (*Pteridophytes*).

Cryptograms. See CIPHER WRITING.

Cryptomeria, krĭp-tō-mē'rĭ-ą (Gr. "with hidden parts," its seeds being concealed in bracts), a beautiful tall-growing conifer, known also as the Japanese Cedar. The tree grows in the mountainous regions of China and Japan, and many varieties are cultivated. It was introduced into Europe in 1842, and is now widely cultivated. It is closely allied to the *Sequoia* (q.v.).

Crypturi, krĭp-tū'rī (Gr. "hidden tail," because of the rudimentary tail), an order of birds, sometimes called the *Tinami* or *Tinamiformes,* from their native name tinamou, generally regarded as *Ratitæ* (q.v.), but placed among the *Carinatæ* (q.v.) by those who regard the presence of a keeled sternum as of greater classificatory value than the desmognathous palate. Besides the characters just mentioned, which are combined in no other known birds, other remarkable osteological features are the complete union of the vomer and palatine bones, the single articular head of the quadrate, the rudimentary tail skeleton (pygostyle), the ostrich-like pelvis and legs (but not feet), and the well-developed clavicles, all but the last being ratite characters. The quill feathers of the tail are 10 or 12 in number and completely hidden beneath the coverts; the wings, which are very short and concave, have 10 primary and from 13 to 16 secondary quills; contour feathers are of the ordinary type found in flying birds, with the aftershaft rudimentary or absent. There are three long anterior toes with claws like a pheasant's, and the hallux is short and elevated, or, very rarely, absent; in fact the feet are of a strictly gallinaceous type. About 9 or 10 genera and 70 species are known, all but 6 of which are South American, occurring especially in Argentina and Brazil. See TINAMOU.

Crystal. The term crystal, derived from a Greek word signifying a hard crust, or more particularly ice, was applied by the Greeks at least 400 B.C. to a material which they supposed to be a hard, durable form of frozen water. This substance is the colorless, transparent variety of quartz still called rock crystal. The angular forms and the smooth, even surfaces of this substance were observed by the ancients, but were regarded either as accidents or as shapes "pleasing to the gods." Pliny says, "It is not easy to ascertain the reason why crystal is produced in six-sided prisms, especially since the terminations are not uniform."

By a natural association of ideas other minerals, such as beryl, diamond, garnet, and pyrite, which were observed to occur frequently in angular forms, were spoken of as crystal-like, or crystalline; the angular shapes which the alchemists obtained by evaporating different solutions were said to be the results of "crystallization," and when, toward the close of the 18th century, the study of the shapes was first systemmatically undertaken, Romé de l'Isle called the new science crystallography (q.v.). That is, the word crystal no longer meant the transparent, ice-like substance, rock crystal, but an individual solid of any substance, whether transparent or opaque, provided this solid was bounded by plane faces at definite angles, and was formed as a result of the solidification of the substance.

But even this third use of the term crystal does not appear to be the final one, for it rests fundamentally upon the idea of a polyhedral shape, a bounding by flat, even faces, and it is now generally admitted that external polyhedral shape is the direct consequence of a regular internal structure, and, although it is the most striking proof of this, it is often dependent upon comparatively minor conditions at the time of solidification. There is, however, a quality shown by all crystals which is also a consequence of the regular internal structure, and may be called "directional regularity"; that is, the physical characters of a crystal, such as transmission of light, the conductivity of heat, the cohesion, the elasticity, or the rate of solubility are always alike in parallel directions, and, generally speaking, unlike in directions which are not parallel. This directional regularity is shown not only by the individual plane-bounded solids called crystals, but by those much more frequent results of solidification which are of a shape determined by the space in which the solidification occurs, or may show here and there plane faces or grains with crystal outlines. Such masses are made up of individual portions, each with the same "directional regularity" as the separate so-called crystals.

The tendency now is to include all such individuals under the term crystal, one suggestion being to distinguish them as anhedral or faceless crystals, and the following definition of Fock expresses this tendency: A crystal is "a homogeneous solid body of definite chemical composition, whose physical properties are the same in parallel directions, but are generally different in directions not parallel." The outward sign is the form, but its destruction does not rob the fragments of their perfect internal structure, whereas the most perfect model is not a crystal, because it lacks the internal physical characteristics.

The External Form of Crystals. — Although

some differences between the shapes of crystals of different substances had been noticed and these differences utilized in descriptions of minerals and salts, the general belief, as late as the 16th century, was that the shapes in which any one substance occurred were neither constant nor related to each other.

In 1669 Nicolas Steno, a Danish anatomist, announced that the angles between corresponding faces of different quartz crystals were constant no matter how much the crystals varied in shape. This constancy of angles was stated by Guglielmini in 1704 to be general, in that every salt had its peculiar crystals, the angles of which were constant even when the crystals were imperfect and broken.

That in addition to the constancy of angles between corresponding faces there was an intimate relation between the very different shapes often assumed by crystals of the same substance, was first shown clearly by Romé de l'Isle, who, continuing the method of Linnæus, measured and made wooden models of different crystals and in 1783 described over four hundred regular forms. As a result of his comparisons de l'Isle found that differently shaped crystals of any one substance always formed a series and that all the members of such a series could be derived by "modifying" one so-called "primitive form," the shape and angles of which varied with the substance, by particular methods, such as replacing each edge by one plane or by two planes, or each solid angle by one, three, four or six planes.

So far apparently as de l'Isle observed, the modifying or secondary planes could be at any angle, provided they were grouped in the same way at each modified edge or angle. The Abbé Haüy, however, showed that the angles made by the secondary planes were not arbitrary, but always fulfilled certain conditions. Bergman in 1773 had shown that calcite could be cleaved or broken into little six-faced fragments with constant angles and that these rhombohedral fragments could be built together again into the different observed shapes of calcite, and Haüy developed a theory to explain the relations between the observed forms by assuming that this property of "cleavage" was a general one and that all crystals were built up of "integrant molecules" of the shape of the cleavage forms. Instead of the arbitrarily chosen primitive form of de l'Isle he chose for each substance a primitive form the faces of which were parallel to directions of cleavage, or if no cleavage was found or cleavage only in one direction, he assumed a shape determined by striations or other markings or by analogy between the shapes of the crystals of other substances which did show cleavage.

The secondary forms, that is, those with faces not parallel to cleavages, Haüy found he could build by placing successive layers of integrant molecules upon the faces of the primitive form, each successive layer regularly diminishing from the subtraction of one or more rows, always some simple rational number, never to his knowledge exceeding four. This is the basis of the fundamental law of rational parameters, which, stated in general terms, is: "*That the relative positions of crystal faces are not arbitrary. If any four independent faces of a crystal are fixed then the position of any other face must fulfill certain conditions.*"

Professor Weiss of Berlin in 1809 discarded Haüy's hypothesis of decreted rows and substituted the conception of imaginary axes "around which the crystal is uniformly disposed." He divided all crystals into groups dependent upon the relative inclinations of the axes. The primitive forms of Haüy he constructed by planes intersecting all the axes or parallel to one or to two of them. If a primitive form cut three axes at distances *a, b* and *c* from the centre, then all secondary forms could be constructed by taking points along each of the axes at twice, three times and four times, etc., the lengths *a, b* and *c,* and constructing planes in the same way as before. That is, the intercepts of any secondary face in terms of *a, b* and *c* were rational, such as $2a : b : 3c$ or $a : 3b : 2c$.

Symmetry, or the repetition of equal angles or similary grouped faces, was made a crystal character by de l'Isle in his statement, "Every face has an opposite parallel face." In any de l'Isle or Haüy series each form was derived by equivalent changes of *each* similar edge or angle of the primitive form, therefore without change of symmetry, that is, "All crystals of any one substance are of the same grade of symmetry." Hessel in 1830, Gadolin in 1864, and von Lang in 1867 considered the possible varieties of symmetry of polyhedrons when limited by the law of rational parameters. Each obtained 32 types or classes.

It may be said then briefly that, with respect to external form, the crystals of any one substance will have the same symmetry, which will be one of the 32 types, that the angles between corresponding faces will be constant, and that the possible shapes will constitute a series in which the positions of the faces are not arbitrary, but fulfill certain conditions (the law of rational parameters).

Ælotropism or Directional Regularity.—The effects produced by any physical test upon a crystal vary with the direction in which the test is applied. Like effects are obtained in directions which are either parallel or geometrically similar in the crystal and, generally, unlike effects are produced in directions neither parallel nor similar.

These facts were first suggested toward the close of the 17th century by the results of the studies of calcite made by Bartholin and Huyghens, which may be summed briefly as follows: A ray of light transmitted through calcite in any direction, except one, is doubly refracted, that is, split into two rays usually following different paths. This is shown easily by the fact that an object viewed through calcite appears double. In one direction, *which is also the direction of the principal axis of geometric symmetry,* there is single refraction only, and in all directions equally inclined to this direction of single refraction the double refraction (shown by the distance apart of the images) is the same. Finally, the two rays are no longer common light, but each is "polarized," that is, each is due to vibrations in one plane, one of the two planes of polarization being a plane through the direction of single refraction, the other a plane at right angles thereto.

If polarized light, in which the vibration direction is known, is transmitted through crystals, results are obtained by which the sym-

metry of the crystals may be accurately judged. For instance, with very primitive apparatus Brewster and others obtained before 1820 the so-called "interference figures," color rings of various shapes crossed by dark bands, and Brewster was able to classify nearly all those substances to which Haüy had assigned "primitive forms," in three optical classes, one yielding no color rings or cross, another yielding circular color rings and a constant black cross, the third yielding color rings in ellipses and figures eight with a black cross which merged on revolution into hyperbolæ. Furthermore, these results were obtained in particular crystallographic directions and the distribution of color and shape of the figures were symmetrical to the planes and axes of geometric symmetry of the crystals.

A striking proof of the relation between shape and optical behavior is shown when polarized light is transmitted through quartz crystals in the direction of the prism axis. In all such crystals the emerging ray is polarized in a different plane from the entering ray, or, as it is usually stated, quartz crystals rotate the plane of polarization a definite number of degrees, dependent upon the thickness. But when crystals of quartz which show the less common faces are examined it is seen by the arrangement of these faces that there are two sorts of crystals, the faces of which are relatively like the right and left hand, and Herschel and Brewster in 1821 showed that the plane of polarization was turned to the right by the one sort of quartz crystal and to the left by the other.

A very remarkable instance of directional regularity and its connection with external form is shown by crystals in which there are different groupings of planes about the opposite ends of certain axes. These axes are not only "polar" in the sense mentioned, but when the crystal is heated, one end of the axis becomes negatively electrified and the other end positively. This fact was observed in tourmaline crystals as early as 1762 by Æpinus and the same property is shown by calamine, boracite, quartz and other minerals and always with respect to an axis which shows different grouping of planes at the two ends.

That the cohesion of crystals varies with the direction and is equally strong parallel to all geometrically equivalent directions is indicated by several characters. For instance, the directions of least cohesion are frequently shown by the "cleavage" already mentioned under Haüy's discoveries. This cleavage is always equally easy at all parts of the crystal in the same direction and also equally easy parallel to geometrically similar directions, and if cleavage exists in three or more directions the resulting cleavage form is always a simple form of the same series to which the different crystals of the substance belong and usually it is a form of frequent occurrence.

The inequality of the cohesion, except in parallel and similar directions, may also be shown by the variations in hardness and by the cracks developed by punching or pressing with a conical point, and it is especially shown in the "unbuilding" of the crystal, which takes place under the action of a solvent. Solution proceeds with different velocities in different directions in the crystal and if stopped at an early stage the crystal faces are found to be pitted by little angular cavities, the faces of which belong to forms in the same series as the crystal, and not only that but the shapes vary on different faces of the crystal and conform in this and in their shape to the symmetry of the class to which the crystal belongs.

Other characters could be instanced, elasticity, heat conductivity, electrical and magnetic characters and so on, but these are discussed more at length in the article "Physical Crystallography." All observations lead to the same conclusions, that most of the physical characters are dependent upon direction and intimately connected with the external form, or a more exact statement is that the physical characters and the external form are both results of the same cause, a "regular internal structure."

The Internal Structure of Crystals. — Although nothing is known about the shapes of the so-called crystal molecules or the forces which arrange these molecules, it is possible to consider from a purely geometric standpoint all regular arrangements of particles in space which are consistent with the law of rational parameters, using as Seeber suggested, the centres of the crystal molecules instead of the molecules themselves.

The so-called "space lattices" of Bravais, for instance, consist of points arranged in sets of parallel straight lines. In each set the points are equidistant and together they make a net-like structure in which the particles are at the corners of equal parallelopipeda. Such a structure is in conformity with the observed "directional regularity," for a line through *any* two points passes through equidistant successive points and along any parallel line through another point the interval between successive points are the same. Bravais distinguished fourteen space lattices according to the symmetry. Each conforms to the symmetry of one of the 32 classes and in each planes through any three points conform to the law of rational parameters.

Sohncke showed that a homogeneous structure still existed if two or more identical space lattices were combined, the one thrust within the other, not coincident with it, but either moved parallel to some axis or rotated 180°, 120°, 90° or 60° around this axis, or with both motions. In this way some 65 different "regular point systems" were obtained, each of which belonged to one of the 32 classes of symmetry.

In the space lattices and regular point systems all the units are orientated in the same way, that is, the corresponding faces of the different units are parallel. Curie, von Federow and Schönfliess independently showed that, corresponding to the frequent occurrences of crystal faces in pairs, like the right and left hand, other arrangements of points could be added which "faced the opposite way," that is, were like the mirror repetitions of the preceding groupings. In this way some 230 "space groups" or types of crystal structure were obtained which each had the symmetry of some one of the 32 crystal classes and which for the first time represented all these crystal classes.

THE RELATION BETWEEN CRYSTAL FORM AND CHEMICAL COMPOSITION.

Polymorphism. — A crystalline structure which conforms to all the known properties of

the crystals of a substance, represents by points the positions of equilibrium about which the movements of the so-called molecules take place. There may, however, be more than one arrangement of points which correspond to positions of equilibrium and it is therefore to be expected that temperature changes will make now one and now another of these the position of most stable equilibrium, and that the substance will therefore assume under different conditions different crystal structures and as a consequence different crystalline form and different physical characters.

This property of "polymorphism" or "physical isomerism" was first observed by Mitscherlich, who found that by slowly cooling fused sulphur monoclinic crystals were developed and that these on standing passed spontaneously, without again being fused, into the usual orthorhombic crystals. Strictly the term is limited to such homogeneous, physically different, conditions of a substance as can be attributed to differences in crystal structure and it must be distinguished from "chemical isomerism," in which the differences between two substances with the same percentage composition, are due either to the different number of atoms or the different linking of the atoms in the chemical molecule.

The distinction between polymorphism and chemical isomerism can sometimes be made by melting or dissolving the substance. In the resultant amorphous condition all differences due strictly to crystal structure disappear and, if the substance is polymorphic, crystals of both modifications should grow further on being placed in contact with the amorphous liquid mass, but when by growth they touch each other one will thereafter grow at the expense of the other. In chemical isomeres, on the contrary, fusion or solution does not destroy the differences and such a solution or fusion in contact with a crystal of each substance will usually grow only its own kind of crystal.

Polymorphism must also be distinguished from "polysymmetry" or the tendency of crystals of a substance of a certain grade of symmetry to unite to apparently simple forms of higher symmetry. For instance, substances which are orthorhombic, monoclinic or triclinic often unite to apparently hexagonal forms, and although twin lamellæ usually reveal the composite structure, at times repeated twinning may yield a structure in no way distinguishable from that of a hexagonal crystal.

In polymorphic substances the transformation from one modification to the other is usually effected by a change of temperature and is accompanied either by release or absorption of heat and the alteration of properties ceases to be a continual function of the temperature. For instance, according to Lehmann, the ordinary orthorhombic crystals of ammonium nitrate melt at about 168° C. If such a melted mass is gradually cooled there form eight-rayed skeleton crystals, isotropic in polarized light, which at 127°, suddenly become doubly refracting, increase in size and become rhombohedra. At 87° acicular orthorhombic crystals develop regularly about the rhombohedral crystals. These phenomena are obtained in reverse order if the cooled mass is reheated gradually.

Other causes than temperature changes, such as the presence of some impurity in a solution, may determine the modification formed; thus, while from a cold solution of pure calcium carbonate hexagonal calcite will separate, Credner has shown that, in the presence of an alkaline silicate, highly modified calcite crystals are deposited, but in the presence of strontium carbonate or lead carbonate only aragonite is deposited.

Morphotropism. — The question of the dependence of the crystal structure on the chemical constitution is of great interest and is studied principally by considering the changes which result in the corresponding structures of different substances of related chemical nature, by the replacement of certain atoms or atomic groups, by others. Interesting comparisons are made by *topical parameters* obtained as follows: The crystal elements α, β, γ, and a, b, c are theoretically the angles and relative lengths of the sides of the elementary parallelopipedon of the crystal structure, but the parameters $a : b : c$ of different crystals can not be used directly for comparison, because in each such proportion one term is unity and the ratio between the unities is not known. To reduce these to the same unit Becke and Muthman assume that the volumes of the elementary parallelopipeds of crystals of different substances are to each other as the quotients of their molecular weights by their specific gravities. The shape of any elementary parallelopipedon is determined by the particular structure and therefore its parameters, the so-called "topical parameters" may be calculated, and, by comparison term by term with the topical parameters of another substance, show the differences in the structure due to the difference in chemical constitution.

By this method it has been proved that the replacement of hydrogen atoms by other atoms results in a regular alteration of crystal form and this phenomenon is called "morphotropism." Some atoms produce a larger alteration in form than others and a given atom produces a change which varies with the original compound, the larger the chemical molecule the less the influence on the form.

Isomorphism.—Certain analogous elements and atomic groups as a rule when replacing each other in a compound do not cause any radical change in the crystalline form. This special type of morphotropism is called "isomorphism" and dates from the discovery of Mitscherlich in 1819 that the phosphates of ammonium and potassium and the arsenates of ammonium and potassium occur in identical crystalline shapes. Such chemical compounds not only crystallize in identical or closely related forms, but can unite in varying proportions to form mixed crystals, each of which is homogeneous, but which vary in the proportion of the component substance and vary proportionally in their physical properties. Such "mixed" crystals are not mechanical mixtures and they differ from double salts in that the latter occur only in one proportion and their physical characters are not functions of their percentage of combination.

Crystal Growth.— Many strange views have been held as to the causes of crystallization, such as "intense cold," "divine fire," "the influence of the stars from which the six-rayed snow crystals come," "the influence of a par-

ticular salt» and «the motions of organic molecules, especially those derived from the remains of animals and plants.» Even now the most definite statements that can safely be made are: that «molecular forces» are the active cause of crystallization, that when a substance solidifies under conditions which permit the free action of these forces the molecules take positions of equilibrium and crystals of some definite symmetry result, and that little is known as to the nature of these molecular forces or their mode of action.

In watching under the microscope the slow evaporation of a solution or the slow cooling of a fusion, an apparent embryonic state has been observed in which the forming solid lacks characteristic shape. Vogelsang and others have observed tiny globules called «globulites,» which according to Vogelsang's theory are liquid spheroids or ellipsoids with a definite internal molecular movement, which renders them capable of mutual attraction. These group themselves in definite forms, sometimes in rows, like strings of beads, «margarites,» and again in needle-like or conical forms, «longulites.» From these develop «crystalloids» of characteristic shape, often doubly refracting, and so on to the complete crystal.

The theory of an embryonic period during which the forming crystal lacks characteristic shape is contradicted by the experiments of Gaubert, who instantly obtained, in certain solutions, very minute, perfectly formed crystals by suddenly diminishing the solubility by the addition of another liquid. Lehmann and others also question the need of a theory of aggregation of globulites by polar attractive forces and consider the necessary motions to be the result of diffusion or concentration currents. For instance, assuming growth to take place only in a supersaturated solution, a crystal introduced in a solution quickly impoverishes the immediate vicinity and growth ceases; but the impoverished liquid, thus becoming lighter, rises and is replaced by a new layer of saturated liquid and thus currents result.

Frequently the growth, as observed on a plate of glass on the microscope stage, is relatively rapid in one direction, suggesting a pointed rod pushing its way rapidly into the richer solution, but thickening slowly, because of the impoverished zone surrounding it. As this zone is gradually enriched by the currents, secondary offshoots form and grow in important crystal directions and these in turn send off tertiary offshoots and so on, the tendency being to the creation of skeleton outlines of crystals. As the concentration of the solution decreases the process becomes slower, the hollow places fill and the complete crystals result.

It is sometimes claimed, as showing an analogy between crystal growth and the growth of an organism, that every species of crystal has a definite limit of growth, and that when this is passed new crystal individuals are formed and the old individual grows no further. Exact measurements show that the large crystals do continue to grow, although with the larger surface the growth is less evident. Moreover, if the cooling or evaporation is made sufficiently slow no new crystals are formed, but all the material deposits on the already formed crystals.

Why a substance should vary in the occurring faces of its crystals is not understood. Rapid formation often results in simple forms and slow formation in complex forms. Foreign material in small amounts, if it crystallize with the substance, may cause the development of unusual faces and the simple presence of large amounts of foreign material may have a similar effect.

In conclusion, it may be said the study of crystals is no longer a simple study of external form, but involves questions of the highest interest to the physicist, chemist and geologist. The purely geometric portion, both as relating to varieties of regular structure and to the laws governing the association of faces in the external form, is well advanced, possibly nearly completed. But many facts remain to be explained as to origin, growth, habit, nature of molecules and molecular forces, and above all, to the relations between chemical constitution and regular structure.

ALFRED J. MOSES,
Professor of Mineralogy, Columbia University.

Crystal Palace, a building at Sydenham, England, about seven miles from London. The material in this building was at one time used in the Crystal Palace erected for the World's Fair which was held at Hyde Park, and was formally opened by Queen Victoria, 25 Feb. 1851. The original building was designed by Sir Joseph Paxton; the materials composing it were glass, iron, and wood. Its area was nearly 21 acres. In 1854, when the building was about to be demolished, a company formed to purchase it, tore down the original and removed the material to Sydenham in Kent, about eight miles from London. The new edifice was patterned after the World's Fair building. The grounds around the present Crystal Palace are in area about 200 acres, and are beautifully laid out. This palace was opened by Queen Victoria, 10 June 1854. The name of Crystal Palace was also given to a large building erected in 1853 in New York. The site was on Sixth Avenue, between 40th and 42d streets. It was a favorite place for large exhibitions, but in 1858 it was destroyed by fire.

Crystallography. *The General Properties of Crystals.*—If we examine a number of crystals (Figs. 19–26) we note the following characteristics. Crystals are solids bounded by flat surfaces called faces, the intersection of two faces is an edge, and the intersection of three or more faces is a quoin. The number of faces, edges, and quoins varies on different crystals but they are always so related that the number of faces plus the number of quoins is equal to the number of edges plus two. The faces not only differ in number but in shape and position. On a given crystal several kinds of faces may occur. The sum of like faces, that is, those of the same shape, on a crystal constitute a form. A form may consist of a single face or of a number of faces up to as high as 48. A crystal may consist of a single form (Figs. 3–10) or of two or more forms, when it is known as a combination (Figs. 19–26). The relative position of crystal faces may be indicated by the interfacial angle between two faces. This interfacial angle is defined by the plane angle formed by a line in each face drawn normal to the intersection-edge at the same point and is meas-

ured by means of a goniometer. Measurement of interfacial angles is the starting point for all determinations and descriptions of crystals. The recurrence of faces and angles is one of the most important properties of crystals. The kind of recurrence varies in different crystals. We also notice that the faces of crystals are arranged in belts of planes called zones with their intersection edges parallel. The faces and angles of crystals do not occur in a haphazard way but they are arranged according to certain definite laws so that on a given crystal for example certain planes may occur as faces while others can not occur. Between the faces, angles, and zones of crystals there exist exact mathematical relations. The importance of crystallography lies in the fact that a given substance (mineral or artificial salt) forms crystals characteristic of that substance and hence the crystal form may often be used in the determination of the substance.

The Symmetry of Crystals.— Symmetry or the recurrence of faces and angles in accordance with fixed laws is one of the most important properties of crystals and deserves detailed study, for it is the property which distinguishes crystals from all other substances and also distinguishes the various kinds of crystals among themselves. The several kinds of recurrence may be defined by the elements of symmetry which are plane, axis, and centre of symmetry. A solid is said to have a plane of symmetry (denoted by P) if it is divided by a plane so that one half of it is a mirror-image of the other half. A solid is said to have an axis of symmetry (A) if about any line the figure may be revolved so that it occupies the same position in space a whole number of times (n) during a complete revolution. The number of times in a revolution defines the axis of symmetry (An). A solid is said to have a centre of symmetry (C) if for every face there is another opposite and parallel to it. Figs 3 to 10 have centres of symmetry, Fig. 25 does not. Geometrical solids made of paper or wood may possess axes of any degree of symmetry, but in crystals all axes of symmetry except those of 2, 3, 4, or 6-fold are inconsistent with the law of rational indices (see later). In crystals only certain combinations of symmetry elements are possible, and there have been deduced mathematically 32 combinations of symmetry elements which characterize the 32 crystals classes. Like the periodic law of chemistry, this law foretold the existence of several crystal classes which were discovered later. To-day there are three combinations to which no known crystals belong. A crystal of a given substance always possesses the symmetry elements characteristic of that substance but no other. In natural crystals it is difficult to determine the symmetry because of distortion of the faces. On account of the vagaries of growth, the size and shape of faces are rarely as represented in ideal drawings or models but it is really the angles that count. Hence the law of constancy of interfacial angles, "in all crystals of the same substance, the angles between corresponding faces are constant." To measure the angles between the faces of the crystals, they intersect the sphere at its centre and radii are drawn normal to the faces of the crystals, they intersect the sphere in points which take the place of the faces and the size and shape of the faces are eliminated. Such a drawing as Fig. 1, known as a stereographic projection shows that the outer distorted crystal has an axis of 6-fold symmetry the same as the inner regular one, for their faces are both projected on the circle at 60° apart.

The Notation of Crystals.— In describing crystals something more than symmetry is

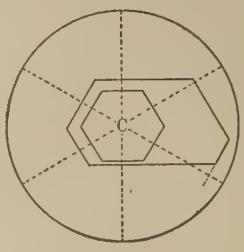

Fig. 1.

needed for there may be differences in crystals with exactly the same symmetry elements (Figs. 6 and 7). Like faces on a crystal constitute a form. There are a number of kinds of forms and they are defined by their shape. A form consisting of a single face is a pedion (plane);

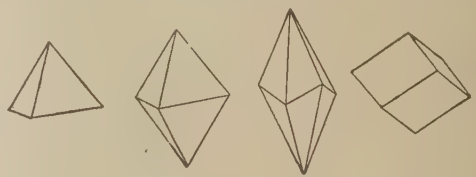

Fig. 2. Fig. 3. Fig. 4. Fig. 5.

two parallel faces, a pinacoid (table); two non-parallel faces astride a plane of symmetry, a dome (house-top); two non-parallel faces not astride a plane of symmetry, sphenoid (wedge). Prisms are forms consisting of three, four, six, eight, or 12 faces in one zone, with an axis of 3, 4, or 6-fold symmetry and are defined ac-

Fig. 6. Fig. 7. Fig. 8. Fig. 9. Fig. 10.

cording to the cross-section as rhombic, trigonal, tetragonal, hexagonal, ditrigonal, ditetragonal, or dihexagonal. Pyramids (Fig. 2) are analogous to and named in the same way as prisms but all the faces intersect in one point; two pyramids placed end to end constitute a bipyramid (Fig. 3), defined in the same way as pyramids. Two sphenoids placed together form a bisphenoid, rhombic or tetragonal according to cross-section. A ditrigonal scalenohedron is composed of 12 scalene triangle faces, six at each end of an axis of 6-fold composite symmetry (Fig. 4), a ditetragonal scalenohedron of eight scalene triangle faces, four at each end of an axis of 4-fold composite symmetry. A rhombohedron (Fig. 5) is composed of six rhomb faces, three at each end of an axis of 6-fold composite symmetry. Trapezohedrons are forms with six, eight, or 12 faces with an axis of 3-fold, 4-fold, or 6-fold symmetry, tri-

gonal, tetragonal, and hexagonal respectively. In the isometric system there are special forms such as cube (6 faces) (Fig. 6); octahedron (8 faces) (Fig. 7); dodecahedron (12 faces) (Fig. 8); trisoctahedron (24 faces) (Fig. 9); trapezohedron (24 faces) (Fig. 10), etc. Some of these, called closed forms, enclose space, hence may occur alone, while others, open forms, can not of themselves enclose space, hence must occur with other forms. Among the closed forms are the bipyramids, bisphenoias, scalenohedrons, rhombohedrons, trapezohedrons, and the special isometric forms; all others are open forms. In order to make use of the mathematical relations of crystals the faces are defined in position by the method of analytic geometry which consists in referring all faces of a crystal to three straight lines passing through the centre of the crystal. These three lines are called axes of reference or crystallographic axes, or simply axes. The selection of these axes is arbitrary but they are always chosen so as to yield the simplest relations possible. They are therefore lines parallel to prominent edges which are usually axes of symmetry or lines normal to planes of symmetry. In Fig. 17 let OX, OY, and OZ be the three axes intersecting in O; any plane ABC is defined by its intercepts, OA, OB, and OC on these three axes, HKL is defined by its intercepts OH, OK, and OL. Now the ratios OA:OH, OB: OK, OC:OL may be expressed in simple numbers, 1, 2, 3, 4, etc., while

FIG. 11.

FIG. 12.

FIG. 13.

the ratios OA : OB : OC and OH : OK : OL are complex. So instead of the absolute values of the intercepts use is made of relative values in terms of a unit plane which intercepts the axes at assumed unit lengths. Thus if ABC is the assumed unit plane, OA = a, OB = b, OC = c, are the unit lengths of the axes. Then another plane HKL may be expressed as

$$\frac{a}{OH} : \frac{b}{OK} : \frac{c}{OL} = h : k : l,$$

in which *h, k, l,* are simple rational numbers such as 1, 2, 3, 4, rarely above 6. The simplest whole numbers which express the ration *h, k, l* are called the Miller indices of the face and are always written in the invariable order, *h* index on *a, k* index on *b,* and *l* index on *c.* A negative index is written $\bar{h}$. The expression *hkl* or (*hkl*) is called the symbol of the face, while [*hkl*] is the symbol of the form of which hkl is the face. Thus there are eight planes which cut the axes at the same relative distances as HKL but on different sides of the origin O. They are *hkl, $\bar{h}$kl, h$\bar{k}$l, hk$\bar{l}$, $\bar{h}\bar{k}$l, $\bar{h}$k$\bar{l}$, h$\bar{k}\bar{l}$, $\bar{h}\bar{k}\bar{l}$.* Together they constitute the form (*hkl*), which is a rhombic bipyramid. Besides (*hkl*), which cuts all three axes, there are other faces which are parallel to some of the axes. Thus we have (Fig. 17) *okl, hol,* and *hko,* each of which cuts two of the axes but are parallel to the other axis, the o in the symbol standing for parallelism and also 001, 010, and 100 which each cut one axis and are parallel to two. These constitute the seven type symbols, hkl, *okl, hol, hko,* 001, 010, 100. In order to determine the type symbol it is only necessary to select the axes and write the indices in the order *h, k, l,* substituting a o when the face is parallel to an axis. The indices of crystal faces are usually simple numbers such as 110, 120, 011, 012, 101, 201, 111, 221, 321, etc. To determine the indices requires calculation (see

FIG. 14.

FIG. 15.

FIG. 16.

Calculation of Crystals). In order to have the indices as simple as possible it has been found necessary to have six kinds of axes of reference, to one of which every crystal must be referred and crystals of one substance are always referred to the same kind of axes of reference. The most general case is (1) three non-equivalent axes at oblique angles to each other (Fig. 11). Then we have (2) three non-equivalent axes, two of which are at oblique angles, the third at right angles to the other two (Fig. 12). (3) Three non-equivalent axes at right angles (Fig. 13). (4) Three axes at right angles, two of which are equivalent (Fig 14). (5) Three equivalent axes at right angles (Fig. 15). With some crystals we make use of (6) four axes, three equivalent ones in one plane at 60° to each other, perpendicular to the fourth one (Fig. 16). In the latter case the symbol is made up of four indices as 10$\bar{1}$0, *ho$\bar{h}$l, hk$\bar{i}$l,* etc.

The Structure of Crystals.— It is the general belief that matter is coarse-grained, not continuous. The law of rational indices is accepted

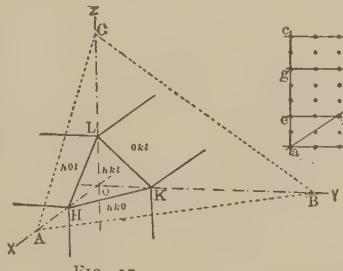

FIG. 17.

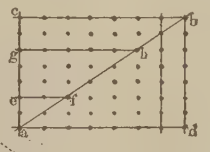

FIG. 18.

as proof of some kind of molecular structure and indeed Haüy's conceptions of crystal structure probably led to his discovery of the law. In physical crystallography (q.v.) we learn that the physical properties are alike in parallel directions, which leads to the conclusion that the grouping of the molecules around each molecule is the same. So the only possible form of structure is a network or space-lattice. The varieties of space-lattices possible in crystals have been deduced mathematically by Sohncke, Schönflies, Barlow and others with the

conclusion that 230 types are possible. While we know little or nothing as to the nature of molecules we do know something as to their arrangement. If we assume a molecular network in crystals it is possible to explain symmetry, constancy of interfacial angles, rationality of indices, differences of habit, cleavage and many physical properties. Thus in a network like every crystal belongs and no crystal belongs to more than one class. The form with the largest number of faces consistent with the symmetry of the class is the *general form* of the class and has the symbol (*hkl*). The class takes its name from the general form. The following table gives the name of the class which also includes the name of the general form and

Triclinic.	1	Triclinic pediad	1	.....	$CaS_2O_3.6H_2O$
	2	Triclinic pinacoidal	2	C	Axinite

Fig. 18 the symmetry is apparent, (2) it is easy to see why the crystals *ghb* and *efb* have their angles *ghb* and *efh* equal, (3) all the planes that pass through the points must have rational indices, (4) a given substance may crystallize in forms like *abc* or *adbc* under different conditions for the structure is the same in each, (5) cleavage may take place in directions like *bd* more easily than in others for the distances between parallel planes are greater in these directions than in others, (6) we also see that cleavage takes place parallel to crystal faces or possible crystal faces, (7) the fact that the physical properties are alike in parallel directions is explained.

The Classes and Systems of Crystals.— Under symmetry of crystals it was found that only 32 combinations of symmetry elements are possible in crystals. These constitute the so-called *crystal classes,* to one of which the system, the number of faces in the general form, the elements of symmetry, and a typical representative of the class, a mineral if one belongs to the class.

For convenience certain classes are grouped together according to the kinds of axes of reference which give the simplest relations. These groups are called systems, the seven systems being the triclinic, monoclinic, orthorhombic, tetragonal, isometric, hexagonal, and trigonal, corresponding respectively to the kinds of axes of reference previously given. The hexagonal and trigonal systems have the same axes of reference. By some authors they are included in one system, the hexagonal. The grouping of the classes into systems is shown in the table. The classes of a system usually have several things in common (1) similarity of symmetry elements (thus all the classes of the hexagonal system have one axis of 6-fold symmetry), (2)

some of the forms are identical, for example the cube and dodecahedron are common to each of the five classes of the isometric system, (3) the combination of certain forms of a class give rise to a form of a more symmetrical class of the same system (thus two tetrahedra (111) and (1$\bar{1}$1) of class 31 together form an octahedron of class 32). So that it is not always possible to determine the class to which a given crystal belongs. Of the 32 classes, the nine most important ones are described in detail.

Triclinic Pinacoidal Class, C.— Crystals are referred to three non-equivalent axes at oblique angles to each other (Fig. 31). The selection of the axes is arbitrary, but they are usually taken parallel to prominent edges. The axial elements are a:b:c and the axial angles α ($b \wedge c$), β ($a \wedge c$) γ ($a \wedge b$). The mathematical relations in the triclinic system are complicated. All forms, whatever the symbol, are pinacoids composed of two parallel faces. The type forms are (*hkl*), (*hkl*), (*hkl*), (*hko*), (*hko*), (*hol*), (*hol*), (*okl*), (*okl*), (001), (010), and (100). The plagioclases (albite, oligoclase, etc.), rhodonite, cyanite, axinite, chalcanthite, and other minerals, belong to this class.

Monoclinic prism	4 hkl

Monoclinic prism	4 okl
Pinacoid	2 hol
Pinacoid	2 001
Pinacoid	2 010
Pinacoid	2 100

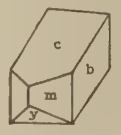

FIG. 19.

Monoclinic Prismatic Class, A_2P.C.— Crystals are referred to three non-equivalent axes, two of which are at oblique angles, the third perpendicular to the plane of the other two. The axial elements are *a*:*b*:*c*, and axial angle β ($a \wedge c$). The axis of symmetry is the b-axis the selection of the other axes is arbitrary but they must be in the plane of symmetry.

Orthoclase, pyroxene, amphibole, monazite, borax, gypsum, and many other minerals belong to this class. Fig. 19 represents an orthoclase crystal with *b*(010), *c*(001), *m*(110), and *y*(201).

Orthorhombic Bipyramidal Class. $3A_2.3P.C.$ — Crystals are referred to three non-equivalent axes at right angles to each other (Fig. 20). The axial ratio is *a*:*b*:*c*. The axes of symmetry are the axes of reference.

Rhombic bipyramid	8 hkl
Rhombic prism	4 hko
Rhombic prism	4 hol
Rhombic prism	4 okl

Pinacoid	2 010
Pinacoid	2 100

FIG. 20.

Sulphur, marcasite, aragonite, topaz, niter, barite, anglesite, and many other minerals belong to this class. Fig. 20 represents a topaz crystal with *m*(110), *l*(120), *c*(001), *u*(111), *i*(223), and *y*(041).

Ditetragonal Bipyramidal Class $4A_2.A_4.5P.C.$ — All crystals are referred to three axes at right angles to each other, two of which are equivalent. The 4-fold axis is the *c*-axis. The axial ratio is a:c.

Rutile, wernerite, vesuvianite, zircon, apophyllite, and a few other minerals belong to this class. Fig. 21 represents a vesuvianite crystal with *a*(100), *m*(110), and *p*(111).

Ditrigonal Scalenohedral Class. $3A_2.A_3.3P.C.$ — All crystals are referred to four axes of reference, three equivalent ones of which are in one plane at 60° to each other and a fourth one normal to these (Fig. 16). The axis of 3-fold symmetry is the *c*-axis. The axial ratio is *a*:*c*.

Ditetragonal prism	16 hkl

Pinacoid	2 0001

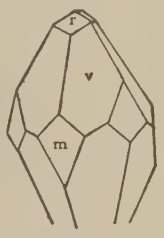

FIG. 22.

Corundum, hematite, calcite, chazabite, soda niter, and a few other minerals belong to this class. Fig. 22 represents a calcite crystal with *v*(21$\bar{3}$1), *r*(10$\bar{1}$1), and *m*(10$\bar{1}$0).

Dihexagonal Bipyramidal Class. $A_6.6A_2.7P.C.$ — All crystals are referred to same axes as in the trigonal system (Fig. 16). The axial ratio is *a*:*c*.

Dihexagonal bipyramid	24 hkīl
Dihexagonal prism	12 hkīo
Hexagonal bipyramid	12 hohl
Hexagonal bipyramid	12 h.h.2h.l
Hexagonal prism	6 10$\bar{1}$0
Hexagonal prism	6 11$\bar{2}$0
Pinacoid	2 0001

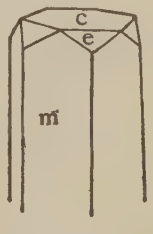

FIG. 23.

Beryl and connellite are the only two minerals that belong to this class. Fig 23 represents a beryl crystal with *c*(0001), *m*(10$\bar{1}$0), and *e*(11$\bar{2}$1).

Isometric Hexoctahedral Class. $6A_2.4A_3.3A_4.9P.C.$ — All crystals are referred to three equivalent axes at right angles to each other (Fig. 15). Forms of this class are the most symmetrical of all crystals, and sometimes approach a spherical form. Galena, halite, fluorite, spinel, magnetite, garnet, and other minerals belong to this class. Fig. 24 represents a crystal of galena with *o*(111) and *p*(221).

Isometric Hextetrahedral Class. $3A_2.4A_3.6P.$ Crystals of this class have a tetrahedrid aspect. Diamond, sphalerite, tetrahedrite, boracite and a few other minerals belong to this class. Fig. 25 represents a crystal of tetrahedrite with *o*(111) and *n*(211).

Isometric Diploidal Class. $3A_2.4A_3.3P.C.$— Pyrite, cobaltite, sperrylite, kalinite, and a few other minerals belong to this class. Fig. 26 rep-

resents a pyrite crystal with $e(210)$, $a(100)$, and $o(111)$.

Aggregates of Crystals.— Crystals are very frequently grouped together and this grouping may be with or without law. Irregular aggregates, where there is a haphazard arrangement of the individual crystals, are perhaps the most frequent. The regular grouping of crystals is one of two kinds. Either the edges and faces are all parallel or a part of them are parallel, that is the parallelism is either complete or partial. Aggregates with partial parallelism are called twins and are usually composed of two individual crystals united in a definite way. One individual appears to have been revolved 180° about a line called the twin-axis and the plane normal to this axis is called the twin-plane. The face of union of the two individuals, which may or may not be the twin-plane, is the composition-face. The twin-plane is a crystal face or a possible crystal face, usually one with simple indices and is never a plane of symmetry. The twin-axis is a crystal edge or is normal to a possible crystal face. The twinning law is defined by the twin-plane or twin-axis. Twins may usually be recognized by the presence of re-entrant angles or by striations, as in the plagioclases. Twins are either contact twins with definite composition-face or penetration-twins with irregular composition-face. In twins

Fig. 24.

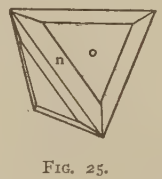

Fig. 25.

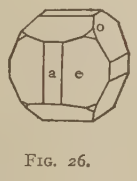

Fig. 26.

the axes of reference are parallel or inclined. Besides simple twins composed of two individuals, twins may consist of several individuals either polysynthetic or cyclic, depending upon the particular faces that serve as twinning-planes. Two or more twinning laws may be exemplified in the same crystal. The tendency of twinning is to raise the grade of symmetry. This is especially prominent in orthorhombic crystals with prism angles of about 60°. In parallel aggregates of the same mineral the individuals are usually of the same habit. But sometimes individuals of different habit are in parallel position as in calcite.

The Habit of Crystals.— Crystals are distinguished in habit as tabular, prismatic, or pyramidal according to the dominant form or prevailing shape. A particular habit often characterizes a certain mineral, for example, barite is usually tabular. Prismatic crystals of barite are so rare that when first found they were described as a new mineral. But a diversity of habit for a mineral is more usual. For example apophyllite occurs tabular, pseudo-cubic, and pyramidal. Octahedrite is either tabular or steep-pyramidal. Crystals from a certain locality may often be recognized as coming from that locality on account of the habit. Evidently a change in conditions causes a change in habit. The presence of a foreign substance is known to modify the crystal habit considerably. Alum, which ordinarily crystallizes in octahedrons, separates from an alkaline solution in cubes. The habit assumed by crystals is often such that the grade of symmetry is lowered or raised. Thus dodecahedrons of garnet according to the particular faces that are developed often simulate tetragonal, orthorhombic, or even monoclinic symmetry. An apparent raise of symmetry is perhaps more common and may result (1) by close approach in angle as in adularia, monoclinic, is often orthorhombic in habit, tetragonal sphenoids of chalcopyrite are usually difficult to distinguish from isometric tetrahedra, and also (2) by twinning as has been stated under crystal aggregates.

The Measurement of Crystals.— The starting point for all exact work in the determination of the indices, axial elements, and system of crystals is the measurement of their angles. There are two kinds of angles that can be measured, interfacial angles as BP and AP in Fig. 27, corresponding to the distance between two places on the earth's surface and coordinate angles ϕ(BCP) and ρ(CP) (Fig. 27), corresponding to the longitude and co-latitude of a place. These angles are measured by instruments called goniometers, which range from the simplest home-made device to an elaborate apparatus costing upward of $200. Interfacial angles are measured by means of one-circle goniometers; co-ordinate angles by means of two-circle goniometers. The one-circle contact or hand-goniometer is a simple apparatus consisting of two pivoted arms which allow

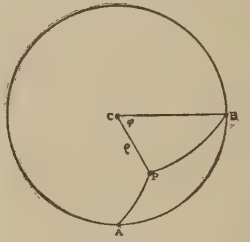

Fig. 27.

easy motion and can be clamped securely. The arms are placed so that each is normal to the intersection edge of the crystal and in close contact with the faces, the interfacial angle of which is to be measured. The arms are then clamped and applied to a graduated semicircular arc. In some cases the arms are permanently attached to the semicircle. These goniometers are usually made of brass, but a simple wooden one may easily be made from two little sticks of wood and a rivet. The hand-goniometer only suffices for fairly large crystals with even faces.

Small crystals with bright faces may be measured very exactly with the reflection goniometer, the invention of Wollaston in 1809. The modern reflection goniometer consists essentially of a graduated circle mounted horizontally on a tripod. Through the centre of the circle is an axis bearing a crystal carrier which is capable of several kinds of adjustments. The crystal is adjusted on carrier until the edge, the interfacial anlge of which is to be measured, coincides with the axis of revolution. A beam of light sent througn the collimator is reflected by one of the crystal faces and an image is seen through the telescope. A reading in this position is taken and then the crystal together with the circle, is revolved until the image from the adjacent face is observed in the telescope, when another reading is made. The difference in the two readings is the supplement of the true interfacial angle, but the supplement angle for various reasons is the one usually recorded and used in calculations. Many precautions are necessary to obtain good readings. The two-circle goniometer is like the one-circle one except that a second circle which bears the crystal carrier is fixed so as to revolve always perpendicular to the horizontal circle. After adjustment of the crystal readings are obtained from each circle for each face. These two angles give the co-ordinate angles ϕ and which can be used in calculation as well as the interfacial angles. The principal advantage of the two-circle goniometer lies in the fact that only one adjustment of the crystal is necessary while with the one-circle goniometer angles are measured in zones and there must be a separate adjustment of the crystal for each zone.

The Calculation of Crystals.— In the case of described crystals it is only necessary to compare the measured with the calculated angles which are on record in the larger works on mineralogy. In the case of new forms or new minerals calculation which involves plane and spherical trigonometry is necessary. The principal steps in the calculation are (1) determination of the indices from the measured angles — in many cases the indices can be accurately determined graphically from a spherical projection (in any crystal determination it is always well to make a stereographic projection for it presents a picture of the mathematical operations involved), (2) calculation of the axial elements from graphically determined indices and measured angles in which proper weight is given to character of faces, etc., (3) calculation of theoretical angles from calculated elements and indices. This is a necessary check on the other work for the proof of the accuracy of the work lies in the closeness of agreement of the observed with the calculated angles. The calculation of crystals is much simplified by zonal relations. If a face is common to two zones its indices may be found without measurement. The indices of each zone written $[uvw]$ must be found by combining the indices of two faces of the zone hkl, and $h'k'l'$ in the following manner: $u = kl' - lk'$, $v = lh' - hl'$; $w = hk' - kh'$; $[u'v'w']$, the symbol of the other zone is also found and (pqr) the desired indices result in a similar manner. If a face (pqr) lies in a zone $[uvw]$ the following is true: $pu + qv + rw = 0$.

The Delineation of Crystals.— Crystal drawings are made for the purpose of furnishing a picture of a crystal to other persons and as an aid in crystal determination. There are two classes of crystal projection (1) those in which the faces are represented by points or lines, their size and shape being eliminated, and (2) those in which the faces are represented in their actual development. In the linear projection (Fig 28) the crystal faces are represented by lines, their intersections are zones. In the stereographic projection (Fig. 29) faces are represented by points, zones, by lines connecting these points, which are arcs of great circles. In the stereographic projection graph-

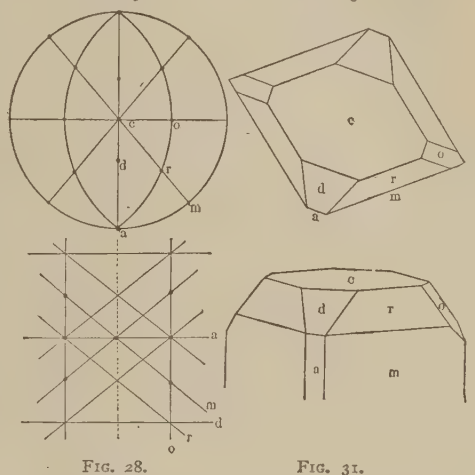

Fig. 29. Fig. 30. Fig. 28. Fig. 31.

ical solutions are easily made and zonal relations are prominently brought out. To the second class of projection belong the orthographic and clinographic projections. In the orthographic projection (Fig. 30), which usually is a basal one, the plane of projection is at right angles to the visual rays. In the clinographic projection (Fig. 31) which is the one ordinarily used in descriptions and in this article the plane of projection is oblique to the visual rays, the point of sight being to the right and above the crystal, which gives the appearance of solidity. A very convenient drawing is a combination of the clinographic projection with an orthographic projection revolved about the vertical axis (Figs. 30 and 31).

Csaba, chŏb'ŏ, Hungary, a market town near White Körös, in the county of Bekes, about 120 miles southeast of Budapest. The trade is chiefly in grain, wine, hemp, flour, and cattle. It has increased greatly in volume of business and population since 1850, when it was a quiet village. Pop. (1900) 37,547.

Csoma de Körös, chō'mŏ dė kė'rish, **Alexander** (Hungarian *Sandor*), Transylvanian traveler and philologist: b. Körös, 4 April 1784;

d. Darjeeling, India, 11 April 1842. He was in early life seized by the desire to investigate the origin of the Magyar race, and after a course of study at Göttingen, he went, in 1820, to the East. He visited Egypt and Persia, and spent several years in a Buddhist monastery in Tibet, diligently studying the Tibetan language and literature; imagining he recognized resemblances between the Tibetan and Magyar. He next lived some years in Calcutta, where he compiled his 'Dictionary of Tibetan and English,' and a 'Grammar of Tibetan.'

Csongrad, chŏn'grăd, Hungary, a market town, capital of a county of the same name, at the junction of the Körös with the Theiss, 72 miles southeast of Budapest. The surrounding country is very flat, and has excellent pastures. Pop. (1900) 22,619.

Ctenoid, tĕn-oid (Gr. "comb-like"), applied to the scales of fishes when jagged or pectinated on the edge like the teeth of a comb, as in the perch, flounder, and turbot.

Ctenophora, tē-nŏf'ō-ra (Gr. "comb-bearing"), a division of the sub-kingdom *Cœlenterata,* comprising free-swimming marine animals, usually glassy, and transparent, which move by means of ciliated comb-like plates. The typical form is pear-shaped or ovoid, but aberrant types, such as the ribbon-shaped Venus' Girdle, are also included in this group. All the species are hermaphrodite. They are carnivorous, and are themselves preyed upon by jelly fishes and sea-anemones. The group comprises two orders, *Tentaculata,* or those with tentacles, and *Nontentaculata,* or those, forming the family *Beroïdæ,* without tentacles.

Ctesias, tē'shĭ-as, Greek historian: fl. about 400 B.C. His writings are particularly valued for the light they throw on the history of eastern nations. He was a physician and lived for 17 years at the court of Persia, and wrote his 'History of Persia' with the view of correcting the errors prevalent among his countrymen about that country. According to Diodorus his work is derived from the official history of the Persians, written according to the law of the country. This work was written in the Ionic dialect, and contained 23 books. Of this work all that remains is an abridgment in Photius and the fragments contained in Diodorus and other historians. An edition of Ctesias, with an introductory essay on his life and writings, was published by Bähr (1824). Consult Gilmore's edition of the fragments of the 'Persika,' with notes and introduction (1889).

Ctesibius, tē-sĭb'ĭ-us, Greek mechanician. He flourished under Ptolemy Philadelphus and Euergetes, at Alexandria, about 250 B.C., and was famous for his inventions in mechanics. We owe to him and his pupil, Hero Alexandrinus, the pump, the bent siphon, and also the discovery of the elastic force of air and its application as a motive power.

Ctesiphon, tĕs'ĭ-fŏn, or **Tak-i-Kesra,** Asia, a city of Babylonia, on the east bank of the Tigris and opposite Seleucia, the common winter residence of the Parthian kings, and finally the capital of the Parthian kingdom. It was conquered by the Romans in 115 A.D., and destroyed by the Arabs under Omar in 637. Its ruins still attest its former magnificence. The two places Ctesiphon and Seleucia are known as the Arab town, El-Modein.

Cuajiniquilapa, kwä-hē-nē-kē'lä-pä, Guatemala, the chief town of the eastern department of Santa Rosa. Its altitude above the level of the sea is 3,254 feet. Pop. 3,062.

Cuautla Morelos, kwä-oot'la dā mō-rā'lōs, Mexico, the chief town of the district of Morelos, in the state of Morelos. It is about 26 miles from Cuernavaca, the capital of the state, and 85½ miles from the city of Mexico, with which it is connected by railway. The surrounding country is a fertile sugar-producing district. Cuautla is historically interesting because it occupies the site of an old Indian town; and furthermore, in the war of independence, the famous patriot leader, José Maria Morelos y Pavón, was besieged here. Pop. about 14,000.

Cuba, an island of the West Indies, separated from the United States by the Strait of Florida, and from Mexico by the Yucatan Channel, and commanding the only entrances into the Gulf of Mexico. Extending east and west from the 74th to the 85th meridian, it constitutes the most important part of the northern barrier of the Caribbean Sea, and guards the Windward Passage, the natural route for commerce between the Atlantic Ocean and the "American Mediterranean," which is equivalent to saying, if we take the larger view, that it guards the route of commerce between the Atlantic and Pacific Oceans, via the Isthmus of Panama. Its eastern point, Cape Maisi, lies directly south of New York city; its western point, Cape St. Antonio, nearly south of Cincinnati. But the total length of the island, 730 miles, is somewhat greater than that statement would indicate, for Cuba curves "like a bird's tongue," as the Spaniards used to say, from lat. 19° 40′ N. in the province of Santiago up to lat. 23° 33′ N., the most northerly provinces being those of Matanzas and Havana. In its upward curve the coast-line attains to a point that is only 96½ miles distant from Key West; thence it falls away again until but 130 miles separate it from the mainland of Mexico. Its width decreases gradually from 100 miles in the east to less than 25 near the line between the two western provinces, Pinar del Rio and Havana. Its total area, including the Isle of Pines and the *cayos* or keys (more than 1,000 islets that form an irregular border along both the northern and southern coasts) is estimated at 44,000 square miles. Thus it is larger than Virginia; smaller than Pennsylvania. Nature has provided unusual facilities for making the most of Cuba's favorable situation upon a great and permanent marine highway. The coast-line is 2,000 miles long, or much more than that if we take into account all its indentations. Capacious harbors, quite evenly distributed along the north coast, are those of Baracoa, Nipe, Gibara, Neuvitas, Sagua la Grande, Matanzas, Havana, Cabanas, and Bahia Honda; and, on the south coast, Cienfuegos, Trinidad, Manzanillo, Santiago de Cuba, and Guantanamo. Besides these there are scores of fairly safe roadsteads and harbors of moderate size. Therefore no plantation on the narrow island can be very far away from some port at which supplies may be received and from which produce may be shipped. The mountains of Cuba occur in three distinct groups. Beginning in the westernmost province,

Pinar del Rio, we find the Guaniguanico range (Sierra de los Organos; greatest altitude, 2,532 feet), extending from Cape San Antonio to the boundary-line of Havana province, and thence continued in lower disconnected hills which give a bold outline to the northern coast of the four central provinces, and become the chief feature of the impressive landscapes around Sagua de Tanamo and Baracoa, far away in the east. The Guamuhaya group occupies but a limited area in the southern part of Santa Clara province, between the cities of Cienfuegos and Trinidad. Its highest summit, El Poterillo, is 2,900 feet. While the foregoing are of no great height, but owe their attractiveness rather to beauty or oddity of outline, the luxuriance of the foliage on their slopes, and the exquisite charm of the valleys they enclose, we find on the southern coast of Santiago province a range that, in sheer majesty, certainly rivals and probably surpasses any mountains of the North American continent, east of the Mississippi — the Sierra Maestra, including the Sierra del Cobre and the Macaca group. Rising precipitously above the Caribbean Sea, this cyclopean wall extends through two degrees of longitude, from Cape Cruz to the city of Santiago, in a nearly straight east and west line. The altitudes of three widely separated peaks are given as follows: The Cerro del Oro, 3,300 feet; La Gran Piedra, 5,200 feet; the Pico Turquino, 8,600 feet. From this it will be seen that all the northern parts of the island, and the southern coast as far west as Cape Cruz, are either mountainous or at least well above sea-level. But a long stretch of coast on the Caribbean Sea, especially the southern portions of Santa Clara and Matanzas provinces, is comparatively low-lying and swampy. The great Zapata swamp is formed where the gradual southern slope reaches the Caribbean level. Beyond the limits of the Zapata is an archipelago of islets, the so-called «Gardens» or «Little Gardens» (Jardinillos), crowding the shallow waters between Cuba and the Isle of Pines.

As we study the geology of these mountain groups we come upon the secret of Cuba's natural wealth — the fertility and depth of the soil that covers the pre-Tertiary sedimentary rocks forming the base of the island's structure. Above the diorites, basalts, and serpentines, the granitoid rocks, the primary and secondary sandstones, limestones, and conglomerates, is a great sheet of late Tertiary limestone. This white sheet or crust, of remarkable thickness, was formed as a deposit of «organically derived oceanic material,» says Dr. Robert T. Hill; and the same authority adds: «The island was reclaimed from the sea by a great mountain-making movement in late Tertiary time, succeeding the deposition of these limestones. In later epochs, Pliocene and Pleistocene, the island underwent a series of epeirogenic subsidences and elevations which affected the coastal borders, producing the wave-cut cliffs and a margin of elevated reef rock which borders the coast in many places.» About two thirds of the entire area of Cuba is covered with soils derived from this organic limestone — soils whose colors, red and black, are not at all suggestive of their origin. In quality, in depth, and in the proportion they sustain to less productive districts of the island, these calcareous soils are probably unrivaled in the world. It is quite certain that they have no rival in any land whose situation is equally favorable for easy and cheap transportation of the produce to foreign markets. A different type of soil, also valuable in agriculture, is the clay and gravel resulting from the decomposition of Tertiary igneous rocks. This occurs in parts of the provinces of Santiago de Cuba, Santa Clara, and Matanzas. Approximately one half of the island has been cleared, but between 13,000,000 and 15,000,000 acres are still covered with forests. The climate also favors vegetation, for the air is moist and injurious extremes of temperature are unknown. At Havana the thermometer averages 77° F. for the year, or 82° F. in the months of July and August, and 72° F. in December and January. At Santiago the average temperature for a year is somewhat higher — about 80° F.; on the other hand, towns located in the interior at an elevation of 200 or 300 feet above sea-level have an agreeable climate, the temperature averaging not more than 74° F. Rain falls most abundantly between the end of April and the beginning of November. The largest river is the Cauto, which flows westward through Santiago province and empties into the Gulf of Guacanayabo. Many smaller streams make their way from the mountains to both the southern and northern coasts; not a few have carved out subterranean passages through the white limestone, and thus, in ages long past, caverns of remarkable beauty have been formed. Even today in the western provinces, a number of streams disappear from view in some underground channel long before the sea is reached. In normal years nearly one half of the entire cane-sugar product of the world comes from Cuban soil, and yet the limit of the island's capacity in this direction has not been reached. As early as the 16th century the sugar industry was established under the special protection of Spanish sovereigns, but after more than 300 years have passed we find, at the beginning of the 20th century, only about 7 per cent of the area of the island devoted to the sugar crop — in other words, about 2,000,000 acres out of the total 28,000,000 acres. During the 17th and 18th centuries the annual output was about 28,000 tons. This increased to 75,000 tons in the first quarter of the 19th century, to 200,000 tons in 1840, and to nearly 300,000 tons in 1850. The increase is significant, for it was directly occasioned by the withdrawal of an annual allowance of $1,000,000 that Spain made to the Cuban administration out of the revenues from Mexico. The loss of Mexico to the Spanish crown closing that source of income, Cuba was thrown upon her own resources, with the result that she turned her attention more earnestly to the development of this profitable form of agriculture. The rapid gain in the amounts produced is shown in the following:

TABLE NO. 1. THE GOLDEN AGE OF CUBA.

Year	Tons	Year	Tons
1853	322,000	1861	466,000
1854	374,000	1862	525,000
1855	392,000	1863	507,000
1856	348,000	1864	575,000
1857	355,000	1865	620,000
1858	385,000	1866	612,000
1859	536,000	1867	597,000
1860	447,000	1868	749,000

TABLE NO. 2. PERIOD OF THE TEN YEARS' WAR.

Year	Tons	Year	Tons
1869	726,000	1871	*547,000
1870	726,000	1872	690,000

*Short crop caused by hurricanes in October, 1870.

Year	Tons	Year	Tons
1873	775,000	1876	590,000
1874	681,000	1877	520,000
1875	718,000	1878	533,000

TABLE NO. 3. FROM TREATY OF ZANJON TO LAST INSURRECTION.

Year	Tons	Year	Tons
1879	670,000	1888	656,719
1880	530,000	1889	560,333
1881	493,000	1890	632,368
1882	595,000	1891	816,980
1883	460,397	1892	976,960
1884	558,939	1893	815,894
1885	631,000	1894	1,054,214
1886	731,723	1895	1,004,264
1887	646,578		

The insurrection beginning in 1895 reduced the crop of the following year to 225,221 tons, and the continuance of hostilities in 1897 and 1898 forced the output of those years down to 212,051 and 300,000 tons. With the restoration of peace in 1898, a new era of development began; and though four years passed before the injuries to mills and fields could be fully repaired, the conditions at the beginning of 1903 justified the hope that the prosperity of the best years before 1896 would be regained.

In the year 1840 the output of beet-sugar for the world was but 50,000 tons, principally grown in France. From that date the production of this competing industry increased so rapidly that in 1894 it was 3,841,000 tons, and naturally this enormous addition to the world's supply caused a reduction in the price of cane-sugar which seemed ruinous, and indeed proved to be ruinous to the planters of many sugar-growing countries. But in Cuba the problem of producing sugar at a profit, despite the constant tendency toward lower prices, has always been solved with brilliant success. It was solved in the great crisis of 1884, and in more recent years whenever it has been presented. In 1902-3 improvements in agricultural methods, in machinery, and in management effected a reduction of the cost of the standard grade on some of the larger estates to much less than two cents a pound. It is evident that such results could not be achieved unless the soil and climate were in the highest degree favorable to the growth of sugar-cane; and what we have stated above is sufficient to show that large districts in which the soil is equally good have never been touched by the plow. Soil and climate are also favorable to the production of the most valuable kind of tobacco. The area in which the characteristic Cuban leaf can be grown is, however, as we shall see, much more restricted. The systematic cultivation of tobacco was not begun in Cuba until 1580, though the discovery of the use of the indigenous plant by the natives of this island dates from the first voyage of Columbus in 1492. Early in the last century the leaf grown in the Vuelta Abajo district (an area of about 90 miles in length by 10 in width, situated in the province of Pinar del Rio) won recognition the world over on account of its excellence; and as the profits of this industry, wherever it could be carried on advantageously, were much greater than those of sugar-making, no effort was spared to extend the area of production into other parts of the island. At least 10,000 tobacco plantations were in operation before the year 1880, but all experiments demonstrated the inferiority of the soil for this use outside of the Vuelta Abajo. Before the revolution of 1895, the production of leaf-tobacco in all the island was about 560,000 bales (averaging 50 kilos each) in a year. Of this amount about 260,000 bales were harvested in Pinar del Rio province, about 70,000 bales in the province of Havana, 130,000 bales in the province of Santa Clara, and 100,000 bales in the province of Santiago de Cuba. Only the 260,000 bales from the Vuelta Abajo were of the finest quality, the other components of the annual crop being known as the Partido leaf, the Remedios leaf, and the Gibara or Mayari — in the main coarser and cheaper grades. The amount of soil available for the production of first-class tobacco being thus limited, the conditions under which it had to be grown were also not at all favorable to either great or cheap production before the year 1903. First-class tobacco lands of the Vuelta Abajo were held at an exceedingly high price, and large rentals were demanded. Irrigation and constant care in most sections were absolutely necessary; efficient labor was scarce, and untrained laborers were not employed lest their blundering should ruin the product of the best fields. The following estimate generalizes the studies of a representative of the Merchants' Association of New York who made his investigations in Cuba during October and November 1902:

ESTIMATE OF COST TO PRODUCE TOBACCO IN PINAR DEL RIO, CUBA.

Lands rent for from $50 to $600 per caballeria (33.17 acres) according to distance from town and fertility of soil.

Average cost per caballeria for raising tobacco from beginning of planting until it is baled ready for market, viz.:		
Preparing land for planting, per caballeria		$ 450.00
Cost of 560 arobas of fertilizer, 7 tons at $60		420.00
Cost of 561,000 tobacco plants, at $2.50 per M.		1,402.50
Labor of planting and distributing fertilizer		165.00
Caring for the plants three months		1,982.00
Cutting and carting to dry house		644.00
Piling the tobacco		40.00
Gathering the seed to produce 1 caballeria		50.00
Depreciation of material and unforeseen expenses		300.00
Expenses for selecting and binding material, and baling, estimating 211 bales per caballeria		1,688.00
Total		$7,141.50
The product is calculated as follows:		
Value of 211 bales, at $50	$10,550	
" " 54 arrobas of seed at $4	216	
" " sticks of tobacco which are sold for fertilizing	12	10,778.00
Profit		$3,636.50

This computation should be regarded as very moderate. One of the leading manufacturers of Havana prepared an estimate for this publication which showed the cost of production in the San Luis district,— perhaps the best part of the Vuelta Abajo,— to be $15,802 for 260 bales of tobacco, the product of one caballeria of land. Avoiding extremes, we may say that the average cost per caballeria in that portion of the island was shown to be between $8,000 and $9,000; and the conclusion is that the production of tobacco in Cuba before 1903 was much more expensive than in any other part of the world. For this reason, and in view of the failure to secure good results outside of a few small districts, it appeared that the tobacco industry was destined, as compared with the cultivation of sugar, to play a secondary role, though still an important one, in the commercial development of Cuba. During seasons of

moderate prosperity it has furnished employment for about 80,000 persons. The value of that part of its product exported to the United States alone, before the insurgents laid waste the Vuelta Abajó and Partido districts, was as follows: In 1888, $7,941,516; in 1889, $9,261,441; in 1890, $11,088,240; in 1891, $10,484,604; in 1892, $10,802,690; in 1893, $11,727,088; in 1894, $7,881,468; in 1895, $9,311,980; in 1896, $12,707,352.

The transfer in 1902–3 of large interests to American capitalists led to the introduction of modern labor-saving devices and economical methods. Formerly growers made the mistake of collecting seeds from inferior third-growth plants, and the result was seen in a gradual degeneration of the plants and diminution of their leaves. To check this degeneration, strong fertilizers had occasionally been used in such large quantities that the leaves, while regaining their lost size, lost much of their fine quality. This was done even after it became a matter of common knowledge that the crops could be improved by scientific selection of seeds. For work in the fields, antiquated wooden plows were still used in 1902; and the tobacco land was cultivated in small farms, an arrangement that seemed necessary to those who employed only the primitive methods of destroying insects and ignored the spraying machine. So long as the old methods prevailed, a native family could not take care of more than a small field; moreover, the labor of the entire family was required, for work went on day and night. Every leaf had to be examined frequently and kept free from tobacco caterpillars. The wife and children aided the adult male laborer, taking turns throughout the 24 hours. In such details as these, improvements were made by the new management, not without opposition. The early attempts to introduce reforms in the established methods of handling the leaf in the manufactories was one cause of the strike of operatives and the riots in Havana (November 1902). Up to the close of the year last mentioned it was supposed that the soil of Pinar del Rio province was unique, both with respect to the rest of Cuba and all other countries as well. But the report of the secretary of agriculture of the United States, published 4 Dec. 1902, contained the announcement that in eastern Texas tobacco had been grown, under the direction of experts of the Department, which could "not be distinguished from the imported Cuban." The Department's representatives made their successful experiments or observations in Texas at Willis, Woodville, Nacogdoches, and Liberty. The area thus roughly defined is larger than all of the tobacco districts of Cuba.

Natural Resources.—In the mountainous eastern province deposits of copper, iron, manganese, and lead exist, and some of the mines have been worked on an extensive scale. The copper mines at Cobre, near the city of Santiago, were opened in 1524, and ranked as the greatest copper mines in the world until the deposits of this metal in the United States were developed. Iron ore of excellent quality outcrops on the southern slope of the Sierra Maestra range, and several companies operate mines east of Santiago which, together, have produced nearly half a million tons of iron in the best years. Deposits of silver have been found in the provinces of Puerto Principe, Santiago, and Santa Clara, and every province contains mines of asphaltum. Cedar, mahogany, pine, lignum-vitæ, ebony, rosewood, logwood, and other dyewoods, are valuable products of the forests for export; for the use of the Cubans themselves the royal palm stands unrivaled. Besides these well-known varieties, there are many less familiar trees — not only the characteristic flora of the other West Indian islands, of Central America, and Florida, but plant-forms that developed quite distinctive characteristics in the depths of these forests whose borders only were touched by the inexpert native lumberman. More than 3,350 native plants were catalogued before an exhaustive study of the subject could be undertaken. All kinds of tropical fruits grow luxuriantly, many of them without cultivation. In point of value the banana heads the list. Cocoanuts, oranges, lemons, limes, and pineapples are grown for shipment in larger or smaller quantities to correspond with the demand in foreign markets, the supply being practically unlimited within a short time after the demand becomes known. The anon, mango, rose-apple, pomegranate, sapote, tamarind, fig, citron, guava, aguacate (alligator pear), mamey, guanabana, etc., are abundant. The cultivation of grapes was forbidden by the Spaniards in the interest of the wine merchants of the Peninsula. No intelligent effort to realize the island's possibilities in this direction has yet been made, though in the year 1893 the value of fruit and vegetables exported to the United States from Cuba was $2,464,191. Coffee culture was at one time a flourishing industry; and since the comparatively small amount still grown in the eastern end of the island is of excellent quality we may expect coffee-raising to prove one of the minor sources of wealth in the future. Cotton grows freely in Cuba. Its cultivation on a commercial scale, abandoned after the liberation of the slaves, was resumed experimentally in the province of Santiago in 1902-3. In all parts of the island grasses grow rankly, and forage is abundant throughout the year. Other conditions favorable to cattle-raising are the mildness of the winters, the streams of fresh water, and the ready access to important markets on the Atlantic coast. Before the insurrection there were two and one half millions of cattle in Cuba; at its conclusion not more than 75,000. The promotion of this industry was encouraged by the Palma administration in 1902–3, and undertaken largely by American capitalists.

Population.—The first census of Cuba was taken in 1774, and we are enabled to trace the growth of population from that date onward. A study of the figures given below shows a decrease of 12.99 per cent in 1819, of 1.47 per cent in 1827, of 10.80 per cent in 1846, and of 1.86 per cent in 1869:

Year.	Pop.	Year.	Pop.
1774	171,620	1841	1,007,625
1787	176,167	1846	898,754
1792	273,939	1855	1,044,185
1804	432,000	1867	1,426,475
1810	600,000	1869	1,399,811
1817	635,604	1874	1,446,372
1819	553,033	1877	1,521,684
1825	715,000	1887	1,631,687
1827	704,487	1903 (est.)	1,590,000
1830	755,695		

As more than 200,000 people were killed or died of starvation and disease during the insurrection of 1895–8, we must assume that the

population increased more rapidly during the eight years before that outbreak than at any other period in the island's history. The natural increment, if we base our calculation upon the United States census rates, excluding the gain through immigration, would have given Cuba a population of considerably more than 5,000,000 in 1903. Destructive wars and oppressive laws account for the difference in part but not wholly. The black or colored element has shown from the first a marked tendency to decline in numbers. Over 1,000,000 African slaves were imported, but the census of 31 Dec. 1887 showed only 528,798 colored persons and 1,102,889 whites, the percentage being 67.59 for whites and 32.41 for colored people, the latter comprising Asiatics as well as negroes. The census of 1877 placed the number of Asiatics at 43,811. We must remember, also, that a large number of the colored people of Cuba, are descendants of the negroes who accompanied the 16th century Spanish explorers and earliest settlers. The Chinese who were brought to the island under contract to work on the sugar plantations have drifted into other occupations, such as market-gardening. The white inhabitants are not all known as Cubans, but are divided into two classes, Cubans and Spaniards — the latter being identified by birth and sympathies with the mother country. In both classes we find some persons of good character and excellent ability. More than elsewhere the custom has been for members of the wealthier families to receive their education abroad; and whereas they were formerly in many instances sent to France, England, or Germany for educational purposes, in recent years, and especially since 1901, the schools of the United States have been almost invariably preferred. The peasants also form a class that deserves a somewhat better reputation than it bears in the world at large. Revolutions and destruction of property were induced by intolerable oppression; it is not true that the natives are more lawless than are the ignorant classes in other countries; and instead of being hopelessly slothful, as travelers have commonly represented them, they are capable of doing fairly good work under proper direction. Between the extremes of wealth and poverty is the class that is most corrupt and least useful; in the structure of Cuban society a student does not find the vigorous and substantial middle class known to Anglo-Saxon and Teutonic communities.

Cities and Towns.— Each of the six provinces has the same name as its capital city. The most populous of the provinces, Havana, with an area of 8,610 square miles and about 436,000 inhabitants, represents the tendency of manufacturing districts to mass their people in a few centres. The city of Havana alone had a population of 235,981 when the government of intervention took its census, and immigration increased that number to more than 247,000 in the next four years. Contrast with this the agricultural province of Pinar del Rio, of which the capital is a town of less than 9,000 inhabitants. Matanzas, capital of the province of that name, is not only important commercially,— its shipments of sugar to the United States having been in value about $60,000,000 in the five years before the late war,— but it is interesting to tourists in search of the picturesque because it adjoins the valley of Yumuri, Cuba's earthly paradise, and the famous caves of Bellamar. Santa Clara (popularly known as Villa Clara), high above sea-level in the centre of its province, is surrounded by a fine grazing country, and both silver and asphaltum are found in its neighborhood. Puerto Principe, a "port" that is 35 miles from the north coast and 45 miles from the south, was the centre of a prosperous grazing district before its cattle were destroyed. Of all the provincial capitals the most famous is that one which the natives call simply "Cuba," and Americans call Santiago — Santiago de Cuba, the second oldest town, formerly the capital of the island, the metropolis of the Roman Catholic Church in Cuba, and the theatre of the main events of the Spanish-American war of 1898. Its safe harbor; its situation, as the natural outlet for the important mining and agricultural industries of the province; even more, its proximity to the Windward Passage, assure the future development of this city. Besides these capitals there are 109 cities and towns in the island that have a population of more than 200: Cienfuegos (see that title), Guanabacoa, Cardenas, Trinidad, Sancti Spiritus (Santo Espiritu), Sagua, Regla, Manzanillo, Guantanamo, ranging from 30,000 to 8,000; and 100 smaller places, some of which are quite important commercially. On the Isle of Pines (area 840 square miles, population about 3,000) there are two small towns, Nueva Gerona and Santa Fé, connected by steamers with Batabano, on the south coast of Havana province. Both lie in an attractive though somewhat inaccessible region, renowned for its excellent climate and products, such as marble and hardwoods. In the past the Isle of Pines was administered as part of the judicial district of Bejucal (province of Havana); but the official declaration of transfer of the government and control of Cuba to the President and Congress of that republic put the ownership of the smaller island in doubt. The following reservation was made: "It is understood by the United States that the present government of the Isle of Pines will continue as a *de facto* government, pending the settlement of the title to said island by treaty pursuant to the Cuban constitution and the act of Congress of the United States approved 2 March 1902." This reservation or condition was accepted by the Cuban president.

History.— A score of years after the discovery, the town of Baracoa was founded by Spaniards under the leadership of Velasquez; next, in rapid succession, came Trinidad, Sancti Spiritus, Puerto Principe, and Santiago, dating from 1514 to 1515. In the year last mentioned Velasquez founded the original town of Havana (San Cristóbal de la Habana) on the south coast; but in 1519 the present site on the north coast was chosen, and to it the settlers of the older town were transferred. So important did this new Havana appear to be that the first governor of Cuba called it "The Key of the New World." Burnt by the buccaneers in 1528, it was rebuilt and surrounded with fortifications by De Soto. Again captured and sacked by pirates in 1556, it was again fortified, and more strongly, by direction of the Spanish crown. Morro Castle was begun before 1600. During the 16th century the value of Cuba in Spanish eyes was precisely what the words "Key of the New World" expressed: at its ports expeditions were fitted out for conquest and exploration of the main-

LAST DAY OF AMERIC

OCCUPATION IN CUBA.

land, but there was no thought of obtaining revenues from the island itself except by the discovery of the precious metals, the futile search for which was never quite abandoned. When the first plants of sugarcane were imported from the Canary Islands to start an industry more remunerative than mining, it became necessary to import slave-labor from Africa also. The Indians had been nearly exterminated — not entirely so, as is commonly asserted, for the aboriginal strain can still be detected in the physiognomy of some Cubans. English, French, and Dutch pirates continued to ravage the coasts during the next century. Cuban cities of that time, with their old-fashioned defensive works, were like the walled towns of mediæval Europe. An attack of the Dutch fleet upon the capital was repulsed in 1628; in 1762, however, a force of English and American colonial troops, under Lord Albemarle, took Havana, which they held until, by the terms of the treaty of Paris of 1763, Spain regained possession. A period of moderate prosperity and exceptionally good government followed. Las Casas, who came out as captain-general in 1790, worked earnestly and wisely to promote Cuba's interests; the Cubans, for their part, evinced their appreciation of such considerate treatment by a chivalrous display in Spain's time of need. Havana learned in 1808 that the Spanish dynasty had been overthrown by Napoleon; thereupon her citizens declared war against Napoleon. And when Spain was losing one after another of her American colonies, Cuba remained loyal. But prosperity,— the brilliant achievements in agriculture to which we have already referred,—brought long years of suffering to the "ever-faithful island" and the mother country as well. The result was inevitable. When the long-sought treasures of Cuba were at last brought forth, not from gold mines but from the fertile soil, Spain sought to make the treasure all her own, as she had monopolized the precious metals three centuries before. With a few noble exceptions, the high Spanish officials sent to Cuba were simply belated *conquistadores,* lacking the personal valor, but possessing the acquisitive talent of the adventurers who first exploited Mexico and Peru. The decree of 1825 placed the lives and fortunes of all Cubans at the disposal of the captains-general. Conspiracies, insurrections, filibustering expeditions from the United States, called forth by oppressive measures, and in turn furnishing a poor justification of repressive measures,— are the main incidents of the story of the 70 years next following. We may mention only the conspiracy of 1829, the rising of the blacks in 1844, the Lopez expeditions in 1849, 1850, and 1851, the revolts in 1855, the Ten Years' war (1868-78) and the revolution of 1895. About 200 Americans took part in the ill-starred expedition of 1851, and of those who surrendered after Lopez's defeat many were shot. Capt.-Gen. Taçon (1836) set native Cubans against resident Spaniards by harsh discrimination, persecuting the former and favoring the latter, thus intensifying that antagonism between the two elements of the white population which to-day makes political controversies rancorous. The cause of the revolutionary movements between 1840 and 1855 was the cruelty of a military commission in 1848, more than 3,000 persons being tortured, imprisoned, banished, or executed at that time for real or supposed complicity in a plot. During a part, at least, of the Ten Years' war, the aim of the Spaniards was, as Capt.-Gen. Valamaseda wrote, to convert the island into a desert. Spain sent 257,000 men against the insurgents and lost 208,000 of them, according to official reports; the Cubans lost 40,000 persons, men, women, and children; the cost of the war, excluding the value of property destroyed, was $300,000,000. Midway in this struggle the Virginius, a vessel whose American register had been fraudulently obtained, was captured by a Spanish warship, taken into the harbor of Santiago, and about 50 of her officers and men were shot without civil trial. The Treaty of Zanjon (1878), while apparently making concessions, restored in effect the old oppressive conditions. The cost of the war was made a new burden for the island to bear, while vexatious restrictions hampered its commercial relations with other countries. "Underground Cuba" gathered force for a final effort; in February 1895, a little flame of insurrection was kindled; in the course of three years the whole island was again laid waste. Throughout the last century the government of the United States manifested an interest in Cuba's fate. In 1823, Mr. Monroe being President, a despatch was sent by the secretary of state to the American minister at Madrid, in which the secretary (Mr. Adams) called particular attention to the commanding position which Cuba occupies with reference to the Gulf of Mexico and the Caribbean Sea, and expressed the opinion that there was no other foreign territory which could compare with it in the sum of the national interests of the United States. In 1825 and 1826 Colombia, being then at war with Spain and designing to invade Cuba and Porto Rico, refrained from this projected attack on the strength of a protest from the United States — a protest in the interests of the slave-power; the new Spanish-American states "always marched under the standard of universal emancipation." Martin Van Buren said in 1829: "It is the interest of the southern section of the Union that no attempt should be made in Cuba to throw off the yoke of Spanish dependence." Webster, in 1848, declared that Cuban emancipation "would strike a death blow at the existence of slavery in the United States." Thus for 20 years the southern slave-owners insisted that the status of Cuba and Porto Rico should not be changed.

The annexation idea came to the front in 1848. A proposition for the purchase of the island was made by President Polk, through his secretary of state, Mr. Buchanan, who wrote to the American minister authorizing the latter to offer $100,000,000 to Spain as compensation for the surrender of a colony which was, as we have seen, a particularly troublesome possession just then. The strategic value of Cuba was dwelt upon in this correspondence, and the fear was expressed that the island might fall into Great Britain's hands, in which event that nation would exercise supreme control over the Gulf of Mexico. The offer was declined by Spain. Both England and France were warned in 1852 that the United States would not admit the claim of any other power to intervene in a dispute of which Cuba was the subject. In February 1854 the cargo of an American steamer, the Black Warrior, was

seized unjustifiably in Havana. It seemed for a time that war, and the acquisition of Cuba by force, might ensue; but reparation was offered by Spain, and was accepted. President Grant intimated in 1875 that "mediation and intervention" might become necessary to put an end to the long struggle then in progress.

The revolution of 1895 falls naturally into three periods: First, that of Capt.-Gen. Martinez Campos, whose fair fighting utterly failed to prevent the spread of the revolutionary movement from the eastern to the western provinces; second, that of Capt.-Gen. Weyler, who inaugurated the shameless policy of reconcentration; third, that of Capt.-Gen. Blanco — including the events from Weyler's recall to the destruction of the Maine. Fighting fairly and like a gentleman, Campos was fairly beaten by men who developed positive genius in guerrilla warfare — Gomez and Antonio Maceo, who knew how to win by skilful evasion, by opportune attack, and, above all, by making an ally of every peasant and living on the country. Maceo crossed both trochas, and reached Pinar del Rio province, thus carrying revolt from one end of the island to the other. Among the hills of the Sierra de los Organos he maintained his band of followers and defied all efforts to dislodge him up to the close of the year 1896. Then he risked his life once too often, and was killed. Campos failing to check the insurrection, Weyler was sent to crush it. The reasoning of the latter was strictly logical. He learned that Cuban peasants supplied the rebels with food, with information in regard to the movements of Spanish columns, and with ammunition — bought, stolen, or brought to the coast by filibusters; he did not shrink, then, from the extreme cruelty involved in the removal of the country folk from their homes to garrisoned cities, where, as "reconcentrados," they should become quite harmless. On 21 Oct. 1896, his infamous proclamation was issued. Thousands of Cuban families were pent in towns or zones under surveillance of a Spanish garrison; and as time went on they died of starvation and fever.

When Spain's prime minister, Señor Cánovas del Castillo, was assassinated, 8 Aug. 1897, the prop of Weyler's Cuban policy was withdrawn. His successor, Gen. Blanco, took to Cuba a policy of compromise. Autonomy was offered; and, for the rescue of the reconcentrados, the suggestion was made that charitable people in the United States might forward supplies to be distributed by the American consuls in Cuba. The proposal of autonomy was rejected with emphasis: Gen. Blanco's emissary who brought the message was shot by an insurgent commander. And when it became known that an appeal for contributions to feed starving Cuba had been made in the United States, formidable riots in Havana expressed resentment of the proffered relief, which was regarded as the entering wedge of the dreaded intervention. For the protection of American interests the Atlantic squadron was ordered to make its headquarters at the Dry Tortugas, within six hours' sail from the Cuban capital; and on 25 January the battleship Maine was sent to Havana harbor. The Spanish government sent the cruiser Vizcaya to New York harbor soon afterward. On 9 Feb. 1898, a letter addressed to Señor Canelejas by Señor Dupuy de Lome, Spanish minister to the United States, was published in the newspapers of the latter country. Its cynical tone and insulting characterization of President McKinley were resented, and Señor de Lome resigned his office. One week later the Maine was destroyed "by the explosion of a submarine mine,"— to quote from the report of the court of inquiry,— "which caused the partial explosion of two or more of her forward magazines." The court was unable to obtain evidence fixing the responsibility upon any person or persons; before the official investigation was made, however, public opinion in the United States had rightly or wrongly assigned the responsibility, and war with Spain seemed inevitable. On 8 March, the House of Representatives passed a bill appropriating $50,000,000 for national defense. Senator Redfield Proctor's statement of his personal observations in Cuba, read to the Senate 17 March, did not make for peace: it confirmed previous reports which had excited pity and indignation. Diplomatic representatives of the six great European powers called at the White House 7 April to present a joint note, a "pressing appeal" for "the maintenance of peace." President McKinley's reply was conciliatory, but the resolve he had formed was expressed in his message of 11 April: "In the name of humanity, in the name of civilization, in behalf of endangered American interests, which give us the right and the duty to speak and act, the war in Cuba must stop." The war in Cuba had, indeed, stopped or halted. The queen regent of Spain had directed Gen. Blanco to proclaim a suspension of hostilities, in order to prepare and facilitate the restoration of peace; and the President's message concluded with the statement that he had received official information of this circumstance. The text of Gen. Blanco's proclamation had been published, and the orders of Gen. Weyler revoked. It was asserted that the reconcentrados were to be permitted to return to their homes, that the sum of $600,000 had been voted for their relief, and that public works had been undertaken for the purpose of giving employment to the poor. Spain had offered to submit to arbitration the disputes which might arise in the matter of the Maine. President McKinley called attention to all these things, and requested that they should be given full weight in the deliberations of Congress. But the "full weight" of such programmes had been ascertained. The reports of American consuls in Cuba accompanying the message described conditions which it seemed impossible to reform without forcible intervention. The famous joint resolutions of 19 April, recognizing "the independence of the people of Cuba, demanding that the government of Spain relinquish its authority and government in the island of Cuba, and withdraw its land and naval forces from Cuba and Cuban waters, and directing the President of the United States to use the land and naval forces of the United States to carry these resolutions into effect," concluded with the words: "The United States hereby disclaims any disposition or intention to exercise sovereignty, jurisdiction, or control over said island, except for the pacification thereof, and asserts its determination when that is accomplished to leave the government and control of the island to its people."

The Spanish-American war began on 21 April 1898; Admiral Cervera's fleet was destroyed off Santiago 3 July; the formal surrender of Santiago took place on 17 July.* See UNITED STATES, SPANISH-AMERICAN WAR. In the protocol suspending hostilities which was signed on 12 Aug. 1898, it was provided that Spain should relinquish all claim of sovereignty over and title to Cuba, and that Cuba should be immediately evacuated. The evacuation proceeded gradually; the last of the Spanish troops leaving 1 Jan. 1899. The participation of the revolutionary army in these events has two noteworthy features: A force of about 3,000 Cubans, led by Gen. Calixto Garcia, joined the American troops at Aserraderos and served through the Santiago campaign, forming a part of the line about the city. Later, the retiring Spanish army was closely followed, outside of the chief cities, by the Cuban army, which took charge of the towns and country, maintaining order and performing police duty; and, when finally disbanded, dispersing peacefully among the people. The treaty of Paris, signed 10 Dec. 1898, provided for the temporary occupation of the island by the United States. By an order dated at Headquarters of the Army, Washington, 13 Dec. 1898, a division known as the Division of Cuba was created, under command of Maj.-Gen. John R. Brooke. The authority of military governor of the island was exercised by Gen. Brooke from 28 Dec. 1898, until 20 Dec. 1899, when he was succeeded by Maj.-Gen. Leonard Wood, who continued in office until 20 May 1902. During the entire period of American occupation (18 July 1898 to 20 May 1902), the total revenues were $57,197,140.80; amount in hands of the treasurer at the close of business, 19 May 1902, $635,170.29. The latter sum was paid to the Republic of Cuba; the former was expended for maintenance of the government ($2,780,781.16), justice and public instruction ($11,108,187.46), sanitation ($9,706,258.20), public buildings, works, ports, and harbors ($5,833,607.90), charities and hospitals ($4,124,986.60), barracks and quarters ($2,525,483.78), etc. A comparatively small amount was used for the pay of officers and men; very large sums devoted to works of public utility, in the interests of the Cuban people. Cuban imports during this period amounted to $225,437,135, the largest items being foodstuffs, animals, and animal products, cotton, silk, vegetable fibres, wool, etc., and metals and metal manufactures. From the United States came 43 per cent of imports, while the rest of the world supplied 57 per cent. Cuban exports amounted to $180,609,067, the United States taking 75 per cent. The articles exported to the United States were tobacco and its manufactures, $45,400,670; sugar and molasses, $77,648,819; wood, unmanufactured, $1,752,451; iron and manganese ore, $2,587,715; fruits and nuts, $2,547,392; all other articles, $5,479,092. Thorough sanitary measures were adopted; the death-rate of the island was lowered; the causes of yellow fever were discovered, and that disease nearly exterminated. Especially successful were the efforts to beautify Havana and improve its sanitary condition; that city became one of the most attractive in Latin America. The reforms extended to the prisons, hospitals, and asylums; a general system of free schools was established throughout the island; in many practical ways Cuba was prepared for self-government.

A constitutional convention, the members of which were elected 15 Sept. 1900, met in the city of Havana the following November. The Constitution of Cuba was adopted 21 Feb. 1901, and an appendix thereto (the "Platt Amendment") 12 June 1901. A form of government was thus provided which, in its main features, resembled that of the United States. The appendix, however, curtails Cuban independence. Its eight articles follow:

I. The Government of Cuba shall never enter into any treaty or other compact with any foreign power or powers which will impair or tend to impair the independence of Cuba, nor in any way authorize or permit any foreign power or powers to obtain by colonization or for naval or military purposes, or otherwise, lodgment or control over any portion of said island.

II. That said Government shall not assume or contract any public debt to pay the interest upon which, and to make reasonable sinking-fund provision for the ultimate discharge of which the ordinary revenues of the Island of Cuba, after defraying the current expenses of the Government, shall be inadequate.

III. That the Government of Cuba consents that the United States may exercise the right to intervene for the preservation of Cuban independence, the maintenance of a government adequate for the protection of life, property, and individual liberty, and for discharging the obligations with respect to Cuba imposed by the Treaty of Paris on the United States, now to be assumed and undertaken by the Government of Cuba.

IV. That all the acts of the United States in Cuba during the military occupancy of said island shall be ratified and held as valid, and all rights legally acquired by virtue of said acts shall be maintained and protected.

V. That the Government of Cuba will execute, and, as far as necessary, extend the plans already devised, or other plans to be mutually agreed upon, for the sanitation of the cities of the island, to the end that a recurrence of epidemic and infectious diseases may be prevented, thereby assuring protection to the people and commerce of Cuba, as well as to the commerce of the Southern ports of the United States and the people residing therein.

VI. The Island of Pines shall be omitted from the boundaries of Cuba specified in the Constitution, the title of ownership thereof being left to future adjustment by treaty.

VII. To enable the United States to maintain the independence of Cuba, and to protect the people thereof, as well as for its own defense, the Cuban Government will sell or lease to the United States the lands necessary for coaling or naval stations, at certain specified points, to be agreed upon with the President of the United States.

VIII. The Government of Cuba will embody the foregoing provisions in a permanent treaty with the United States.

The convention adopted the foregoing articles reluctantly, after considerable delay, and relying upon representations made to certain delegates by President McKinley, Senator Platt, and other officials at Washington, that the tariff on Cuban products sent to the United States would be reduced, as a proper concession in view of the surrender by Cuba of such valuable privileges. The Congress of Cuba (elected 31 Dec. 1901 and 24 Feb. 1902) was convened in Havana 5 May 1902, to examine into the credentials of its own members, and to count and ratify the electoral vote.

At 12 o'clock, noon, 20 May 1902, the Republic of Cuba was established; Tomás Estrada Palma being president, and Luis Estevez Romero vice-president. The transfer was made in the reception hall of the palace of the military governor. A salute of 45 guns was fired while the document of transfer and President Palma's

*For the history of military and naval operations in Cuba and Cuban waters in 1898, see 'UNITED STATES HISTORY,' subdivision, 'The Spanish American War.'

reply were being read; the troops of the Seventh United States Cavalry, formed in the plaza before the palace, presented arms; the band played the American national air, and the American flag was lowered. Next, the Cuban flag was hoisted and greeted with the national salute of 21 guns by the U. S. S. Brooklyn; the Cuban national air was played; the American troops saluted the Cuban flag, and then immediately embarked. There remained on the island, at Santiago, Cienfuegos, and Havana, small forces of artillery, for the preservation and care of the coast defenses, and to avoid leaving the island entirely defenseless against external attack, pending such arrangements for naval stations as were contemplated. Though the failure to secure tariff concessions from the United States as promptly as was expected increased the difficulty of their financial problems, the people of Cuba have a fair record for the first year of the republic's existence. An intelligent effort was made to keep the most important industries moving along in the usual way, and to preserve order throughout the island — the single conspicuous exception being the strike of tobacco workers, which we have mentioned. From the first the balance in the treasury showed a tendency to increase. The completion of the central railway, connecting Santa Clara with Santiago, and the western with the eastern provinces for the first time by a continuous line of railway transportation, gave a new impetus to industrial development in 1903.

Exports from Cuba to the United States in 1905 (fiscal year) were valued at $86,304,259 and the imports of domestic goods from the United States were valued at $36,407,932.

On 2 July, 1903, the coaling-stations and the Isle of Pines treaties were signed at Havana. The former contained the "conditions of the lease of areas of land and water for the establishment of naval or coaling stations in Guantanamo and Bahia Honda," made to the United States in fulfilment of the provisions of article VII of the "Platt Amendment." The treaty relating to the Isle of Pines provided that "The United States of America relinquish in favor of the Republic of Cuba all claim to the title to the island of Pines, . . . in consideration of the concessions of coaling and naval stations which have heretofore been made to the United States of America by the Republic of Cuba."

The famous treaty of commercial reciprocity between Cuba and the United States, having been approved by the Senate of the United States 17 March 1903, and by the Cuban Senate 28 March 1903, was submitted to the House of Representatives at Washington, convened in extraordinary session 9 Nov. 1903. Palma was re-elected in 1905 and re-inaugurated in May 1906 but with his cabinet resigned on 28 Sept. 1906 owing to charges of fraud in the elections of 1905 made by the Liberal Party. The Cuban Congress failed to elect a successor or adjust the differences and Secretary of War Taft proclaimed himself Provincial Governor by authority of President Roosevelt and the United States assumed control of affairs.

Cuba's population, according to the census taken under the direction of the War Department of the United States, was 1,572,797 on 16 Oct. 1899.

MARRION WILCOX.

Cube, in geometry, a solid contained by six equal square sides. The content of a cube is found by multiplying the superficial area of one of the sides by the height; or, in other words, by multiplying the number that expresses the length of one of the edges by itself, and the product thus found by that number again. Cubes are to one another in the triplicate ratio of their diagonals; and a cube is supposed to be generated by the motion of a square plane along a line equal to one of its sides, and at right angles to it; whence it follows that the planes of all sections parallel to the base are squares equal to the base, and consequently to one another.

Cube, or **Cubic Number,** in arithmetic, the result of taking any number thrice as a factor; thus 64 is a cube number, and arises by multiplying 4 by 4 and the result again by 4.

Cubeb, the unripe fruit of *Piper cubeba,* a climbing perennial with smooth stem and alternate lance-shaped, bright green, shining leaves. It is a native of the West Indies, being extensively cultivated in Java and Sumatra. It was introduced into medicine by the Hindus and Arabians, who employed it widely as a condiment also. Cubebs contain about 14 per cent of volatile oil, a small amount of an indifferent substance termed cubebin, and cubebic acid. It also contains a small amount of resin. A mixture of oils, resins, and acids comprises the oleorosin of cubebs that is used in medicine. It is an active spice somewhat related to pepper, its botanical ally, but the taste is more pleasant and less pungent. It is used as a local stimulant in indigestion and as a flavoring vehicle in mixtures and gargles. It is valuable, particularly in diseases of the mucous membrane, especially of the bronchi, of the bladder and of the urethra. Cubebs are very frequently smoked in cigarettes, in which form they have a pleasant stimulating effect on the mucous membrane of the bronchi and larynx.

Cubic Equations, equations in which the highest exponent of a given quantity in any term is 3. Every such equation of one unknown quantity can be reduced to the form $x^3 + px + q = 0$, where x is the variable and p and q are constants. Every equation of this form has three roots, all of which may be real, or one may be real and two imaginary. An equation containing any number of variables in which the greatest sum of the exponents of the variables in any term is 3 is called a cubic equation. Thus $x^2y + 5y^3 + 6 = 0$ and $xyz + z^3 = 0$ are cubic equations in x, y, and x, y, z, respectively.

Cubitt, SIR **William,** English civil engineer: b. Dilham, Norfolk, 1785; d. 13 Oct. 1861. He was a miller, cabinet-maker, and millwright until 1812, when he became chief engineer in Messrs. Ransome's works at Ipswich. In 1823 he joined the Institution of Civil Engineers, and removing to London, was afterward engaged in most of the public undertakings of his day. The improvement of the Severn and of Boulogne port, the Bute docks at Cardiff, and the water-works for Berlin are among his works. He also invented the treadmill, and constructed the Southeastern Railway; and for his services in connection with the erection of the Great Exhibition buildings he was knighted in 1851.

Cucking-stool, a kind of a chair, used anciently in England and Scotland for the punishment of scolds or refractory women, or for dishonest tradesmen. The culprit was placed in the chair, there to be hooted and pelted at by the mob. It was sometimes used as a ducking-stool (q.v.). It was in common use up to the 17th century. Chambers says that one was used at Kingston-on-the-Thames as late as 1745 A.D., and one at Cambridge till 1780. Townsend states that a woman was punished by means of the cucking-stool at the former place in 1801. Many cucking-stools are still in existence. It was called also goging-stool, trebuchet, castigatory, or tumbrel; and the term cucking-stool, the etymology of which had become unintelligible to the common people before the apparatus itself ceased to be used, was corrupted into ducking-stool.

Cuckoo, formerly spelled cuckow, the English name of a common bird, so called from the note of the male, and now generally applied to all related birds of the family *Cuculidæ* (q.v.). The cuckoo of Europe, the *Cuculus canorus* of ornithologists, perhaps occupies more space in general literature than any other bird, on account of the interest which attaches to its remarkable habit of nest parasitism, and the equally remarkable but unfounded superstitions which have collected about what is to many persons, its mysterious life. It is a common summer bird throughout Europe, retiring in winter to equatorial Africa, its southward migration beginning immediately after the close of the breeding season. During April, May, and June the loud "cuck-oo" of the males is one of the most familiar of country sounds; but it wanes with the breeding season. The eggs are invariably laid in the nests of other birds, the hedge sparrow (*Accentor modularis*) and other similar small species being the victims. The female cuckoo is said to deposit her egg on the ground, from which it is then conveyed in the beak to the nest selected, the rightful contents of which are often cast out. A curious circumstance, the reason for which is not fully understood, is that the cuckoo egg usually hatches before any eggs of its hosts which remain in the nest. The young cuckoo secures the exclusive attention of its foster parents by working itself beneath any eggs or other young birds in the nest, raising them on its back, and tumbling them over the edge of the nest.

The true cuckoos are represented in North America by three or four species of the genus *Coccygus,* of which two, the yellow-billed cuckoo (*C. americanus*) and the black-billed cuckoo (*C. erythrophthalmus*) are the best known and most widely distributed, the former ranging, with its western variety, throughout the United States, the West Indies, and much of the British provinces, the latter being chiefly eastern and migrating in winter far into South America. Both species have the bill strongly curved, stout and somewhat flattened at the base, the feet large, with very short metatarsi, the wings long and the tail long and wedge-shaped. Both are of a plain, uniform, bronzy olive-gray above and white, or nearly so, below. They are readily discriminated by the entirely blue-black bill and the absence of bold markings on the tail feathers of the one species, and the partly yellow bill and broad white margins of the tail of the other. In habits the two species differ but little, and except in the manner of deposition of their eggs, not much from the European cuckoo. Both build nests, which are mere loose platforms of twigs placed in thickets and trees, and lay a considerable but variable number of pale green eggs at long and irregular intervals, with the result that the same nest frequently contains freshly deposited eggs along with young birds. Besides the family taint, which the manner of nesting and oviposition suggest, both species occasionally fall into the parasitic habit and place an egg in another bird's nest; not infrequently the yellow-billed species, which is the chief offender, selects her black-billed relative as the recipient of these parental courtesies. In the northern States the cuckoos are late arrivals from the south, not appearing until the fully leaved trees and bushes afford them the concealment which their retiring tastes demand. Their presence is soon known by the oft-repeated loud cow-cow-cow, etc., the frequent utterance of which, upon the approach of storms, has gained for them the name of rain-crow. As destroyers of hairy caterpillars, which most birds pass untouched, the cuckoos deserve the esteem of horticulturists. Though subsisting largely on caterpillars they also eat other insects and occasionally fruits. The ground cuckoo or chaparral cock (q.v.) and the anis or Savannah blackbird (q.v.) are also American. The number of exotic species of cuckoo is very great, and many of them are interesting and handsome birds which are frequently exhibited in zoological gardens. See CUCULIDÆ.

Cuckoo Bee, a commensal (q.v.) of the *Andrena, Halictus,* and other solitary bees, which burrows in the ground. In their slender, smooth, and gaily colored bodies they resemble wasps. The females do not sting severely. Although their eggs are laid in the cells of their hosts, and the larvæ feed upon the pollen stored for the young of their hosts, they are quite different in shape, the head being smaller, and the body more cylindrical. The young as well as the adults of both host and commensal live together harmoniously, the adults of both kinds reaching maturity at the same time. *Nomada imbricata* and *N. pulchella* reside in the nests of *Andrena vicina,* and the former in nests of *Halictus parallelus.* Species of *Stelis* find lodging and board with *Osmia.*

Cuckoo Flies, a species of the hymenopterous family *Chrysididæ,* which, cuckoo-like, live at the expense of various solitary bees and wasps, but, unlike the cuckoo bees (q.v.), actually devour the young of their hosts. They may be seen in hot days briskly flying about and alighting on posts and trees, darting their ovipositor into holes in search of the cells or nests of other *Hymenoptera,* in which to lay their eggs. They feed on the pollen stored up by the host when hatching as maggots. More often they are known to fasten on the back of the larva of their host, suck its blood and thus destroy it; they also appear to destroy the eggs of their host. Although the chrysis lays from 6 to 10 eggs, all but one shrivel up. Chapman has noticed the young larva seize with its mouth-parts a fold of the skin of the helpless larva of the wasp (*Odynerus*) and suck it, without inflicting any visible wound. It spins its cocoon inside that of its host, remaining there until the following spring. The species of

Cleptes is supposed to prey on saw-flies, probably laying their eggs in the cocoons of the latter.

Cuckoo-flower, or **Lady's-smock** (*Cardamine pratensis*), a common and pretty meadow-plant, order *Cruciferæ,* with pale lilac or white flowers. *C. pratensis* is found in swamps and wet meadows from Labrador to northern New Jersey, in Minnesota, and west to the Pacific coast of British America. It is common in England, and throughout northern Europe and Asia. It blossoms in April or May, presenting a very pleasing appearance. It possesses anti-scorbutic properties. The name is also given to the ragged-robin (*Lychnis flos-cuculi*) of the pink family.

Cuckoo-spit, a froth found on plants. It is a secretion of the larvæ of small homopterous insects, of which one of the commonest is the little green *Aphrophora spumaria,* which is very partial to willows. Another closely related green species (*Tettigonia viridis*) is common on meadow plants.

Cucujo, or **Cucuyo,** a luminous beetle of the click-beetle family *Elateridæ,* which, in the West Indies, Mexico, and northern South America, is often used as an ornament in the hair or upon the dress of women. The Indians capture them by waving about in the air a stick to which they have attached a coal, to the light of which the beetles are attracted, when they may be caught in nets. The Indians keep them in cages of wire-netting, feed them each evening upon pieces of crushed sugarcane, and bathe them twice daily in tepid water. In this condition they are offered for sale in large numbers in the shops and street-markets of Vera Cruz and other tropical cities. The principal species (*Pyrophorus noctilucus*) is from one and three quarters to two inches in length, and has no beauty by daylight, being rusty brown or blackish; but when belted and attached to a pin in the hair by a delicate chain it glows at night like an immense gem. See FIREFLY.

Cuculidæ, kū-kū'lĭ-dē, the cuckoo family, the typical one of the order *Coccygomorphæ* (q.v.). The toes are paired, the first and fourth being directed backward, and the second and third forward; the metatarsi are scutellate and the palate is desmognathous; the wings are variable in size and have 10 primary quill feathers; the tail is usually long and wedge-shaped, with 10, or rarely 8, quill feathers. The family is a large one and comprises upward of 40 genera and nearly 200 species, which are especially numerous in Africa and India. Much uncertainty prevails among ornithologists in regard to the number and arrangement of the sub-families. Shelly, in the British Museum Catalogue, recognizes six: *Cuculinæ,* containing the typical tree cuckoos; *Centropodinæ,* semi-terrestrial birds of Africa, India, etc., commonly known as coucals; *Phœnicophaïnæ,* also mostly of semi-terrestrial habits and including the curious genus *Coua,* peculiar to Madagascar, some similar genera of the Indian and Indo-Malayan region, and the so-called rain birds (q.v.) of the West Indies; *Neomorphinæ* or *Saurotherinæ,* the true ground cuckoos, comprising the American chaparral cocks (q.v.), and related East Indian forms; *Diplopterinæ* comprising a few little-known birds of South America, and finally the *Crotophaginæ,* a small group of remarkable typical American cuckoos, represented by the Savannah blackbird (q.v.). Sometimes the American tree cuckoos are separated as a distinct sub-family, the *Coccyginæ.* See CUCKOO; COCCYGOMORPHÆ.

Cucumber (*Cucumis sativus*), an annual trailing or climbing vine of the natural order *Cucurbitaceæ,* cultivated for its unripe fruits which are used as a salad and for making pickles. The plant is a native of southern Asia where it has been cultivated since early historic time, as also in Egypt (Num. xi. 5). The vine is more or less prickly, bears three-lobed or angled leaves which closely resemble those of the muskmelon, and generally spiny fruits which may become smooth as they mature. The fruits are solid, and contain numerous boat-shaped flattened seeds imbedded in a somewhat watery pulp, which in the immature fruits is the part esteemed. Small-fruited varieties and little fruits of large varieties are popularly known as gherkins and are generally preferred for pickles. They are covered with strong brine until needed for use, when, after soaking in pure water to remove the salt, they are put in vinegar, which they soon absorb. There is a great range in size of fruits in the various varieties, some being only about two inches long, and others more than 12 inches by three in diameter. Perhaps the most popular group of varieties is the white spine.

Cucumbers thrive best in warm soils well exposed to the sun. They do not produce well upon heavy clays or very light sands. The land must be well drained, in good tilth, and fairly rich. For earliest crop the seeds are often sown in hotbeds on inverted sods, and the plants set in the field as soon as danger of frost has passed, a sowing of seed being made about the same time to serve as a second crop. Usually only two or three plants are allowed to remain in the hills which are made about four by six feet apart. Since the cucumber-beetle is very actively destructive while the plants are small, six or eight plants should be allowed to remain in the hills until the vines are able to resist attack. Cultivation should be very thorough until the plants begin to run, when it should be confined to the space not occupied by vines. Often, in making the hills, a forkful of well-rotted manure is mixed with the soil to give the plants a little start.

Of the numerous diseases that attack the plants the one usually seen earliest in the season is damping-off (*Pythium debaryanum*), which appears while the seedlings are small. Infested plants quickly become yellow, and wilt and die. It may be prevented by early spraying with a standard fungicide (q.v.) which should be applied to the whole hill and to the under sides of the leaves. Wilt disease caused by *Bacillus tracheiphilus,* is an internal trouble that cannot be combated. The bacteria are spread by insects which inoculate healthy vines by biting or puncturing them. The bacteria multiply in the water-vessels of the vines and impede or stop the flow of water, the leaves wilt and finally shrivel, and the plant dies. It is believed that prevention of the attacks of insects by covering the plants with wire netting until they begin to run will postpone the time of the attack of the bacillus, so that a partial crop may be obtained. Usually the vines die just before the crop is ready to gather, the whole field being

attacked. In greenhouses the most common disease is powdery mildew (*Erysiphe cichoracearum*). It appears as white patches on the leaves which become yellow, brown, then die. Often the whole plant is involved. Evaporated (not burned) sulphur and spraying as above will control this pest.

The most important insect enemies of the cucumber are the cucumber-beetles (*Diabrotica*) and the squash-bug (*Anasa tristis*). The beetles are striped or spotted yellow and black, or green and black, are about a third of an inch long, very active in taking flight, and feed mostly upon the under sides of the leaves and the soft stems of seedlings. The larvæ burrow in the roots, and if numerous, they often kill the plants. During the heat of the day the adults generally hide below the surface of the hill. A liberal use of tobacco-dust upon the hills as soon as the plants peep through the soil is the popular remedy. But since remedies are not entirely satisfactory, the plants are frequently covered with netting until they are about to begin running.

The squash-bug is a dull-gray insect about three quarters of an inch long. It sucks the juices of the plants. There is no known satisfactory remedy for it, but the destruction of the vines as soon as they have fruited, or plowing them under, is helpful toward its extermination. Hand-picking is sometimes resorted to, as is also the destruction of the eggs, which are conspicuously laid on the under sides of the leaves. The cucumber is frequently grown in greenhouses, especially in spring after the main winter crops are out. The plants are started in pots, transplanted to the benches when well established, trained on trellises close to the roof, kept at a rather high temperature, and allowed to suffer no check. The white-spine class is most popular for this purpose in America, but the long English forcing varieties are by many considered superior in quality. Consult: Bailey, 'The Forcing-Book' (1897).

Cucumber Beetle. See MELONS.

Cucumber-tree, a popular name for two trees which bear cucumber-like fruits. One of these is *Averrhoa bilimbi,* known also as blimbing and bilimbi, which belongs to the natural order *Geraniaceæ.* It attains a height of 8 to 15 feet, has pinnate leaves, red flowers in long racemes, and green fruits with acid pulp. It is a native of India and China, is sometimes grown under glass for ornament, and is widely cultivated for food in the warm parts of South America. The other tree is *Magnolia acuminata* of the natural order *Magnoliaceæ.* It is found from New York to Illinois and southward to Arkansas and the Gulf States. It often attains a height of 90 feet, bears oval or oblong leaves, greenish-yellow flowers two or three inches long in late spring, and cylindrical pink, bitter fruits three or four inches long. The timber is useful for boat-building. *M. macrophylla* is often called large-leaved cucumber-tree. It is smaller than the preceding, more spreading, has fragrant flowers, and broader and pinker fruits.

Cucurbitaceæ, the gourd or melon family of plants. They are large herbaceous plants, annual or perennial, with alternate leaves palmately veined and scabrous, and unsexual flowers. The corolla is monopetalous, regular, and with five lobes, often planted longitudinally; and the petals, usually either yellow, white, or green, are deeply veined. The fruit is fleshy and more or less succulent. The general habit is climbing or trailing, by means of tendrils. The order contains at least 90 genera and some 600 species, and abounds in useful or remarkable plants, including the melon, cucumber, colocynth, etc. They are natives of both hemispheres, chiefly within the tropics. The annuals, however, easily submit to the summer of colder climates, and hence are common in northern gardens. Eight genera, comprising about 65 species, are found in America. The principal American genera are *Cucurbita micrampelis, Cyclanthera,* and *Sicyos.*

Cúcuta, koo'koo tä, or **San José de Cúcuta,** Colombia, a city of the department of Santander, near the Venezuelan frontier. It is a place of recent origin which had begun to grow very rapidly when it was destroyed by an earthquake 18 May 1875. Rebuilt soon afterward, it is to-day the handsomest, and commercially the most active town in the department. A railway connects it with the Zulia River, which is navigable by small steamers. Pop. about 20,000.

Cudbear. See ARCHIL.

Cuddapah, kŭd'dą-pä, India, a district and town in the presidency of Madras. The district has an area of 8,722 square miles, and is transversed north to south by the Eastern Ghauts, and watered by the Pennar and its affluents. The heat is intense in April and May. Soda is found in the hills to the southwest, and is used by the natives in place of soap. Salt and saltpetre likewise abound, and are easily procurable. On the plain round Cuddapah hæmatite and fusiform iron ores are found. On the banks of the Pennar, about seven miles northeast of the town of Cuddapah, are diamond mines, which have been worked for several hundred years, and in which gems of considerable value have been found. The mines have not recently proved profitable. Nearly a fifth of the district is under grain cultivation. Cotton is likewise grown. The town lies on a small river of same name, an affluent of the Pennar, 140 miles northwest of Madras. It exports indigo and cotton, and manufactures a kind of coarse cloth. Cuddapah was formerly the capital of an independent state. Pop. 17,200. Pop. of the district 1,354,291.

Cudjo's Cave, an anti-slavery novel by J. T. Trowbridge, published in 1863. The scene of the story is eastern Tennessee, at the outbreak of the Civil War. The State, though seceding, contained many Unionists; and their struggles against the persecution of their Confederate neighbors, slave-holders, and poor whites, form the plot of the book.

Cudlip, Annie Thomas, English novelist: b. Aldborough, Suffolk, 25 Oct. 1838. She is the wife of a clergyman, Rev. Pender Cudlip, and in 1862 began her literary career by publishing 'Sir Victor's Choice.' This was followed by 'Dennis Doune' (1862); 'The Cross of Honor' (1863); and nearly 100 novels. Among the latest of these are 'Comrades True' (1900); 'The Diva' (1901); 'The Cleavers of Cleaver' (1902).

Cudweed, one of the popular names of many small weeds of the genera *Gnaphalium* and *Anaphalis,* of the thistle family. The leaves and stems are covered with a white cottony

down, and the flowers are composed of dry scales, and may be kept for a long time. They are also known as everlasting flowers. The genus *Gnaphalium* has about 120 widely distributed species, and the cudweeds belong properly to this genus alone. *G. polycephalum*, common in old fields and open woods, blossoming in October and November, has some repute in household medicine.

Cudworth, Ralph, English clergyman and philosopher: b. Aller, Somerset, 1617; d. Cambridge 26 June 1688. He was educated at Emmanuel College, Cambridge, and became so eminent as a tutor, that the number of his pupils exceeded all precedent. He was subsequently appointed rector of North Cadbury, Somerset, and in 1642 published a 'Discourse Concerning the True Nature of the Lord's Supper,' and 'The Union of Christ and the Church Shadowed, or in a Shadow.' The first of these productions, which maintained that the Lord's Supper is a feast upon a sacrifice, produced considerable controversy long after the author's death. In 1644 he was chosen master of Clare Hall, and in the following year was made regius professor of Hebrew. In 1654 he was chosen master of Christ's College, Cambridge, where he spent the remainder of his days. In 1678 he published his grand work, entitled 'The True Intellectual System of the Universe, the First Part, Wherein All the Reason and Philosophy of Atheism is Confuted, and Its Impossibility Demonstrated.' It is a work of great power and erudition, although the attachment of the author to the Platonism of the Alexandrian school has led him to advance some opinions which border on incomprehensibility and mysticism.

Cuenca, koo-ĕn'kä, Ecuador, capital of the province of Azuay, and in size the third city of the republic, Quito being first and Guayaquil second. It is situated in the canton of Cuenca, 8,640 feet above the level of the sea; the mean annual temperature is one degree higher than that of the national capital, though it lies 189 miles farther toward the south. As a centre of literary and artistic life, and the birthplace of celebrated authors, it is called «the Athens of Ecuador.» Civil, military, and ecclesiastical authorities are: The governor, town council, bishop, commanding-general of the district, superior court of justice, judge of commerce, and chief of police. Principal institutions, etc.: The town hall, cathedral, seven churches, and several convents, orphan asylum, hospital, prison, library, parks, the university (with faculties of law, medicine, philosophy, and science), lyceum for younger scholars, atheneum, and a school of fine arts, giving instruction in drawing, painting, architecture, music, and the history of the arts. The chief industries of the region are: Agriculture, cattle-raising, (gold) mining, embroidering, and lace-making. Peruvian bark is an important product. Pop. 30,000.

Cuenca (anciently CONCA), Spain, a city in New Castile, capital of a province of same name, 85 miles east-southeast of Madrid; pop. (1887) 9,747. It is a bishop's see, and contains a fine Gothic cathedral. It was built by the Moors, and stands on a high and craggy hill, about 3,400 feet above sea-level, between the rivers Jucar and Huescar, which makes it naturally strong. Here the painter, Salmeron, and the famous Jesuit, Molina, were born. The north and east part of the province is mountainous, and fit only for sheep pasture; the other parts are fertile, producing corn, hemp, fruit, etc. Pop. about 10,000.

Cuenca, Sierra de, a chain of mountains, a section of the Iberian range, which runs through the Spanish province of the same name.

Cuernavaca, kwär-nä-vä'kä, Mexico, the capital city of the state of Morelos and the chief town of the district of Cuernavaca. It is situated on the river Tepeyte, about 46 miles from the city of Mexico. The Palace of Cortés, where the state legislature meets, is one of its noteworthy buildings; also the meteorological observatory and the public library. Both the city and district have a large trade in the products of the region. Pop. of the city 8,747; of the district 40,014. See MORELOS.

Cuervo-Marquez, Luis, loo-ēs kwär'vō mär'kēs, Colombian diplomat and physician: b. Bogota, Colombia, 1864. He was educated in Bogota and Paris, France, graduating from the Escuela de Medicina of Bogota and the Faculté de Médecine of Paris. He has been in the diplomatic service of his country since 1888, serving a part of the time as *charge d'affaires ad interim* in the United States. He has written numerous articles in the literary and professional journals of South America, and published: 'La Fiebre Amarilla' (1891); 'Paludisme' (1893).

Cueva, Juan de la, hoo-än' dā lä kwā'vä, Spanish poet: b. Seville about 1550; d. about 1608. A poet attempting all forms, he excelled most as a dramatist, and is one of the founders of Spanish national drama. In a volume of 'Works' (1582), he published a number of lyric poems, sonnets, songs, and elegies, including the 'Lament of Venus Over Adonis.' His greatest epic is 'The Conquest of Betica' (1603). He wrote four tragedies, one of them on 'The Sack of Rome' by the Constable Bourbon; and 10 comedies, one of the best being 'The Aged Lover.'

Cuffee, Paul, American negro sailor and philanthropist: b. Westport, Mass., 1759; d. 7 Sept. 1818. His father was an African-born Massachusetts slave, who purchased his freedom, bought a farm of 100 acres, and brought up in respectability a family of 10 children; his mother, a Nantucket Indian. At 16 he was a sailor on a whaling vessel, and in 1806 an experienced navigator, owning considerable landed property, houses, stores, a ship, two brigs, and several smaller craft. He built a school-house, hired a teacher, and opened at his own expense the only public school in the neighborhood of his native town. In 1811 he sailed for Sierra Leone in his ship, the Traveler, with a colored crew, won favor there with both whites and blacks, and instituted the Friendly Society of Sierra Leone. In London he was warmly received by Wilberforce and Clarkson, and commissioned by the African Institution to carry goods to Sierra Leone. He died while carrying out his plans for colonizing that country.

Cufic Writing, the written characters of which the Arabians now make use, and with which we meet in printed works, namely, the Neskhi characters, are an invention of the 4th century of the Hegira. Before this time the Cufic characters, so called from the town of Cufa, or Kufa, where they are said to have been in-

vented, were in use. These old characters have so much resemblance to the ancient Syriac writing, the Estrangelo, that it hardly admits of a doubt that the Arabians borrowed them from the inhabitants of Syria. Historical traditions confirm this supposition. The Cufic characters, and perhaps others at an earlier date which essentially resembled them, were probably first introduced among the Arabians a short time before Mohammed. Although we are at present ignorant of the characters which were previously in use among them, and although the imperfect accounts of the Mussulman writers throw very little light upon the subject, yet it is scarcely credible that the Arabians remained destitute of a written character until the 6th century of the Christian era. We find the transition of the Cufic to the Neskhi on the ruins of Chilminar. The influence which the school of Cufa exerted on Islamism caused the use of the character which proceeded from it; and when the others had fallen into oblivion, Cufic writing was the name commonly applied to all kinds of Arabic writing previous to the change made by Ebn Mokla. A knowledge of it is important on account of the many monuments in which it is preserved; especially the coins inscribed with Cufic characters and made in the first centuries of the Hegira.

In connection with these coins are to be considered the small pieces of glass which were introduced, particularly in Sicily, under the dominion of the Mohammedans, instead of money, or perhaps under the sanction of public authority obtained currency as standards of the weight of coins.

Cuir-bouilly, kwēr-boo-lyi, leather softened by boiling, then impressed with ornaments, used for shields, girdles, sword sheaths, coffers, purses, shoes, and many other articles. In the 16th century it was also employed for hangings for rooms gilded and painted, and, when heightened by gold or silver, it was known as cuir doré or cuir argenté.

Cuirass, a breastplate; a covering for the breast; originally, as the name denotes, of leather, also of quilted linen, cloth, etc. The cuirass of plate armor succeeded the hauberk and hacqueton of mail, about the reign of Edward III.; and from that period the surcoat, jupon, etc., which were usually worn over the coat of mail, began to be laid aside. It was again employed by some of Napoleon's regiments, and it is now, in most European services, worn by some regiments of heavy cavalry.

Cuirassier, a cavalryman wearing the cuirass and helmet. The cuirassier represents the horse soldiers of the 16th and 17th centuries, who wore similar armor. The French and German armies have each 12 regiments of cuirassiers, and the Russian army four. Napoleon III.'s bodyguard, called *Les Cent-Gardes,* wore cuirasses of aluminum.

Cuitlalmatzin, or **Citlalmatzin,** Aztec ruler: b. 1470; d. October 1520. He was the younger brother of Montezuma, and after the latter's death, succeeded to the throne, but lived only a few weeks. He was a prisoner in the hands of the Spaniards with his brother, but succeeded in escaping or was released. He organized an active resistance to the invaders and in one of the attacks upon them, Montezuma was killed. The warfare he instituted resulted in the defeat of the Spaniards for the time being, and their retreat to the coast.

Culberson, Charles A., United States senator for Texas: b. Dadeville, Tallapoosa County, Ala., 10 June 1855. In 1856 his parents removed to Texas. Charles A. Culberson was educated at the Virginia Military Institute, Lexington, and graduated in the class of 1874; he prepared for a legal career under his father's tuition, completed his law studies in 1876–7 under Profs. Southall and Minor at the University of Virginia, and was judge of the student law court of the university in 1877; the same year he was the final orator of the Jefferson Literary Society. In 1887 he removed to Dallas, having previously resided at Gilmer and later at Jefferson. In 1890, and again in 1892, he was elected attorney-general of Texas, and in 1894 and in 1896, governor of the State. In 1896 he was appointed chairman of the Texas delegation and delegate at large to the Democratic national convention at Chicago. On 25 Jan. 1899 he succeeded the Hon. Roger Q. Mills as United States senator for Texas.

Culdees, kool'dēz, members of an order of monks or an imitation of such an order, in the British Isles and particularly in Gælic Scotland, of which mention begins to occur in mediæval annals and other writings in the 11th century. The name Culdee, in the Scots Gælic, *Cuilteach,* believed to be equivalent to *gille-Dé* in that dialect and to *ceile-Dé* in the Gælic of Ireland, is by some philologers derived from the Latin *Cultor Dei;* all three words, Scots, Irish, and Latin, meaning servant, or worshipper of God. The Culdees seem to have been immediate successors or continuators of the communities of monks established among the Picts and Scots of North Britain and the Western Isles by Irish missionaries in the 6th century. Like the monks of the Highlands and the Hebrides, the Culdees preserved their clan affiliations and relationships; a community of Culdees — always comprising a few members only — would consist of men all of the same clan and related to each other by kinship. In the course of time the headship or priorate of a community of Culdees, like the headship of a clan, became hereditary, descending from father to son; for these monks, each little priory being autonomous, and not subject to any general superior at Rome or elsewhere, had little respect for their monastic rule or for monastic celibacy; and with the dignity of the prior descended the lordship of the monastic estates. Before they lost entirely the status of a religious order they were in some parts of Scotland recognized as canons regular and as such served cathedral churches. The principal places or convents of the Culdees in their best days were at St. Andrews, Dunkeld, Lochleven, Abernethy, and Brechin.

Culebra (koo-lā'brä) **Island,** subject to the jurisdiction of the government of Porto Rico, and assigned to the department of Humaco, Vieques district. It lies in the passage between Porto Rico and the Virgin group; the name Islas de Pasaje has therefore been given to it and the island of Vieques. Water is supplied by a public cistern. Pop. (1900) 704. See Virgin Islands.

Culiacán Rosales, rō-zäl'ēs, Mexico, capital of the state of Sinaloa, and chief town of the district of Culiacán. It is situated about 887 miles from the city of Mexico, and is an important commercial centre, with fine public buildings, including a cathedral, government palace, and mint. A railroad 37 miles long connects it with the seaport town of Altata. It has cotton-mills and other industrial establishments. Pop. 10,487.

Culicidæ, kū-lĭs'ĭ-dē, a sub-family of dipterous insects of the family *Tipulidæ*. The genus *Culex* comprehends the common gnat and the mosquito (q.v.).

Culil'awan Bark, the aromatic pungent bark of the *Cinnamomum culilawan*, a tree of the Moluccas; useful in indigestion, diarrhœa, etc. Called also clove-bark.

Culin, Stewart, American anthropologist: b. Philadelphia, Pa., 13 July 1858. He is curator of the Museum of Science and Art of the University of Pennsylvania, and one of the foremost anthropologists of America. Besides many minor papers, he has written two very able monographs, 'Korean Games' (1896); and 'Chess and Playing Cards' (in Report of the United States National Museum 1896); also an essay on 'Mancala, the National Game of Africa' (in Report of the United States National Museum 1894).

Culinary. See COOKERY.

Cullen, Paul, Irish Roman Catholic prelate: b. near Ballytore, County Kildare, 27 April 1803; d. Dublin 24 Oct. 1878. He was ordained priest in 1829, and filled in succession the offices of vice-rector and rector of the Irish College in Rome, and rector of the Propaganda College. During the period of Mazzini's power in Rome in 1848, Cullen saved the property of his college by placing it under American protection. At the close of 1849 he unexpectedly found himself nominated to the archbishopric of Armagh and primacy of Ireland. His vigorous denunciations of Fenianism made him many enemies. At the Synod of Thurles in 1851, principally by Cullen's persuasion, the establishment of a Roman Catholic university in Ireland was recommended. Translated to Dublin in 1852, he was created a cardinal priest in 1866, the first Irishman who had reached that rank. One of the majority at the Vatican council, he long enjoyed the familiar friendship of Pope Pius IX.

Cullera, kōl-yā'rä, Spain, a fortified town in the province of Valencia, and 25 miles south by east of Valencia, on the Jucar River. Its natural position makes it a place of military importance, and though its fortifications have been repeatedly dismantled, they are now in an efficient state. Pop. 12,000.

Cullo'den Moor, a heath in Scotland, four miles east of Inverness. It is celebrated for a victory obtained 27 April 1746, by the Duke of Cumberland over Prince Charles Edward Stuart (the Pretender) and his adherents. The battle of Culloden was the last battle fought on British soil, and the termination of the attempts of the Stuart family to recover the throne of England. A monumental cairn and green mounds have been raised where the fiercest of the fight raged, and where many of the slain are buried.

Cullom, Shelby Moore, American senator: b. Wayne County, Ky., 22 Nov. 1829. In 1853 he went to Springfield, Ill., to study law, was admitted to the bar, and settled in practice there. He was in the Illinois House of Representatives 1856, 1860, 1872, 1874, and its speaker in 1861 and 1873. He was elected to Congress 1865–71. At the Republican national convention, 1872, he nominated Gen. U. S. Grant. He was governor of Illinois 1877–83, when he was elected to the United States Senate, and re-elected 1888, 1894, 1900, and 1907. He was chairman of the senate committee which reported the Interstate Commerce Bill, and a member of the commission appointed to prepare a system of laws for the Hawaiian Islands. His report on the regulation of railroad corporations by national legislation, presented to the Senate, 18 Jan. 1886, has taken its place as a permanent contribution to economic literature.

Cullum, George Washington, American military officer: b. New York 25 Feb. 1809; d. there 28 Feb. 1892. He was graduated from West Point in 1833; and was engaged for the next 28 years in engineering labors and in instructing at West Point in practical military engineering. During the Civil War he was chief of staff to the general-in-chief 1861–4, and superintendent of the military academy 1864–6. From that time he was a member of the board of engineers for fortifications, until he was placed on the retired list in 1874. At the time of his retirement he was colonel and brevet major-general in the regular army. Besides numerous military memoirs and reports, he published: 'Military Bridges with India-rubber Pontoons' (1849); 'Register of Officers of the U. S. Military Academy from 1802 to 1850' (1850); a translation of Duparc's 'Elements of Military Art and History,' with notes, etc. (1863); a 'Biographical Register of the Officers and Graduates of the U. S. Military Academy' (1868) (revised edition 1879); 'Campaigns of the War of 1812 Criticised' (1880). He bequeathed $250,000 for the erection of a memorial hall on the grounds of the military academy, and $40,000 for furnishing it with military busts, paintings, and other appropriate objects.

Culm, a term used in the United States to designate waste anthracite coal. At one time disposal of the culm heaps surrounding the shafts of the mines in Pennsylvania, became a serious problem, until its use as fuel was made possible, either by burning it in special grates, or by pressing it into briquettes (q.v.). In England the culm is sometimes made up into balls, with one third of its bulk of wet clay. This mixture burns without flame, and gives a steady heat suitable for cooking. In botany culm is the straw or hollow stem of the grasses.

Culmina'tion, an astronomical term, signifying the passage of a star across the meridian. The star is then at the highest point (*culmen*) of its course; hence the name. The sun culminates at mid-day, or 12 o'clock, apparent solar time — which seldom agrees exactly with mean time, as shown by a watch or clock. The full moon culminates at midnight. The term is interchangeable with transit.

Culpepper, John, English colonial leader in the provinces of North and South Carolina. He was a refugee from the southern or Clarendon colony, and in 1678 was the head of an

insurrection in the northern or Albemarle colony in favor of popular liberty. The insurgents later sent Culpepper to England to negotiate a compromise. He was indicted for high treason, but through the influence of Shaftesbury was acquitted on the ground that no regular government had existed in Albemarle. He returned to Carolina, and in 1680 laid out the city of Charleston, reducing the paths, streets, and squares to comparative regularity, and enclosing the town site with a line of fortifications.

Culpepper, or **Colepeper, Thomas,** American royal governor: b. England; d. there 1719. He was one of King Charles II.'s favorites, who received from that monarch a grant of the entire territory of Virginia for a period of 31 years from 1673, a grant so astounding in character that, in the opinion of at least one historian, nothing but the very deed itself, still extant, could be accepted as evidence of the fact. He was governor of Virginia 1682–3, and two years later relinquished most of his Virginia grant, retaining only a portion called Northern Neck, and securing, instead of the remainder, an annual pension of £600 for 20 years. His whole career was actuated by the meanest rapacity, an example of which may be seen in his trying to swindle the colonists by paying the public wages in light coin, on which he had himself put an arbitrary value. Consult Doyle, 'English Colonies in America,' Vol. I. (1882).

Culprit Fay, The, a poem by Joseph Rodman Drake (q.v.). It relates the love of a fairy for a mortal, and the punishment of the offense.

Cumæ, kū'mē, a very ancient city in Campania, and the oldest colony of the Greeks in Italy, was founded about 1030 B.C. by colonists from Chalcis in Eubœa, and from Cyme (Greek Kumē) in Asia Minor. The common belief of the inhabitants made it the residence of the Cumæn sibyl, though her home was really in Asia, and was no doubt transferred to Italy by the Asiatic colonists. She founded Naples (Neapolis), and in Sicily Zancle or Messina. In 420 B.C. Cumæ was taken by the Campanians, and came with them under the power of Rome (345 B.C.). It was destroyed 1207 A.D.; and all that remains of the city are some ruins of an amphitheatre, of a small temple, and masses of masonry, evidently of Roman construction.

Cumana, koo-mä-nä', Venezuela, capital of the new state of Sucre, which formerly constituted a section of the state of Bermúdez. It was founded by Gonzáles Ocampo in 1520, and is situated on the banks of the Manzanares River, one mile from the southern coast of the Gulf of Cariaco. The city is celebrated as being the first permanent settlement of Europeans on that coast. Being situated on ground of volcanic formation, the city is subject to frequent earthquakes. The surrounding country is fertile, producing especially fine grapes, pineapples, and other fruits, and such tropical plants as coffee and cacao. A railroad connects the city with the gulf; the port has a flourishing foreign commerce. Pop. about 10,000.

Cumarin. See COUMARIN.

Cumberland, Richard, English dramatist and essayist: b. Cambridge 19 Feb. 1732; d. Tunbridge Wells 7 May 1811. His comedies, 'The West Indian'; 'The Wheel of Fortune'; 'The Jew'; and 'The Fashionable Lover,' are an epitome of the culture of the time; as are his essays, collected under the title of 'The Observer.' He wrote novels, tracts, religious, and didactic poems, not now important; 'Anecdotes of Eminent Painters in Spain'; 'Memoirs' (1806).

Cumberland, Md., a city and the county-seat of Allegany County; 150 miles southeast of Pittsburg, Pa., 178 miles northwest of Baltimore, and 152 miles northwest of Washington, D. C. It is picturesquely located on the Potomac River, about 700 feet above tide-water. It is also on the Baltimore & Ohio, the Pennsylvania, and other railways; and on the Chesapeake & Ohio Canal, which extends thence to Georgetown, D. C.

Industries, etc.— Cumberland is situated at the edge of the Chesapeake & Ohio Canal coal region, the carrying of coal being the principal business of that waterway. It is the shipping-point for the large quantities of the semi-bituminous variety mined in that section. Its manufactures also are considerable. They include cement-works, glass-works, brick-works, flour-mills, tanneries, steel-works, iron-foundries, and numerous other enterprises. Here are located further large rolling-mills for the manufacture of rails, bars, and other materials of railway supply, as well as railway car and repair shops. A large capital is invested in the mercantile interests.

History, Government, etc.— Fort Cumberland was built in the winter of the years 1754–5, at the beginning of the French and Indian war. On the site of the fort, Cumberland was laid out in 1785. It was incorporated in 1815, and became a city in 1850. The government of Cumberland is directed by a mayor, who is biennially elected, and a city council, the members of which are chosen in part by wards and to some extent at large. The admirable system of water-works, which is operated on the Holly plan, is owned and managed by the municipality, as is also the electric-light works. The mayor nominates to the various boards of administration, his nominations being subject to the approval of the council. Pop. (1900) 17,128; (1910) 21,839.

Cumberland, R. I., a town in Providence County, a few miles north of the city of Providence, on the New York, New Haven & Hartford Railroad. It has extensive manufactures of cotton goods, and iron wares. Pop. (1900) 8,925.

Cumberland, Army of the, in the American Civil War; a name applied to one of the principal Federal armies, which prior to 30 Oct. 1862, had been known as the Army of the Ohio. On this date Gen. W. S. Rosecrans assumed command and a new army of the Ohio was formed. The Army of the Cumberland continued under the command of Gen. Rosecrans until October 1863, when Gen. George H. Thomas became commander.

Cumberland, Fort, built 1754–5 by Braddock (q.v.) as a basis for his expedition against Fort Duquesne. Cumberland, Md., occupies the site of what was once Fort Cumberland. It was left in command of Col. James Innes, and the remnant of the expedition returned to it. Washington afterward commanded it. The

name was also given by the English in 1755 to Fort Beauséjour in Maine, captured from the French who had built it the year before.

Cumberland, a river which rises in the Cumberland Mountains, Virginia, and runs through Kentucky and Tennessee into the Ohio, 60 miles from the Mississippi, having a course of about 600 miles. It is navigable for steamboats to Nashville, nearly 200 miles, and for boats of 15 tons 300 miles farther. At certain seasons vessels of 400 tons may descend 400 miles to the Ohio.

Cumberland Gap, a passage through the Cumberland Mountains, on the line between Kentucky and Tennessee and at the western extremity of Virginia. It is noted for many incidents connected with the Civil War.

Cumberland Gap, on the dividing line of Virginia and Kentucky on the north, and Tennessee on the south, is the main gateway of the Cumberland Mountains, between eastern Kentucky and East Tennessee. Early in the Civil War it was occupied by the Confederates and remained in their possession until 18 June 1862, when, in view of a concentration of the Confederates at Chattanooga, which was threatened by the advance of Gen. O. M. Mitchell from Huntsville and Bridgeport, Ala., it was evacuated, and was occupied by Gen. Geo. W. Morgan, who, with a division of 8,000 men, had been operating against it for nearly two months. Morgan fortified it, established magazines and an arsenal, from which thousands of arms, with ammunition, were distributed to the Union men of East Tennessee, and remained in possession until 17 Sept. 1862. Then Gen. E. Kirby Smith, having crossed the mountains south and defeated Gen. Nelson at Richmond, Ky. (29 and 30 August), thus cutting off communication from the north, while Gen. C. L. Stevenson with a division of 9,000 men was pressing him in front, Morgan, short of provisions and forage, and not prepared for a siege, blew up his arsenal and magazines, set fire to his storehouses, and at night, 17 September, started on a march of 200 miles through an almost unbroken wilderness to Greenup, on the Ohio river. He reached there 3 October without the loss of a gun or a wagon, and with the loss of only 80 men, although pursued some distance by Stevenson, and harassed much of the way by Morgan's cavalry. Bragg retreated through the Gap, after the failure of his Kentucky campaign, and it remained in Confederate possession a year. Gen. Burnside entered Knoxville 3 Sept. 1863, and finding the Gap occupied by Gen. John W. Frazer, with a brigade of 2,300 men, ordered Gen. Shackleford with a cavalry brigade to approach it from the south and co-operate with Col. De Courcy, who, with a division of new troops, had been ordered to march on it from the north. Shackleford reached the south end of the Gap on the 7th and communicated with De Courcy, who had arrived on the north side, and both summoned Frazer to surrender, who refused. Burnside led an infantry brigade from Knoxville, joined Shackleford on the morning of the 9th and at his demand Frazer surrendered his force of over 2,000 men, with 12 guns and a large supply of ammunition. The Gap remained in Union possession to the close of the War. Consult: 'Official Records,' Vol. XXX.; The Century Company's 'Battles and Leaders of the Civil War,' Vol. III. E. A. CARMAN.

Cumberland Island, now thought to be a peninsula of Baffin Land, extending into Davis Strait.

Cumberland Mountains, that portion of the Appalachian group which ranges along the southwest border of Virginia and the southeast of Kentucky, and passes across the State of Tennessee into the northeastern part of Alabama. It spreads over a width of about 50 miles, parallel ridges alternating with longitudinal valleys. The ridges rarely exceed 2,000 feet high. They are rocky and little cultivated, but the valleys are fertile. These mountains lie west of the range of the granite and metamorphic rocks, which compose the mountains on the western borders of North Carolina and the northern part of Georgia. They are upon the range of the great coal formation of the Middle States, and essentially composed of the same groups of stratified rocks as those of the Alleghany Mountains, Chestnut Ridge, and Laurel Hill in Pennsylvania. The Tennessee River and its branches drain a portion of the eastern slope.

Cumberland Presbyterians. See PRESBYTERIANISM.

Cumberland Road, The, or **Great National Pike,** originally, a road planned from the Maryland frontier at Cumberland, Md., to connect with the State roads and run to St. Louis (then just fallen into United States hands by the Louisiana Purchase); to open up the West to immigrants, and provide for military and postal transportation. It was to be built at national expense from the sales of public lands, as a fair counterpoise to the seaboard States' ability to pay their expenses by levying customs duties; and pushed forward by sections as settlement advanced. Henry Clay was its most conspicuous projector and advocate, and a monument to commemorate his services to it has been erected on its course near Wheeling, W. Va. The bill for the first section passed Congress 29 March 1806; it authorized the President (Jefferson) to appoint three commissioners to lay out the road from Cumberland to the Ohio River (Wheeling), and appropriated $30,000 for expenses. At the same time another was passed to lay out one through Georgia, on the New Orleans route; and others followed in swift succession for two decades. This policy of roads, soon supplemented by canals, became the great battle-ground for the strict-construction party, who fought the whole policy of internal improvements as unconstitutional; and the Cumberland Road with its constant call for improvements and repairs aroused ever fresh resistance. Finally in 1822, Monroe, although he had signed two annual bills of the kind, vetoed a third; and for the time the improvements and new roads came to a standstill. With John Quincy Adams, who was in thorough sympathy with Clay's policy, as with every other to increase the national wealth and power, the system started up afresh; and the Cumberland Road was pushed forward through Ohio and Indiana. On the accession of Jackson, a strict-constructionist, the vetoes began and the roads stopped; with Van Buren the latter commenced again, and by 1840 the road had advanced to Vandalia, Ill. By this time the railroads had become so decisively the coming transportation system that no more was built; the last act in its favor was passed 25

May 1838. It was admirably constructed, macadamized, with stone bridges, and iron mile-posts and toll-gates; and the total amount expended on it by the United States was $6,821,246. The name "Cumberland Road" in current use was extended to take in the section from Cumberland through Frederick to Baltimore, built largely by Maryland banks, which were rechartered in 1816 on condition of completing it. It was a most profitable speculation, the tolls yielding them sometimes as high as 20 per cent, though finally sinking to 2 or 3 per cent. The portion built by the national government was acquired in 1878 by the counties of Alleghany and Garrett, which made it a free road. The whole road from Baltimore to Vandalia is about 800 miles long. Consult: Hulbert, 'The Cumberland Road' (1903); Rideing, 'The Old National Pike' ('Harper's Magazine,' Vol. LIX., 1879).

Cumberland University, located at Lebanon, Tenn. The history of higher education in the Cumberland Presbyterian Church begins with the year 1826, when Cumberland College was established at Princeton, Ky. From the beginning the college was seriously embarrassed by a small debt and a too meager income; and so year by year the situation grew worse, as the burden resting on the General Assembly grew heavier. Finally, in 1842, after fruitless efforts to lift the debt and endow the college, the General Assembly "appointed a committee to select a suitable location for the establishment of a new institution." After investigation the committee decided on Lebanon, Tenn. For a few years it was called Cumberland College, but in 1844 the name was changed to Cumberland University. The University was first chartered 30 Dec. 1843, which charter has been several times amended. The board of trustees is local and self-perpetuating. The election of new members, however, must be confirmed by the General Assembly of the Cumberland Presbyterian Church. The Law School was opened in 1847. Its growth from the beginning was remarkable, and in 1856 it was considered the second in size among the law schools in the country. By the concurrent action of the General Assembly and the board of trustees the Theological School was established in 1852. The School of Engineering was also established in 1852. When the Civil War began, the value of buildings and apparatus belonging to the University was very creditable. Moreover the University was in a very prosperous condition, the number of students in 1858 — the most successful year before the war — being 481. During the war the University suffered a fate like that of many other Southern schools. The buildings were burned, apparatus and library destroyed, the endowment was rendered worthless, and many of the trustees and friends lost all hope of reorganization. Notwithstanding all this, a few faithful ones determined to attempt the seemingly impossible, and in January, 1866, the University was reopened without buildings, endowment or apparatus. Since the "resurgence from ashes" the University has had a steady growth. Its buildings are new, large and commodious, its libraries, general and departmental, number more than 20,000 volumes; its apparatus is valued at many thousand dollars, and its influence reaches far and wide through the Union.

The University has had five presidents all of whom have done noble work. In 1902 David E. Mitchell was elected to the presidency of the institution. He is the youngest college president in the United States. His administration has revolutionized the University. Two new departments have been added: The School of Oratory and the Conservatory of Music. A magnificent new dormitory has been erected on the campus. The equipment has been very much improved; the student body greatly increased. Total enrollment, 1903–4, 648. The University has two splendid training schools, one for boys, the other for girls, in Lebanon. The institution is coeducational.

P. Marion Simms,
Registrar of Cumberland University.

Cumbrian Mountains, a range of hills, England, occupying part of the counties of Cumberland, Westmoreland, and North Lancashire. The mountains rise with steep acclivities, enclosing in some parts narrow but well-cultivated valleys, with numerous picturesque lakes, this being the English "Lake Country," so much frequented by tourists.

Cumin, kŭm'ĭn, **Oil of,** the expressed product of a long-known umbelliferous plant, grown in Egypt and Ethiopia, and largely cultivated in Sicily and Malta, whence it is brought to this country. Cumin seeds, when distilled with water, yield a pale-yellow limpid oil of disagreeable odor and harsh taste, consisting of an oil called cuminol, hydride of cumyl, or cuminic aldehyde ($C_{10}H_{12}O$), and cymene or cymol ($C_{10}H_{14}$). Cuminol and cymol can only be partially separated by distillation, cymol being the more volatile, but cuminol is better removed by causing it to combine with hydropotassic sulphite. When pure, cuminol is a colorless liquid, lighter than water, boiling about 430° F. The other constituent, cymol ($C_{10}H_{14}$), is a colorless, strongly refracting, lemon-smelling fluid, which has a specific gravity of 0.85, and boils about 350° F. It is insoluble in water, but dissolves in alcohol, ether, and oils.

Cuminum, the fruit of *Cuminum cyminum,* a close relative of caraway, with which it is allied in properties and uses. See Cumin, Oil of.

Cumming, Alfred, American territorial governor: b. 1802; d. 1873. When the Mormons under Brigham Young disputed the authority of the Federal government, President Buchanan, in 1857, sent Cumming to Utah as governor, with a force of 2,500 men. He at once declared the territory to be in a state of revolt, to which Young replied by a proclamation forbidding the army to enter the territory. It was not until 1858 that Cumming regularly assumed office, in which he was supported by the troops for nearly two years. Cumming held the position until 1861. See Utah.

Cummings, Amos Jay, American journalist: b. Conkling, N. Y., 15 May 1841; d. Baltimore, Md., 2 May 1902. At the age of 12 he entered a printing office as an apprentice, and was accustomed to say that he had set type in nearly every State in the Union. He was with Walker in the last invasion of Nicaragua; was a sergeant-major in the 26th New Jersey Infantry during the Civil War; and received

the congressional medal of honor for gallantry on the battlefield. In 1863 he entered the service of the New York *Tribune* under Greeley, and later was on the staff of the New York *Express* and the *Sun* successively. From 1887 until his death he was a Democratic representative in Congress from New York city districts.

Cummings, Charles Amos, American architect: b. Boston, 26 June 1833. He was educated in the Boston schools and at the Rensselaer Polytechnic Institute, Troy, N. Y., and till his retirement, some years since, practised his profession in his native city. He published a valuable 'History of Architecture in Italy from the Time of Constantine to the Dawn of the Renaissance' (1901), and collaborated with W. P. P. Longfellow (q.v.) in 'A Cyclopædia of Works of Architecture in Greece, Italy, and the Levant' (1897).

Cummings, Edward, American Unitarian clergyman: b. Colebrook, N. H., 20 April 1861. He was graduated at Harvard 1883, and from its Divinity School 1885, and was the first incumbent of the Robert Treat Paine fellowship in Social Science 1888–91; studying in England, France, Italy, and Germany. He was instructor in sociology at Harvard 1891–3, and associate professor 1893–1900, when he became associate pastor of the South Congregational Church, Boston, Mass.

Cummings, Joseph, American educator: b. Falmouth, Me., 3 March 1817; d. Evanston, Ill., 7 May 1890. He graduated at Wesleyan University, Middletown, Conn., 1840; entered the Methodist ministry 1846, and held pastorates at Malden, Chelsea, and Boston, Mass., 1846–53. He was president of Genesee College, Lima, N. Y., 1854–7; president of Wesleyan University, 1857–75; professor of mental philosophy and political economy there 1877–9; and president of Northwestern University from 1881 until his death.

Cummings, Thomas Seir, American artist: b. England 1804; d. Hackensack, N. J., 24 Sept. 1894. He studied chiefly under Henry Inman, and worked mostly at miniature painting. He was a founder of the National Academy of the Arts of Design 16 Jan. 1826, an organization of 15 members who each chose another.

Cummins, Albert Baird, American lawyer and governor: b. Carmichaels, Pa., 15 Feb. 1850. He received an academic education at Waynesburg, Pa., was admitted to the bar, and settled in practice at Des Moines, Ia. From 1896 to 1900 he was a member of the Republican National Committee, in 1901 was elected governor of Iowa, in 1903 was re-elected and, again for his third term in 1906.

Cummins, George David, American clergyman: b. Kent County, Del., 11 Dec. 1822; d. Lutherville, Md., 26 June 1876. He was graduated at Dickinson College, Pa., 1841; ordained to the Episcopal ministry 6 July 1847, and was successively rector at Norfolk, Va., Richmond, Va., Washington, D. C., Baltimore, Md., and Chicago, Ill., until consecrated assistant bishop of Kentucky 15 Nov. 1866. In November 1873 he resigned his office and withdrew from the Church, preliminary to taking steps to form a new sect, "The Reformed Episcopal Church," of which he was made the presiding bishop December 1873. (See REFORMED EPISCOPAL CHURCH.) He was formally deposed from the Protestant Episcopal ministry 24 June 1874.

Cummins, Maria Susanna, American novelist: b. Salem, Mass., 9 April 1827; d. Dorchester, Mass., 1 Oct. 1866. Her novel, 'The Lamplighter' (1853) had enormous success and was translated into foreign languages; it is still remembered for the idyllic charm and tenderness of its first few chapters, but the rest is commonplace. Her other books are: 'Mabel Vaughn' (1857); 'El Fureidis' (1860); 'Haunted Hearts' (1863).

Cumnor Hall, a ruined manor house near Oxford, England, the "Cumnor Place" of Scott's 'Kenilworth.' Meikle's musical ballad of 'Cumnor Hall,' a lament for Amy Robsart, furnished Scott, as is supposed, with the motive of 'Kenilworth.'

Cumulative Voting, the system by which every voter is entitled to as many votes as there are persons to be elected, and may give them all to one candidate, or may distribute them among the candidates, as he thinks fit. The practice was first introduced into Great Britain in 1870, and used in the election of school boards, and later in parliamentary elections. Although the general adoption of the system has been urged as a desirable reform it has not had much success. The States of Illinois and Michigan have used the method in some elections, and its legality was questioned. The supreme court of the latter State declared it constitutional.

Cumyn, Comyn, or **Cumming,** a family whose name appears frequently in the early history of England and Scotland. It had its possessions near the town of Comines, and from one of the branches sprang the historian Philip de Comines (q.v.). The English Comyns came over with the Conqueror, and in the middle of the 13th century the family counted among its members 4 Scottish earls, 1 lord, and 32 belted knights. In the beginning of the 14th century it was almost annihilated by its rival competitor for the Scottish crown, Robert Bruce. Such of the Cumyns as contrived to escape made their way to the English court, and by their talents secured considerable influence in the sister kingdom.

Cunard', SIR **Samuel,** English ship-owner: b. Halifax, Nova Scotia, 21 Nov. 1787; d. London 28 April 1865. Becoming early a successful merchant and ship-owner, he went to England in 1838, and joined with George Burns and David M'Iver in founding (1839) the British and North American Royal Mail Steam Packet Company. The first passage was that of the Britannia in 1840. From its small but successful beginning, Cunard's undertaking soon developed into one of the most influential private commercial enterprises. He was knighted in 1859.

Cunaxa, kū-năks'a, Mesopotamia, east of the Euphrates, about 60 miles north of the site of the ancient city of Babylon. Famous in history for the defeat of the younger Cyrus, 401 B.C. See XENOPHON.

Cundall, Frank, English librarian: b. 1858. He has been librarian of the Institute of Jamaica at Kingstown from 1891, and is the author of 'Reminiscences of the Colonial and Indian Exhibition'; 'The Landscape and Pastoral Painters of Holland'; 'Story of the Life of Columbus and the Discovery of Jamaica'; 'Bibliotheca

Jamaicensis'; 'Studies in Jamaica History'; 'Jamaica' in 'British Empire Series'; 'Hans Holbein.'

Cundinamarca, koon-dē-nä-mär'kä, Colombia, a department bounded on the north by Venezuela and the departments of Boyacá and Santander, on the east by Venezuela, on the south by the department of Cauca, and on the west by the departments of Antioquia and Tolima. Area 79,810 square miles. Its capital, Bogotá, is also the capital of the republic. (See BOGOTÁ and COLOMBIA.) The eastern Cordillera of the Andes traverses the department from south to north, separating into various branches. On the west lies the valley of the Magdalena River, above which rise the highest mountains, the Nevado of Sumapaz, Cruz-Verde, the «páramos» of Chamizal, Pasquilla, El Hato, and Choachi. On the east is a great plain, fertile and abounding in cattle. There innumerable streams form the Meta and Guayabero rivers, which belong to the Orinoco system; the more important of these tributaries being the Cabuyaro, the Guatiquia, Rio Negro, the Guayuriba, the Chichimene, the Gumal, and the Pajure. Rivers of the western region, belonging to the Magdalena system, are the Fusagasugá, the Seco, the Bogotá (which in its upper reaches, above the splendid falls of Taquendama, is called the «Funza»), etc. In the centre of the department are the elevated plains of Bogotá, Ubaté, and Simijaca. Pop. 569,000.

Cundurango, kŭn-dŭ-răn'gō, the bark and wood of a vine growing in Ecuador, South America, supposed at one time to be a specific for cancer.

Cuneiform Writing is so called because its characters consist of strokes of the shape of a wedge (Latin, *cuneus*); and for a like reason it is also known as arrow-headed: it is a mode of writing widely used in early times, and till the downfall of the Babylonian and Assyrian empires, in the region of the Euphrates and Tigris and in contiguous countries lying northward and eastward of those empires, as Armenia, Persia, Media, Susiana. This manner of writing was an outgrowth of a primitive hieroglyphy most probably originating among the peoples of that part of western Asia and not derived from Egypt. For an account of the archæological researches in Babylonia and Assyria see the article BABYLONIA, where the invention of cuneiform writing is credited to the Accadian population of Chaldæa, from whom it passed to a Semitic people, their conquerors, later known as Babylonians and Assyrians. Before the conquest the cuneiform writing of the Accadians had been adapted by them not only to ideographic representation — representation of objects or notions, as the sign $ denotes dollar or as in astronomy the trident ♆ stands for the planet Neptune — but also to representation of sounds. This was a step in the direction of alphabetic writing, but the cuneiform system never reached that ulterior development, and its highest achievement was the production of a syllabary — a catalogue of the syllables of the language. The transition from the ideographic to the phonetic use was a long step toward perfection as it immensely simplified the problem of writing by reducing to a comparatively small number of different characters the infinity of emblems required for ideographic representation. It was as though a sign, as , originally, let us suppose, the ideograph for tree, were made to stand for the syllable ta, to, etc.: in that case all words beginning with the syllable ta or to would be represented by a form of expression having that sign for its first element, and not by an independent arbitrary form.

The cuneiform writings found among the ruins of the Assyrian, Babylonian and other ancient cities of Western Asia were either impressed with a stylus on tablets of moist clay which was then kiln-baked or they were incised with a chisel on monuments of stone. The wedge either stands upright, or inclined at an angle, or lies horizontal, or two wedges form an angle coming together at their points, or at their bases. A few examples will give an idea of the manner of combining them for the expression of ideas:

In its stage of highest development the cuneiform writing was exceedingly complex and clumsy, and the fact that it was made to serve so well as it did the needs of the Babylonians and Assyrians as a means of literary expression, as the vehicle of laws and as a means of historical record, gives striking demonstration of man's invincible effort to develop his intellectual and moral powers. It was a very simple thing to make the ideograph speak to the ear as well as to the eye — to represent, for example, the sun (utu) by an ideograph and then to make that symbol stand for the syllable ut in all situations; but it was a beginning, and out of it was constructed as efficient a mechanism as was allowed by the refractoriness of the material of construction. But the cuneiform writing never gave any indications of a tendency toward an alphabetic system.

The results of archæological exploration in those countries of western Asia are justly regarded as among the most valuable of modern historical research. They put us in possession of much of the literature and much of the early history of peoples whose record seemed already lost past recovery as far back as the time of Herodotus (5th century B.C.) or at least of Berosus (3d century B.C.) of whose writings only some fragments have come down to us: our knowledge of the history of those great empires, beyond a few incidental notices in the Bible, was drawn mainly or wholly from those two historians; but now, thanks to the researches of our contemporaries, we have with regard to many points of Assyrian and Babylonian history fuller and more authentic information than we possess regarding the history of ancient Greece and Rome.

No one document of the thousands that have been unearthed in the course of those explorations surpasses or even equals in interest the code of King Khammurabi (the Amraphel of Genesis xiv. 9, «King of Shinar» or Elam, called also in the Scripture Shushan, and by the Greeks and Latins Susiana, from the name of the capital city Susa). This code, discovered at

the site of ancient Susa in 1901, afterward translated by the Dominican friar Schiel, who was the Assyriologist of Monsieur de Morgan's exploring expedition, and published in 1903 by order of the French minister of public instruction, is inscribed on a great monolith of granite; it dates from 2200 B.C. It consisted originally of about 3,000 lines of writing in 49 columns, five of which are effaced; but the rest of the inscription, being of a very beautiful type, is still plainly legible. The code begins with a law relating to witchcraft or sorcery, and touches all grades of social and domestic life, even determining the wages of workmen and laborers from the lowest to the highest. Very curious is the law regarding enchantments or sorcery. The person on whom the spell of enchantment has been laid must plunge into the Euphrates: if he sinks and drowns, his house goes to the sorcerer; but if he floats the sorcerer forfeits his life and his house. Proof of the general use of writing in Khammurabi's dominions is seen in the requirement of written testimony in lawsuits and in business transactions. The code commands that land be kept in cultivation; uncultivated and unimproved land is taxed at the same rate as neighboring cultivated land. The farmer whose crop is seriously damaged by storm is excused from paying interest on money loaned him. He through whose neglect the irrigation canals and ditches cause damage must make good the loss. The wine-shop keeper — usually, it would appear, a woman — is required to "seize and drive to the palace" riotous persons who resort to her place: failing to do this she incurs the penalty of death. The defamer of an honest woman, be she wife or "votary," is to be branded on the forehead. A man was permitted to divorce his childless wife. If a man divorces his wife without cause he must allow her alimony and custody of her children, also a share in his estate equal to a son's portion. Here are some points at which Khammurabi's code touches matters which were afterward made the subject of Hebrew legislation. Says the Elamite king: "If a man strike another in a quarrel and cause him a wound and he shall swear 'I did not strike him knowingly' he shall answer for the doctor." The Hebrew law (Deut. xxi. 19) prescribes as penalty for one who smites another with stone or fist so that the injured man keepeth his bed, that the smiter shall "pay for the loss of his time and shall cause him to be thoroughly healed." The Hebrew law punished with death "him that smiteth his father or his mother"; the punishment decreed by Khammurabi for the same offense was loss of the hands.

JOSEPH FITZGERALD,
Author of 'Word and Phrase.'

Cunene, koo-nā'nĕ, a river of South Africa, rising in about lat. 13° S. and entering the Atlantic in lat. 170° 18′ S. It flows at first in a southerly direction and afterward in a westerly direction. In its lower course it forms the boundary between the Portuguese and German territories in that region. At the mouth are sandbanks, and farther up several cataracts.

Cunner, or **Chogset** (*Ctenolabrus adspersus*), one of the commonest of shore fishes on rocky ledges along the New England coast, and found from Virginia to Newfoundland. It rarely attains a length of one foot, and is of a brownish-blue color with yellowish reflections; the teeth are strong and sharp. Although an excellent panfish and a great favorite with the boy angler, its great numbers and its boldness render it a great pest to the professional fisherman, whose bait it continually strips from the hooks.

Cunningham, Allan, Scottish poet and miscellaneous writer: b. Keir, Dumfriesshire, 7 Dec. 1784; d. London 30 Oct. 1842. When a youth he served as an apprentice to a stonemason; but later became a reporter in London, and wrote: 'Sir Marmaduke Maxwell,' a dramatic poem, and 'Lord Roldan' and 'Paul Jones,' interesting but rather theatrical romances. Other works are: 'Traditional Tales of the Peasantry' (1822); 'The Songs of Scotland, Ancient and Modern' (1825); 'Lives of the Most Eminent Painters, Sculptors, and Architects' (1829–33). He will be longest remembered for his song, 'A Wet Sheet and a Flowing Sea.'

Cunningham, John F., Roman Catholic bishop; b. Irremore, county Kerry, Ireland, July 1842. He was graduated at St. Benedict's College, Atchison, Kan., 1860; studied theology in Milwaukee, Wis., and was ordained priest at Leavenworth, Kan., 1865. He was pastor at Fort Scott, Kan., 1865–8; Lawrence 1868–76; Topeka 1876–82; rector of Leavenworth Cathedral 1882–98, and was consecrated bishop of Concordia, Kan., 21 Sept. 1898.

Cunningham, William, English historical writer and clergyman: b. Edinburgh 29 Dec. 1849. He was educated at Edinburgh and Cambridge and took orders in the Anglican Church in 1873. He was chaplain of Trinity College, Cambridge 1880-91, and lecturer there from 1891; was professor of economics at King's College, London, 1891–7, and was lecturer on economic history at Harvard University in 1899. He has published: 'Growth of English Industry and Commerce'; 'Outlines of English Industrial History'; 'Western Civilization'; 'Modern Civilization in Economic Aspects'; 'Use and Abuse of Money'; 'Alien Immigrants to England.'

Cunninghame-Graham, Robert Bontine, Scottish writer: b. 1852. He was educated at Harrow and sat in the House of Commons for North Lanarkshire 1886-92. He has published: 'Notes on the District of Menteith' (1895); 'Father Archangel of Scotland and other Essays' (1896); 'Aurora la Cujini' (1898); 'Journey in Morocco' (1898); 'The Ipane' (1899); 'Thirteen Stories' (1900); 'A Vanished Arcadia' (1901).

Cunningham'ia, a genus of the *Coniferæ,* so named in honor of the botanists and travelers I. and A. Cunningham. The single species of the genus *C. sinensis* is a tall and handsome tree, native of China and Cochin-China, with leathery leaves somewhat resembling those of the *Araucaria* (q.v.). It is too tender for the ordinary temperate climate, but is used in favorable localities as an ornamental tree, though never seen in its full beauty except in its native country, as the transplanted specimens must be small enough to be protected from the slightest frost. It is therefore known generally as a house-plant.

Cup, a name for a refreshing beverage, made usually of wine, soda-water, ice, and flavoring ingredients, such as claret cup, champagne cup, etc.

Cup-and-saucer Limpet, shells of the gastropod genera *Calyptræa* and *Crucibulum,* so called from having in the middle of the inside of the shell a cup-like process, the shell proper constituting the «saucer.» *Hipponyx* is another form. *Crucibulum striatum* occurs off shore on our coast.

Cup, Divination by, a mode of foretelling events, in use among the ancient Egyptians, and still surviving in some of the rural districts of England and Scotland. In the East, one method was to put small pieces of gold, silver, and precious stones engraved with mystic characters into a cup of water, then to invoke the infernal powers, who replied by some signs in the cup. By the modern method, a person's fortune is foretold by the disposition of the sediment in his teacup after pouring out the last of the liquid.

Cup-sponge. The cup-sponge of Turkey (*Spongia adriatica*), also called the Levant toilet-sponge, is one of the finest sponges brought from the Mediterranean Sea. See SPONGE.

Çupay, soo-pā, or **Supay** («the shadow»), the Peruvian god of the dead, the Pluto of their pantheon, corresponding to the Mictla of the Mexicans. He was supposed to rule the land of shades in the centre of the earth. To him went all souls not worthy to become the sun god's associates.

Cupel, kū'pĕl or kŭp'ĕl, a shallow earthen vessel, made of bone ashes, and extremely porous, used in assays to separate the precious metals from their alloys. The process of cupellation consists in fusing an alloy of a precious metal, along with a quantity of lead, in a cupel. The lead is easily oxidized, and at the same time promotes the oxidation of other metals, and vitrifies with their oxides. The foreign metals are thus removed; the vitrified matter is absorbed by the cupel, or is driven off by the blast of the bellows as it collects on the surface; and the precious metal at length remains pure. The cupel is described in terms almost identical with those of the present time in one of the oldest extant mediæval works on chemistry.

Cupid, in Roman mythology, the god of love, similar to the Greek Eros, the son of Mercury and Venus. He is usually represented as a winged infant, naked, armed with a bow, and a quiver full of arrows. Sometimes he was represented with a helmet, a spear, and a buckler, intimating that even Mars himself owns the superiority of love. His power was generally shown by his riding on the back of a lion, or on a dolphin, or breaking to pieces the thunderbolts of Jupiter.

Cupola, in architecture, a hemispherical semi-elliptical roof, built of stone, timber, metal, or glass. The ancient cupolas were hemispherical, and were used with great effect by the Romans. The greater part of modern cupolas are semi-elliptical, cut through their shortest diameter. Of ancient cupolas, the finest is that of the Rotunda or Pantheon at Rome, erected under Augustus, and still perfect; of modern construction, some of the handsomest are those of Saint Peter's at Rome, of Saint Paul's, London, the Hotel des Invalides, Paris, Santa Maria da Fiori at Florence, Saint Sophia at Constantinople, and the national capital at Washington, D. C. The term is also applied to any small structure rising above the roof, not necessarily spherical, but of any shape.

Cupping, the process of applying small cups to the skin for the purpose of causing local irritation or local abstraction of blood. The cups that are ordinarily employed are small glass half-spheres, connected with a rubber bulb by means of which the air may be exhausted and the cup applied. This results in drawing up into the cup a certain amount of skin area, which subsequently becomes filled with blood. The local abstraction of blood, however, does not explain the physiological action of the cups. The action is really that of an irritant, which, affecting the skin area, causes a reflex effect on a related visceral area somewhere in the body. The cups are termed dry cups or wet cups according to whether the skin is punctured or unpunctured. With wet cups the blood is drawn from the skin directly. Cups are useful in the early stages of acute congestion such as occurs in the lungs, or they may be applied to other organs. Cupping may also be performed by the ordinary tumbler in which a small amount of alcohol is permitted to burn. This heats the air and thus causes, on cooling, a partial vacuum when the cup is applied to the skin.

Cupples, George, Scottish sketch and story writer: b. Legewood, 2 Aug. 1822; d. 7 Oct. 1891. His best known work is 'The Green Hand,' a stirring tale of the sea.

Cupples, Samuel, American manufacturer: b. Harrisburg, Pa., 13 Sept. 1831. At the age of 12 he was employed in a grocery store in Pittsburg, but removed to Cincinnati in 1846, where he entered a wooden-ware establishment. In 1851 he was sent to Saint Louis to establish a branch house there, which as the house of Samuel Cupples & Company became widely known. In 1883 this was recognized as the Samuel Cupples Woodware Company, of which its original founder is still president. It is the largest business of its kind in the world, its trade equaling in amount that of all other wooden-ware houses in the United States. He has taken a warm interest in education and has done very much to sustain the school system of Missouri. He was the original promoter of the Saint Louis Manual Training School and his gifts to educational institutions have amounted to several millions. See CUPPLES STATION.

Cupples Station, a railway junction in Saint Louis established by Samuel Cupples (q.v.) and others. Here has been erected an extensive system of railroad warehouses whose basements are traversed by railroad tracks. Merchants are thus enabled to receive and re-ship goods with the expense of handling them reduced to a minimum, the expense and delay of cartage being eliminated from the problem. This vast property has recently been presented by Samuel Cupples and his partner R. S. Brookings, to Washington University, this institution collecting all rentals therefrom.

Cuprite, kū'-prīt, native cuprous oxide, Cu_2O. It is the richest of the copper ores and occurs earthy, massive and granular, and also

in beautiful isometric crystals which in the variety chalcotrichite are elongated into capillary crystals. Usually it is translucent, of adamantine luster and very dark cochineal-red color. Its hardness is 3.5 to 4 and specific gravity about 6. Among its many important localities are Chessy in France, Cornwall in England, South Australia and Chile, and in the United States at Bisbee and Morenci in Arizona.

Cur, a dog of any kind not highly valued, and in this way often particularly appropriated to dogs of mongrel breed. Naturalists use the term cur as the common designation of many races, of which the terrier may be considered as the type.

Cura, koo'rä, also **Ciudad de Cura,** Venezuela, a city situated 56 miles west of Caracas and a short distance from Lake Valencia, in the old state of Miranda (now separated into the states of Rivas, Guárico, and Miranda). It was founded in 1730 by Juan Bolivar y Villegas. The site of Cura is 1,600 feet above sea-level at the foot of a steep hill; an extensive valley, watered by two streams, outspreads before it. A record of its temperature shows as the maximum 87° F.; minimum 72°; mean annual 79° F. Owing to its proximity to the savannas of the Guárico, and the surrounding agricultural and grazing districts, with their plantations of sugar-cane, coffee, cacao, cotton, indigo, etc., as well as herds of cattle, Cura is a thriving little place. Pop. somewhat more than 10,000.

Curaçao, koo-rä-sä'ō or kū'ra-sō, an island, one of the Dutch West Indies, in the Caribbean Sea; 46 miles north of the coast of Venezuela; between lat. 12° 3′ and 12° 24′ N., and lon. 68° 47′ and 69° 16′ W.; stretching northwest to southeast; 36 miles long and 8 miles broad; capital Wilhelmstad. The chief minerals are iron and copper (but the mines are not developed), and salt. The cocoa-palm, banana, and three varieties of the orange — from one of which varieties the far-famed Curaçao liqueur is made — grow abundantly. Curaçao was settled by the Spaniards early in the 16th century; it was taken in 1632 by the Dutch; and was captured by the British in 1798, but restored at the Peace of Amiens. It was taken again by the British in 1806, and finally ceded to Holland at the general peace in 1814. Pop. (1900) 30,642; including the dependencies, 51,943.

Curaçao, or **Curaçoa,** the genuine Dutch liqueur of this name, so much esteemed for its taste and aroma, is prepared from a peculiar kind of bitter oranges growing in Curaçao, which fall from the tree before they are ripe, and which have an extremely persistent aromatic odor and taste. The rind of the orange is macerated, the white pulpy matter scraped off, and the yellow part, along with yellow fresh oranges, steeped in strong alcohol for 24 hours. The liquor is distilled and rectified, about half being collected, and this is mixed with a syrup made of fine white sugar. To this is added a certain quantity of curaçao infusion, which is a stronger alcoholic extract of the peel containing sugar, and then a certain proportion of water. The fluid is clarified and allowed to settle. The finest quality has a deep yellow color, which is sometimes improved by a few drops of tartaric acid.

Curari, koo-rä'rĭ, **Curare, Ourari,** etc., an arrow poison widely used by the natives of South America. Its exact composition is unknown, but it is certain that the juice of some species of *Strychnos* is always present. No species of *Strychnos* that is now known, however, has the same physiological action that curari has. Its method of preparation is kept secret and it is probably true that each tribe has its own method of preparing the poison. The physiological action of curari is unique. It is a type of pure motor paralysant, affecting the motor end organs in voluntary muscles. In death by poisoning from curari, the muscles of respiration becoming paralyzed, asphyxia results. Therapeutically, curari is of secondary service. Its varying composition and uncertain strength make it dangerous, and theoretically it would be indicated only in motor disorders of the voluntary muscles such as convulsive tics, torticollis, hydrophobia, etc. In the treatment of poisoning, artificial respiration is the best procedure.

Curassow, kū-răs'ō, a bird of the subfamily *Cracinæ* and family *Cracidæ,* related to the guan (q.v.) and mound-bird (q.v.), and with these occupying the border between the *Columbæ* and *Gallinæ,* and most often grouped with the latter, but resembling the former in having the hallux on the same level as the other toes. The name is derived from the supposed origin of those first known to Europeans from the island of Curaçao. The curassows are exclusively birds of tropical America and are especially abundant in the forests east of the Andes. They are large, sometimes equaling the turkey in size, with handsome plumage and in some varieties crested head. Usually the trachea of the males forms a loop within the sternum, as in certain cranes, and renders possible the clear ringing voices of these birds. They are chiefly arboreal, but also scratch on the ground for their food, which consists largely of nuts, berries, and tender leaves. Most species also nest in trees and, as the young are precocial, a curious sight is presented by their scrambling among the branches while still in the down. Being highly prized for food, some of the species have been domesticated and are said to hybridize readily with the common barnyard fowl. The genera are *Crax,* with a soft cere and crested head; and about 10 species in Central and South America. The *Nothocrax* has no cere, and the lores, or spaces between the eyes and beak, are naked. *Mutua* is similar, but the lores are feathered; *M. mitu* is a beautiful blue-black species of Brazil and adjoining countries to the north. *Pauxi* contains the well-known *P. galeata* of zoological gardens, in which the frontal region of the head bears a large, deep blue knob. It is a native of the extreme northern parts of South America. Interesting accounts of these birds will be found in Bates, 'Naturalist on the River Amazon' (1863).

Cura'tor (Lat. "care-taker"), in civil law, a term signifying the guardian of a minor who has attained the age of 14. Before that time minors are under a tutor. The guardianship of persons under various disabilities, and of the estate of deceased or absent persons and insolvents, is also committed to a curator. In learned institutions the person who has charge of the library or collections of natural history, etc., is often called a curator.

Curb, a disease in horses consisting of strain of the straight ligament which runs down the back of the hock. It is most common in animals with straight small hocks and sickle hams. Like other strains it occurs from sudden and violent exertion, often proceeding in the lighter breeds from leaping or galloping in heavy ground, and in the heavier, from the effort of keeping back a load while going down a steep incline. Swelling appears on the outer and back part of the joint, about five or six inches below the point of the hock, generally causing lameness, most apparent in trotting, and, in slight cases, usually decreases after the animal has been out for 10 minutes. Fomentations must first be used to allay the irritation and inflammation, and a high-heeled shoe put in. When heat and tenderness disappear, cold applications will be advisable; after which, the enlargement still continuing, a blister may be necessary. From the first all work must be forbidden.

Curbina. See DRUM.

Curculio, kėr-kū'lĭ-ō, an insect-enemy of the plum. See paragraph *Insects,* under PLUM.

Curculionidæ, kėr-kū-lĭ-ŏn'ĭ-dē, the snout-beetles, or weevils (q.v.). One of the most extensive families of coleopterous insects. They belong to the section *Tetramera,* and all the species have a curious snout-like head.

Curcuma, kėr'kū-mą, a genus of the gingerwort and cardamom order. The corm is about as thick as the thumb, and is divided into several parts. The leaves which are about a foot long are lanceolate in form and sheathing. *Curcuma longa* is a turmeric plant, the tuberous rhizomes of which furnish the substance called turmeric (q.v.). This plant is extensively cultivated in southern Asia. *C. amada,* a native of Bengal, is the mango-ginger, which has qualities resembling ginger. From the colorless rhizomes of *C. leucorhiza* is prepared a kind of arrowroot. *C. zedoaria* yields a tonic medicine, and is also used as a food.

Curd. See CHEESE.

Cures, kū'rēz, an ancient town of the Sabines, 25 miles northeast of Rome, whence the Romans, after the people of Cures united with them, came to be called Quirites.

Curfew, kėr'fū, also **Curfeu,** from the French *couvrir,* to cover, and *feu,* fire. The ringing of a bell at nightfall, originally designed as a signal to the inhabitants to cover their fires, extinguish lights, and retire to rest. The practice is said to have been instituted by William the Conqueror, in all probability as a safeguard against fire, but the English in early days regarded the curfew as a badge of servitude. Originally the hour set for the ringing of the curfew bell was 8 o'clock, but it was also rung at 9 o'clock. The bell in each village or community which tolled the curfew became known as the curfew-bell. In certain parts of rural England the custom is still kept of ringing a bill at 9 o'clock.

The curfew bell was introduced into the United States early in the century, but without regularity of practice. About 1880 Col. Alexander Hogeland, who has been called "the father of the curfew-law," introduced an ordinance in Omaha, Neb., compelling youths to absent themselves from steamboat landings, railroad stations, and low variety shows. The curfew ordinance, somewhat changed and modified, was adopted in 1894 at Lincoln, Neb. The term curfew-law has since been given to all laws intended to keep young people off the streets after a certain hour, generally 9 o'clock at night. In 1894 at the National Convention of the Boys' and Girls' Home Employment Association in Indianapolis, the adoption of curfew ordinances was urged in view of the great increase in crime among children. Since that time the law has been generally enforced in over 3,000 cities and towns in this country. The officials of many of these towns report a decrease of 80 per cent in the arrest of boys and young men, under the provisions of the law, and former objections to the curfew have ceased. In 1898, a consensus of opinion was taken in 300 towns where the curfew law was in operation and all reports showed that there was a decided improvement in the youth morally and socially.

The curfew law, in general use, provides that all children under 15 years of age shall not be on the streets at night after 9 P.M. in summer and 8 P.M. in winter, without the written consent of their parents or guardians. The law has been endorsed by city officials, commercial associations, school boards and boards of trade in various sections of the country. The enforcement of the law has largely reduced the number of commitments to reform schools as is illustrated at the State Reform School at Boonville, Mo. During two years prior to the adoption of the curfew ordinance at Kansas City, Mo., 47 boys were sent to the reform school while for two years after the adoption of the law only 17 boys were committed from Kansas City. The ordinance has been recognized as a crime-reducer, child protector, and home builder. Benjamin Harrison called the curfew-law, "the most important municipal regulation for the protection of the children of American homes, from the vices of the street, of the present century."

Curi-cancha, koo-rē-kän'chä, the splendid Temple of the Sun, built by the Incas in Cuzco, Peru, on the site now occupied by the church of San Domingo. See CUZCO.

Cu'ria, a certain political division of the Roman people, said to have been established by Romulus; also the place of assembly for each of these divisions. According to Livy, Romulus divided Rome into 30 curiæ, and assigned to each a separate place of meeting. In early times only the members of the curiæ were in possession of the full citizenship of Rome.

Curia Roma'na, the body of officials who under the Pope administer the government of the Roman Catholic Church, or in a wider sense the entire court of the Pope. The relations of the Roman see to the secular powers are conducted through the cardinal secretary of state; under him are nuncios and other diplomatic agents of the Holy See. The Pope acts as the supreme judge in the Church, either through special delegated judges or through regular tribunals, the Rota and Segnatura for causes in the *forum externum* and the Penitentiaria for those in the *forum internum.* In the Roman Chancery are drafted and expedited the bulls and briefs by which the mind of the pontiff is made known to Christendom or to

individuals. The Rota and the Segnatura are tribunals for determination of questions of canon and ecclesiastical law whether in the first instance or on final appeal.

For the different congregations of the College of Cardinals, or the standing committees, see CONGREGATIONS, ROMAN.

Curiatii. See HORATII.

Curicó, koo-rē-kō′, Chile, a province lying between Colchagua and Talca. Area 2,915 square miles. It is divided into the departments of Curicó and Vichiquen. Its capital city, also called Curicó, has two commercial banks, several tanneries, and other industrial establishments. The port of Llico is on the Lake of Vichiquen. Numerous irrigating canals are derived from the Teno and Lontue, which unite to form the Mataquito River. Cereals, vegetables, wine, cattle, timber, and fruits are among the products; there are also a few copper, silver, and gold mines in the Cordillera and the coast range of hills, and the annual output of salt from the estuaries of the lakes of Vichiquen, Boyeruca, and Bucalemu exceeds 25,000 tons. The State Central Railroad crosses the province. Pop. (province) 115,000, (city) 15,000.

Curie, Pierre and Marie, distinguished physicists, the former French and the latter Polish, of whom a writer in the *Scientific American* has said that "they afford an example of a most interesting collaboration, since it concerns a husband and wife, both of high scientific attainments, who aided one another with their efforts and knowledge in the arduous path that finally led to the production of pure radium." M. Curie was born in 1859; d. Paris, 19 April 1906, and at the age of twenty years began to make independent scientific researches. In 1895 he received his appointment as professor of physics and chemistry, having discharged the duties of *chef de travaux* up to that time; and the future husband and wife met as teacher and pupil. Marie Sklodowska (born at Warsaw Nov. 1868) completed the usual course of study at the Warsaw *gymnasium* about 1884; afterward worked in the laboratory of physics of the Industrial Museum; in 1891 went to Paris and obtained a licentiate's degree in the mathematical sciences (1893), taking a degree in physical and chemical sciences two years later. Before M. Pierre Curie married her she had become instructor in physics at the High School of Sèvres. She entered the path marked out by her husband, and together they continued their experiments in the laboratory of the school of physics and chemistry. Toward the end of 1898 the Academy of Sciences received a communication in which Professor and Mme. Curie positively confirmed what they had previously announced with respect to a new and strongly radioactive substance derived from pitchblende. In the first place they found an element to which (in remembrance of the country of Marie Sklodowska) they gave the name *polonium;* then their collaboration was rewarded by the discovery of radium (q.v.)

Curitibá, koo-rē-tē-bä′, Brazil, the capital of the state of Paraná, situated on a plateau 2,890 feet above sea-level. It is about 80 miles west of the port of Paranaguá. A wagon-road and a railroad, the latter built in 1885, connect the city with the ocean. A line of steamships running directly between Paranaguá and Hamburg, Germany, is subsidized by the state. From Paranaguá and the neighboring port of Antonina are exported woods, maté, sugar, and cereals. Pop. about 15,000. See also PARANÁ, the state.

Curlew, kėr′lū, shore birds of the genus *Numenius,* belonging to the snipe family (*Scolopacidæ,* q.v.). In this genus the bill is long, slender, and arcuate, and the toes are rather short, thick, and margined. Most of the species are of large size for the family, and about 15 are found throughout the world.

The long-billed curlew (*N. longirostris*) is the largest species, its total length sometimes exceeding two feet. It is found throughout temperate North America, but is rare in the New England States. In the interior it is common throughout the Mississippi valley, where, as well as in the south Atlantic States, it breeds, laying three or four eggs on the ground in meadows or prairies. Like other species its principal food consists of worms, crustaceans, and insects, but vegetable matter is also eaten. The Hudsonian curlew (*N. hudsonicus*) is smaller, with the bill scarcely more than one half as long and the color of a less rufous tone than the last. It is more a bird of the North, breeding in the Arctic regions, and migrating through the United States. The common curlew, Eskimo curlew, or dough-bird of gunners, (*N. borealis*) is still smaller, having a total length of 12 to 15 inches, and a bill of only 2 or 3 inches. This bird is remarkable for its extensive migratory movements in the spring and fall. Like the Hudsonian curlew it breeds in high northern latitudes, but winters still farther south in tropical America. During the migrations it abounds along the eastern seaboard of the United States. Consult: Elliot, 'North American Shore Birds' (1895).

Curling, a Scottish game played on the ice, with large smooth stones of a hemispherical form, with an iron or wooden handle at the top, which the players slide from one mark to another. The space within which the stones move is called the "rink," and the hole or mark at each end the "tee." The number of players upon a rink is 8 or 16 — 8 when the players use 2 stones each, and 16 when they use 1 stone each. The object of the player is to lay his stone as near to the mark as possible, to guard that of his partner which has been well laid before, or to strike off that of his antagonist. When the stones on both sides have been all played, the stone nearest the tee counts one, and if the second, third, fourth, belong to the same side, each counts one more.

Curly-grass, a common name for a fern (*Schizæa pusilla*), the typical genus of the climbing fern family. The plant is rare, being occasionally found in wet soil in the pine barrens of New Jersey and in Nova Scotia. The climbing fern family has 16 genera, of wide geographical distribution, the 2 American genera being *Schizæa,* as above, and *Lygodium,* represented by the Hartford fern (q.v.).

Curran, Charles Courtney, American artist: b. Hartford, Ky., 13 Feb. 1861. He studied art in Cincinnati, the New York Art Students' League, and the Académie Julien in Paris, France, receiving an honorable mention in the Salon of 1890. He has been awarded several of the prizes of the National Academy of Design, and received medals at the World's Columbian Exposition and the Cotton States International Exposition.

Curran, John Philpot, Irish orator: b. Newmarket, near Cork, 24 July 1750; d. Lon-

CURRANTS.

don 14 Oct. 1817. He was educated at Trinity College, Dublin, after which he went to London and studied at one of the inns of court. In 1784 he was chosen a member of the Irish House of Commons. His abilities now displayed themselves to advantage, and he became the most popular advocate of his age and country.

Curran possessed talents of the highest order: his wit, his drollery, his eloquence, his pathos, were irresistible; and the splendid and daring style of his oratory formed a striking contrast with his personal appearance, which was mean and diminutive. See Davis, 'Life of Curran' (1846); Phillips, 'Curran and His Contemporaries' (1850).

Currant, originally, the small black, seedless raisins popularly used in cookery, and so named from the Greek city of Corinth, where they first became commercially important; by extension, various species of the genus *Ribes* and their fruits. The former belongs to the genus *Vitis* (see GRAPE) of the natural order *Vitaceæ* or *Ampelideæ;* the latter to the *Saxifragaceæ.* Only the thornless species of the latter genus which bear grape-like clusters of smooth fruits are called currants; the spiny species are known as gooseberries.

The most widely cultivated species is unquestionably the red currant (*R. rubrum*) which has developed several white horticultural varieties as well as numerous red ones which are commercially important, both in the fresh state and when manufactured into jelly. The black currant (*R. nigrum*) is next in importance as a fruit but is less popular in America because of its peculiar flavor, less prolific habit, and smaller range of usefulness. The first is a native of the north temperate zone, the second, of Europe and Siberia. The American black currant (*R. floridum* or *americanum*) resembles the common black currant but, though sometimes found in gardens, is little esteemed. The flowering currant (*R. aureum*), an American species, has produced several horticultural varieties but is not cultivated for its fruit, which ripens very unevenly, but for its bright yellow sweet-scented flowers which appear in the spring. Several other species are grown for ornament, the most notable of which is the red-flowered currant (*R. sanguineum*) which is found on the Pacific coast from British Columbia to South America. It has developed several varieties which are all attractive in flower but which bear rather dry, bitter berries, erroneously reputed poisonous. Only the first three species are economically important, and that only in the North or in the higher altitudes of the South, where the hot summers injure the bushes. In the dry plains region they succeed only under specially favorable conditions such as irrigation and partial shade, etc. Several unrelated species of plants are called currant, but compared with the above are unimportant.

The currant thrives best in cool, rather humid climates, upon well-drained but moist strong clayey loams, and with less attention to cultivation, pruning, etc., than any other small fruit. However, it will respond liberally to good treatment, and deserves better attention than it usually receives. The plants are generally propagated by means of hard wood cuttings which are transplanted to the field when one or two years old. The usual distances for planting are four by six feet, upon land well prepared by plowing and harrowing. The bushes are cultivated until mid-summer, when a cover crop is sown to be plowed under the following spring. Annually, two or three new stems should be allowed to grow, preferably from below ground, at the centre of the bush, and when this wood has borne fruit twice (that is, when three years old) should be cut out, since younger wood is more productive and less likely to become infested with insects and disease. On this account, training to the tree form is not recommended. A plantation should continue to be commercially profitable for 6 or 10 years after coming into bearing and should yield 100 bushels an acre if properly cared for. Yields of 250 bushels have been reported. Individual plants in gardens should produce from two to four pounds.

Of the many insects that attack the plant, the currant sawfly or currant worm (*Nematus ribesii*) is the best known. It is a European four-winged fly somewhat larger than a large housefly, which lays its eggs upon the midribs of the under sides of the leaves, particularly those near the ground, in early spring. The green, black-dotted worms frequently do considerable damage before their presence is suspected. Spraying with arsenites or hellebore as soon as the leaves appear and at intervals of about a week is a positive remedy. As a result of neglect, however, the bushes are frequently defoliated. A long-horned beetle (*Psenocorus supernotatus*) lays its eggs upon the shoots and branches into which the larvæ burrow and emerge as adults during late spring of the following year. When troublesome the bushes should be heavily pruned during the winter and the prunings burned. This treatment will also destroy another species of borer, the adult of which is a moth (*Sesia tipuliformis*). No practicable remedy has been discovered for the currant fly (*Epochra canadensis*) which sometimes is seriously troublesome, since it attacks the fruit, which ripens prematurely from the presence of larvæ beneath the skin.

All leaf diseases of the currant, the best known of which are anthracnose (*Glæosporium ribis*) and leaf spot (*Septoria ribis*), may be controlled by thorough spraying with a standard fungicide (q.v.). The former of these diseases is characterized by small black spots on the upper surfaces of the leaves and white ones beneath; the latter has black-centred white spots. The leaves fall prematurely in each case. The currant tubercle, a disease which attacks the whole plant, has become locally destructive in some of the Eastern States. The leaves wilt, the fruit colors prematurely, the clusters become small and few, and both foliage and fruit shrivel and fall. The plant soon dies. No remedy is known except prompt digging and burning. No diseased plants should be used for propagation because the disease seems to permeate the whole plant.

Consult: Card, 'Bush Fruits' (1898); Bailey, 'Cyclopedia of American Horticulture' (1900–02).

Currant Insect-pests. The worst pests of currants (and of gooseberries) are the larvæ of two sawflies (q.v.). The most destructive of these is *Nematus ventricosus,* imported into this country about 1860, and since become very widespread. The female, which is bright honey

yellow with the head black, lays her cylindrical, transparent, whitish eggs in May in regular rows along the rims of the leaves on the under side. The embryo escapes from the egg within four days, and in the form of a pale-green worm which begins to eat out holes in the leaves, grows rapidly and after a few days drops to the ground, burrows among the roots, forms a cocoon and pupates. Two broods are raised. There are some 50 species of this genus in the United States, all of which are harmful. Another sawfly (*Pristiphora grossulariæ*) does great damage in the North and West. This female is shining black, with the head and legs yellow. It is later than the other; its worms, which are pale-green, with a black head and a brown side-stripe, appear late in June. Next to these the caterpillars of the yellowish, dark-spotted phalænid moth, *Eufitchia ribearia,* is probably the worst of our "currant worms," and in Great Britain is a noted pest of the gooseberries. They defoliate the bushes as soon as the leaves begin to expand. Another moth, *Ægeria tipuliformis,* of the family *Zygænidæ,* is called the "currant-borer" because its larva bores into the stems in order to pupate, and thus blasts the life of the stem. It is an agile, dark-blue moth less than an inch in expanse, and flies about in the July sunshine. It is an imported pest, and damages the gooseberries and currants of both continents. Another destructive borer is the grub of a small black long-horned beetle (*Psenocerus supernotatus*), which tunnels and kills the branches. To combat these pests, use handpicking and hellebore for the leaf-eaters; trim away in winter all dead and dying twigs, which may contain borers; and in transplanting, free the roots from all possible cocoons.

Currency, any medium of exchange facilitating trade. Originally all exchanges must have been directly by barter. In barter, however, very often it would be difficult to find two persons whose disposable goods suited each other's needs. So some special commodities in general esteem and demand were chosen as a medium of exchange and common measure of value, the selection varying with the conditions of social life. In the hunting state furs and skins have been employed by many nations; in the pastoral state sheep and cattle are the chief negotiable property. Articles of ornament, corn, nuts, olive-oil, and other vegetable products, cotton cloth, straw mats, salt, cubes of gum, bees'-wax etc., at various times have been employed to facilitate exchange. These were not entirely satisfactory, for any suitable medium not only must possess utility and value, but be portable, not easily destructible, homogeneous, readiiy divisible, stable in value, and cognizable without great difficulty. The metals commend themselves as best satisfying these requirements, and in all historic ages gold, silver copper, tin, lead, and iron have been frequent materials of currency. The primitive method of circulating them appears to have consisted simply in buying and selling them against other commodities by a rough estimation of the weight or size of the portions of metal. Sometimes the metal was in its native state, at others in bars or spikes. The earliest money was stamped on one side only, and rather of the nature of stamped ingots than coins as we know them. The need of preventing counterfeiting, and any fraudulent subtraction of metal from the coin, of removing as far as possible anything likely to occasion loss of metal in the wear and tear of usage, and striving after an artistic and historical monument of the state issuing the coin brought about elaboration of designs to cover the whole of a given portion of metal, and nicer determination of quality, size, degree of relief, inscription, etc. While, however, metallic money of a guaranteed standard value was at an early period found to facilitate in a high degree the mechanism of exchange, it was speedily discovered that it was possible in large part to replace the standard gold or silver or copper coins by various forms of currency of a representative character. Standard money depended solely for its value in exchange upon the value of the material of which it was composed; its metallic value and its nominal value were coincident; representative money derived its value from a theoretic convertibility at will into the standard coin. Gradually a series of devices came to be employed to further the interchange of commodities with the least friction and the least possible actual use of the coinage except as a standard and common denominator of value in terms of which exchanges were made. The use of actual specie was found to involve a loss of interest and a risk of more serious loss, and a paper currency based upon credit offered the readiest solution of the difficulty. In this way bank-notes, bills of exchange, and checks — warrants or representative documents convertible, if desired, into standard coin — took their place alongside the metallic currency, partly displacing it, partly extending and supplementing it.

The requisites of circulation are that monetary issues, whether of coin or paper, be from a recognized or official source, and that they admit of being freely returned when necessary to that source. The certification of the fineness of the masses of metal circulating in a community, and the protection from adulteration and fraud, clearly falls among the necessary acts of police. It is still argued, as by Herbert Spencer in his 'Social Statics,' that the coinage should be left to the ordinary competition of manufacturers and traders; but where this occurs currency uniformly becomes debased, and it is generally held, in accordance with the maxims of civil and constitutional law, that the right of coining is a prerogative of the state. In the matter of state supervision two precautions are necessary; that standard coins shall be issued as nearly as possible of the standard weight, and that all coin worn below the least legal weight shall be withdrawn from circulation. The ground for these precautions is to be found in the broad general principle relating to the circulation of money, and known as Gresham's Law (q.v.) that bad money invariably drives good money out of circulation, the heaviest coins being selected for exporting, hoarding, melting, conversion into jewelry, gold-leaf, etc. The law holds good with regard to coins in one kind of metal, and to all kinds of money in the same circulation, the relatively cheaper medium of exchange being retained in circulation, while the other disappears. Of the various systems of metallic currency the first adopted was that known as the single-legal-tender system, in which the state issued certified coins in one metal only. It was

found, however, that in such cases the people invariably circulated for convenience coins of other metals, and there naturally arose out of this the adoption of a double or multiple legal tender system, in which coins were issued in different metals at a fixed rate of exchange. To obviate difficulties arising from the possession of two or more metals as concurrent standards of value, with the constant tendency of one or other to become more valuable as metal than as currency, a third system, the composite-legal-tender, came into existence, in which coins of one metal were adopted as the standard of value, and token coins only issued in the other metals for the payment of small amounts. The last system is that now prevalent in the United States, but the double-legal-tender system, to which the French have long adhered, has been revived in a more philosophic form by economists, and has found an increasing number of advocates for its universal adoption. See BIMETALLISM.

The circulation of representative money differs from that of standard metallic money in that it only circulates within the district or country where it is legally or habitually current. In the payment of debts to foreign merchants the only money which can be exported is standard metallic money. Hence Gresham's law holds with regard to paper-money, which is, like light and debased coins, capable of driving out standard money. Examples of this are to be found in the suspension of specie payments by the Bank of England between 1797 and 1819, and in the history of the French assignats at the time of the Revolution. The various methods by which the issue of paper-money may be conducted are exceedingly numerous and a matter of interminable debate. The state may constitute itself the sole issuer of representative money on the same lines as it constitutes itself sole issuer of metallic money, or it may allow corporations, companies, or private individuals to issue representative money under legislative control.

The question as to the duty of a government in this respect has been much obscured by the want of a clear apprehension of the distinction between a real and a nominal currency. The doctrine of orthodox writers on the currency of the absolute convertibility of the bank-note, by which is intended a convertibility provided for by the action of government, is held by some writers to proceed on an altogether exaggerated and inaccurate notion of the functions of a government. Another idea, that the issue of paper-money ought to be wholly controlled by government, or ought to rest entirely upon government credit, places a high degree of faith in the trustworthiness of governments, and is held by many to misconceive the nature and objects of a paper currency. The tendency has been to regard the issue of notes not so much as allied to the commercial operation of drawing bills, but as analogous to the state function of coinage. In Scotland, on the other hand, a perfectly sound currency was furnished by banks acting, until 1845, on their own unrestricted discretion, and the prevailing tendency is still toward a maximum of freedom in the issue of representative paper-money.

Credit Currency.—Asset currency and credit currency are two things that mean the same thing. An asset or credit currency would, in this country, be the issue of notes by the national banks, these notes to be based upon the general assets of the banks, that is to say, their resources in specie and United States notes, their loans and discounts, their holdings of bonds and other securities, and their real estate, to which should be added their capital and surplus, and possibly the personal liabilities of the stockholders. Capital is usually called a liability by banks, though it is in reality an asset so far as the depositors are concerned. It is a liability of the bank only in its relations to its stockholders. Asset currency is, therefore, a currency based upon the credit of a bank as measured by its capital and resources, and its reputation for honest and efficient management. The present bank-note circulation of the United States is a bond-secured currency, and in a strict sense, might be termed a credit currency, for notes thus issued are promises to pay secured by bonds, which are promises to pay. But it is needless to say that the government's promise to pay is the highest form of security. So that neither it nor the bank-note is in practice credit currency.

The national banking system was an outgrowth of the Civil War, and at least one of the motives for securing note circulation by deposits of bonds was to insure a market for the bonds issued by the government to defray the cost of the Civil War. But, with the establishment of peace and the rapid development of the country in wealth and power, the credit of the nation has increased, and there is no longer any need of creating a market for government bonds, though, of course, if the law was changed so that they were no longer required to secure circulation and government deposits, their price would decline. But, the motive for a bond-secured circulation no longer exists. Our government could sell its bonds even if they were not required by the banks. The public debt, notwithstanding the bonds issued in the second Cleveland administration to keep the government on a gold basis, and those issued by the McKinley administration to defray the cost of the Cuban war, has been greatly reduced since the civil conflict. It is the settled policy of the treasury to reduce the public debt by at least $50,000,000 a year. But regardless of the motive for securing bank-note circulation by deposits of bonds, the result has been to create an absolutely safe currency. A national bank-note is always sure of redemption. The failure of a bank does not impair the security of its outstanding notes. These have behind them the power, the wealth, the credit of the whole country.

But, security is not the only essential of a currency. It must have another quality, namely, elasticity. The advocates of a credit currency claim that it would be as safe as a bond-secured circulation, and at the same time have the quality of elasticity which the present bank-note circulation has not. There are times when an expansion in note circulation is desired, as for instance, when the crops are being harvested and moved to the markets. But when this demand for currency is passed, the door should be open for a speedy retirement of bank-notes. Any note circulation in excess of actual needs would have the demoralizing effect of inflation. There must be every facility for quick expansion and equally quick contraction. The latter is fully

as important as the other. If necessary it might be made compulsory by making the tax upon circulation so large that the moment the demand for notes ceased it would be unprofitable for the banks to attempt to force them into circulation, and they would thus be reduced in lawful money and retired. It is scarcely necessary to say that a redeemable bank-note circulation absolutely sure, and perfectly elastic, so as to conform to the varying needs of the country, constitutes an ideal currency. One of its merits raising it, even above gold coin in actual use, is the economy and safety the bank-notes secure in transportation. They can be sent long distances with small expense, and are a most convenient form of money. Even if not made a legal tender in payment of debts they would be universally accepted for such a purpose because of the confidence felt in them. See BANKS AND BANKING; BILLS; COINAGE; DOLLARS; GOLD; MONEY.

Currency Bill of 1900 (15 February), the culmination of the many years' struggle between United States parties over the standard of value; ending in the complete victory of the gold party, 46 to 29 in the Senate on the adoption of the bill. The provisions are: The unit of value to be the gold dollar of 25.8 grains, 9-10 fine; all United States money to be maintained at a parity with it, and all government paper-money to be redeemable in gold. A redemption fund of $150,000,000 to be set apart not to fall below $100,000,000, and if necessary replenished by sale of bonds at not over 3 per cent. As fast as silver dollars are coined, an equal amount of treasury notes to be replaced by silver certificates; gold certificates on certain conditions to be issued against the gold in the treasury. No United States or treasury notes to be of less than $10, nor silver certificates of more than $10. The bonded debt may be refunded in 30-year 2 per cent gold bonds, at not less than par. Any national bank may issue circulating notes up to its paid-up capital, by depositing an equal amount of national bonds.

Current, a flow or stream of a body of water, more or less rapid, by which vessels are compelled to alter or modify their course or velocity, or both, according to the set or drift of the current. Rivers have currents varying in strength, chiefly according to the inclination of the bed down which they flow.

There are currents in the sea vastly broader than any existing even in the largest rivers, while the length is indefinite, for each is so connected with all the rest that the whole surface waters of the ocean resemble a very much curved and contorted chain, which, notwithstanding the excessive irregularity of its figure, so moves as perpetually to return into itself. In the Atlantic the chief currents were long held to be, first, the Gulf Stream, from the Gulf of Mexico in a northeast direction, a branch ultimately reaching the Azores and another the British Islands. This current was counterbalanced by a Polar one moving southwest and carrying escaped icebergs in the direction of America. The Gulf Stream was partly fed by the Equatorial current, running from the coast of Africa to the Caribbean Sea. Dr. Carpenter has shown that not merely the Gulf Stream, but a great part of the surface of the Atlantic, is moving north. An Antarctic drift current originates a great Equatorial current in the Pacific Ocean, which flows north around the west shores of South America, and then west through the Pacific, filling the entire tropics. Strong land currents sweep from it round east Australia, through the China seas, and by the coast of Japan.

The movement of currents from warmer or colder regions, or *vice versa*, modifies the temperature of the several regions through which they pass. Thus the Equatorial current which crosses from Africa to Brazil and the Caribbean Sea, being 3° or 4° cooler than the ocean at the equator, diminishes the heat at the latter region. The Gulf Stream, on the contrary, brings with it heat, the temperature of the Mexican Sea being 7° above that of the Atlantic in the same latitude. Among the causes of currents on a greater or less scale may be enumerated the winds, the tides, the evaporation produced by solar heat in certain places, and the expansion and contraction of water by heat and cold.

The technical language in which the flow of water and its channels are known and described is as follows: The bed is the water-course, having a bottom, and two sides or shores. When the latter are described as right- or left-hand, going down stream is assumed. The transverse section is a vertical plane at right angles to the course of the current. The perimeter is the length of this section in the bed. The longitudinal section or profile is a vertical plane parallel to the course of the flowing water. The slope or declivity is the mean angle of inclination of the surface of the water to the horizon. The fall is the difference in the height at any two points of determinate distance apart, as, for instance, eight inches to the mile. The line of current is the direction of maximum velocity. The mid-channel is the deepest part of the bed. The velocity is greater at the surface than at the bed. The surface is higher in the current than at the shore when the river is rising, lower than at shore when the river is falling. The direction is the set of the current; the rate is the drift of the current. For electric current, see ELECTRICITY.

Current River, a river of Missouri, rising among the Ozark Mountains in the southern central part of the State, flowing southeast and south into the Black River in Arkansas; length 250 miles. It is navigable for the greater part of its length.

Currents, Ocean, are phenomena of the highest importance in practical navigation. They are streams or rivers of the ocean, and, like the rivers of the land, accelerate or retard the course of the mariner according as the vessel's course is with or against the direction of the stream. With extended navigation of the most distant waters of the globe, increasing attention has naturally been bestowed on the subject of currents, with a view not merely to map down their various courses, but also to elucidate the causes to which they owe their origin. Their recognized influence upon the climates of maritime regions — an influence which extends far inland — gives them additional interest as belonging to the subject of physical geography, of which study, indeed, they constitute one of the most important chapters.

Of the various theories which have been framed with a view to account for the existence

of currents, the axial motion of the earth, and the varying densities of the sea under different parallels, have in nearly all cases formed a part. The theory of a circuit maintained between the equatorial and polar waters, due to their varying density, is distinctly stated by Lyell ('Principles of Geology') and by Maury ('Physical Geography of the Sea'). This theory has within a recent period engaged renewed attention, and has undoubtedly received additional strength from the interesting researches of Dr. Carpenter, who, with great ingenuity and by exceedingly simple means, has given experimental confirmation of its sufficiency as a vera causa. Other causes — among them the earth's axial movement from west to east, and the perennial winds of tropical latitudes, combined with the shape of the continents — also operate in the production of the ocean streams, and give special direction to their movements.

Sea water, unlike fresh water, which has its maximum density at a temperature of 39° or 40° F., continues to increase in density down to its freezing-point, about 25° F. The waters within two extensive areas of the globe, that is, the polar regions of either hemisphere, owing to their generally low temperature (which during a large portion of the year exhibits an intensity of cold of which it is difficult to realize an adequate conception, but of which the polar ice and the huge icebergs derived thence are the unfailing evidence), have a density many degrees in excess of that belonging to the waters of the tropical belt. This difference, though subject to some amount of seasonal modification, is yet permanent, since the brief summer heat of high latitudes penetrates but a little way below the surface, and can scarcely affect the mean temperature of the water at even a moderate depth. There is thus, in either hemisphere, an area within which the waters of the ocean are colder, and hence, by many degrees, denser than within the belt of the tropics. The natural result is a tendency of the colder and heavier water to sink, and to diffuse itself over the lower portion of the ocean-bed, and a movement of the warmer and lighter water in the direction of the surface, over which it tends to become diffused. In other words, the colder waters will move beneath the surface in the direction of the equator; and the warmer waters will flow along the surface in the direction of either pole. Hence, in either half of the globe, two great and opposite currents — a cold current flowing from the pole toward the equator, and a warm current flowing from the equator in the direction of the pole. The means by which Dr. Carpenter illustrates this natural movement on the part of fluids, or portions of the same fluid, of various densities, in contact with one another, and with free movement between their various parts, consists simply in placing at one end of a narrow trough of glass, filled with water, a lump of ice, and at the other end a bar of iron, heated by the flame of a spirit lamp. If a few drops of blue coloring liquid be introduced into the colder end of the vessel, and a like quantity of red-colored liquid similarly introduced into the other or warmth-receiving end, so as to render any movement of the water visible, it will be seen that a circuit is gradually produced. The colder and heavier water sinks to the bottom and spreads over it, the warmer and lighter water rises, and diffuses itself over the surface. A circuit or double current is thus formed, which lasts as long as the causes to which the difference of density is due are maintained in operation. This, on a small scale, is exactly what is maintained within the ocean bed of either hemisphere upon a large scale — the heated bar of metal representing the perennial warmth of tropical latitudes, and the lump of ice taking the place of the vast ice-fields and icebergs of polar waters. It is the intense cold by which the latter are occasioned that we must regard as, in the main, the originating cause of currents, though other influences, some of them of high importance, require to be taken into account. Among the latter, the influence exerted by the axial rotation of the globe takes the first place.

The axial rotation of the earth is an eastwardly motion. In virtue of it, everything on the surface of the globe is constantly moving to the eastward. The maximum rapidity of this motion is of course found under the equator, a circle which measures 25,000 miles, and the complete rotation of which within 24 hours is equivalent, in the case of any particular spot, to a rate of above 1,000 miles an hour. The actual rate of eastwardly motion becomes continually diminished with the diminishing magnitude of the successive parallels of latitude. Under the parallel of 60°, for example, a circle of only 12,000 miles, or half the measure of the equator, is carried round within the same period of 24 hours — giving to any particular spot on it a rate of only 500 miles per hour. At the pole itself axial motion vanishes. But persistence in motion is a well-known law of nature. Velocity of motion in any given direction is only gradually lost, as any increase in its amount is capable only of gradual acquisition. The maximum of eastwardly tendency proper to the waters of tropical seas is maintained, or but gradually lessened, in the course of their advance in the direction of the pole, and the result must be, in the case of the northern hemisphere, a northeastwardly direction; in the southern half of the globe, a southeastwardly direction. That is, the movement of tropical waters toward the pole, which, were the earth at rest, would be a movement, in the one hemisphere, from south to north, in the other from north to south, is deflected to the eastward of the meridian. In other words, the warm current which advances from the tropical belt in the direction of the pole only gradually loses its excess of eastwardly motion; hence, deflected to the eastward of the meridian, it becomes in the northern hemisphere a northeastwardly current, and as such is directed toward the western shores of Europe, and to the western shores of the New World within similar latitudes. In the southern hemisphere the like condition produces a southeastwardly current, instead of one flowing due south.

Under the operation of the same laws the streams that set out from polar latitudes in the direction of the equator, failing to acquire, or only gradually acquiring, the increasing rate of axial or eastwardly motion which belongs to the lower parallels toward which they are advancing, continually fall to the westward of the meridian. The actual direction of their movement is hence, in the northern hemisphere, to the westward of south — that is, the polar current becomes a southwesterly current, and meets the easterly shores of the continent toward which it is directed — the shores, namely,

of eastern Asia and the eastern side of the American continent. In the southern hemisphere the correspondent stream becomes a northwesterly instead of a northerly current. Proof that such is the actual direction of the great ocean streams is afforded by the fact of the productions of the torrid zone (tropical fruits, etc.) being continually thrown upon the coasts of western Europe, and by the vast icebergs — the produce of glaciers which overhang the waters of Baffin Bay and the Greenland Sea — carried toward the Atlantic coasts of the New World. The deep-sea currents of either ocean may thus, with great probability, be traced to an origin in polar or tropical waters respectively, and are to be classed under the head of cold or warm current accordingly. But the varying depths of the ocean-bed, and yet more the shapes of the land, materially modify, in many cases, the direction of their streams.

A distinction, however, must be drawn between deep-sea currents and surface or drift currents. It is probable that the latter owe their origin chiefly, if not wholly, to the action of the winds, which, within certain well-defined areas, are either perennial or seasonal. The belts of the Atlantic and Pacific over which the trade-winds blow are also those within which the westward-going or equatorial currents of those oceans are experienced. It is to the constant drift of surface-water to the westward, under the influence of the trade-wind, that the Equatorial Current of the Atlantic, and the similar Equatorial Current of the Pacific Ocean, are due. Within that portion of the Indian Ocean over which a perennial wind, correspondent in direction to the trade-winds of the Atlantic and Pacific, is experienced, that is, to the southward of the parallel of 5° or 6° south latitude, a like westward-setting current is found. In the northwardly half of the same basin — that is, within the monsoon-area of the Indian Ocean, and also within the like area of the China and adjacent seas — the currents undergo a like change of direction to the monsoons themselves.

The equatorial currents, with the counter-streams to which, under the influence of obstructions presented by the land, they give origin, are among the most important phenomena of the globe's surface. In the case of the Atlantic Ocean, the western limit of which is formed by a continuous mainland, unbroken through 110° of the meridian (from the entrance of Hudson Bay to the Strait of Magellan), or upward of 7,000 miles, the obstacle to further westwardly progress of the intra-tropical waters gives origin, there can be little doubt, to the Gulf Stream within its northwardly half, and to the Brazil current under its more southern parallels. The westward moving waters, encountering the eastward extension of the South American mainland, become of necessity divided into two streams, the one of which sets to the southward along the eastern coasts of Brazil, while the other advances along the more northwardly portions of the South American terra firma, past the outlets of the Amazons and the Orinoco, and thence into the Caribbean Sea. From the latter land-enclosed basin its course is necessarily into the similarly shut-in basin of the Mexican Gulf, whence it finally emerges through the narrow channel of Florida as the well known Gulf Stream. The origin thus attributed to this famous current is in harmony with recognized laws relating to the movement of fluids acted on by a persistent force (such as the trade-winds supply), and under the influence of any opposing obstacle to farther advance in a given direction. In the case of the Pacific Ocean there exists no such complete obstruction to the westwardly progress of the equatorial waters, since the islands of the Malay Archipelago take the place which within correspondent parallels of the Atlantic is occupied by an unbroken line of coast. A portion of its equatorial stream, however, is deflected to the northward toward the coasts of Japan (where it forms the well-known Japan Stream, setting to the northeastward, past the Kuriles, in the direction of the Aleutian Islands), while another portion turns southwardly in the direction of Australia and New Zealand. In like manner, that portion of the Indian Ocean where alone a westwardly motion is constant — that is, the southern half of its basin — gives origin to a stream which, setting along the eastern shores of Madagascar and past the entrance of the Mozambique Channel, forms the initial portion of the Lagullas or Agulhas current. This latter sets in part round the headland whence its name is derived, carrying some of the waters of the Indian Ocean into the Atlantic; but a large portion of its waters (probably the larger), deflected by the extensive submarine elevation of the Agulhas Bank, returns into the Indian Ocean, forming part of a general eastwardly drift, within higher latitudes, in the direction of Australia.

Geographers were long led to entertain (and some still entertain) what seems to us a very exaggerated estimate of the results due to the one of them to which reference is most frequently made, namely, the «Gulf Stream.» Recent observation and measurement have materially diminished this estimate. As a local current, however, the Gulf Stream is undoubtedly of high importance, and within certain limits it is one of the most powerful of currents. The initial portion of its stream has been already traced. From its issue through the Florida Channel the course of the Gulf Stream is to the north and eastward, in a direction parallel to the coast-line of the United States, past Cape Hatteras (lat. 35° 13′), and along the southern edge of the «great banks» of Nantucket and Newfoundland (between the meridians of 48° and 60° west of Greenwich), beyond which its existence as a distinct current cannot be traced, the farther course of its waters being absorbed in the general northeastwardly movement of the Atlantic, as described above.

Throughout the earlier portion of its course, and especially within its narrowest section, between the mainland of Florida and the little group of the Bemini Islands (lat. 25° 40′; lon. 75° 15′), the Gulf Stream constitutes a well-defined channel, the water of which is distinguished from that of the ocean upon either side, alike by its higher temperature and by its deep blue color. The difference of temperature is more marked by comparison with the coast-water — that is, the channel lying between the Gulf Stream itself and the shore line of the United States — than with the open sea to the eastward of its course; a consequence of the fact that a belt of cold water, derived from

the Polar or Baffin Bay current, and setting in the opposite direction to the Gulf Stream itself, flows side by side with the warmer current immediately along the mainland. The difference of temperature between the water of the Gulf Stream and that of the adjacent cold current on its inland side amounts at some seasons to as much as 20° (or even 30°) F. This maximum difference of temperature, however, is perceptibly lessened after the current has passed the parallel of Cape Hatteras, and is gradually diminished in its farther course to the northeastward. The warm waters of the Gulf Stream and the cold waters of the Greenland or Baffin Bay current, interlace off the "great bank" of Newfoundland, before reaching which the former has already so greatly diminished in depth as to have again become, what we regard it as having been in its origin, a mere surface-drift.

The velocity of the Gulf Stream is naturally greatest within the earlier and narrower portion of its course, that is, within the Strait of Florida, where it is equivalent to a mean of about 65 miles per day. This diminishes to 56 miles off Charleston, 36 to 46 miles off Nantucket, and 28 miles to the south of the Newfoundland Banks. The high temperature of its waters, even within its narrower and more strongly marked portion, is not maintained to the bottom of its channel, but is proved to give place at less than half its total depth to a much lower temperature. The observed temperature of the sea at the bottom of Florida Channel — that is, within the most powerful portion of the Gulf Stream — is only 34°, while the surface temperature varies between 80° and 84°! So greatly has popular belief, based upon scientific theories formed in the absence of observation, exaggerated the distinguishing conditions of this famous current. The Gulf Stream is undoubtedly of great importance as a local current, and plays its part in the general circuit of the North Atlantic waters. A general surface-drift to the eastward, in the direction of the African continent, is traceable between the parallels of 30° and 35°, its limits undergoing some variation with the seasons. This constitutes a return or counter movement to the westwardly drift of the equatorial Atlantic, and, combined with a southwardly set of the waters off the western coast of Africa, involves a general circuit of waters round a vast area of the North Atlantic Ocean, within which area are found the masses of floating weed known as the sargasso or gulf-weed. As to the supposed direct influence of the Gulf Stream upon the climate of western Europe, it may, we conceive, be safely dismissed as belonging to the realm of fancy. Indirectly, the warmth-giving influence of this famous current, such as it is, harmonizes with the more extended results due to the general set of the tropical waters in the direction of Europe. But the supposition that a narrow (and at the same time shallow) current, such as the Gulf Stream is proved, by direct observation, to be, can impart any appreciable warmth to the shores of western and northwestern Europe — nay, even (as the advocates of such a theory insist to be the case) to the waters that wash the shores of Nova Zembla and the Arctic coasts of Europe and Asia, and that after a course of some thousands of miles across an open expanse of ocean — seems to us quite at variance with probability, besides its inconsistency with known laws respecting the temperature of fluids in motion. The few degrees of superior heat that belong to the Gulf Stream after it has passed Cape Hatteras must be lost long before the mid-ocean is reached.

In the attempt to frame a theory which accounts satisfactorily for the existence and general movements of ocean currents, the many local conditions which affect particular parts of the sea can receive but the briefest reference. Tidal currents, due to the local ebb and flow, as experienced in narrow seas, are of distinct origin. See OCEAN.

Cur'rie, Lady Mary Montgomerie Lamb Singleton ("VIOLET FANE"), English poet and miscellaneous writer. She was married in 1864 to Henry Sydenham Singleton, who died in 1893, and in 1894 to the 1st Baron Currie. Her books, published under the pseudonym of "Violet Fane," are: 'From Dawn to Noon' (1872); 'Denzil Place' (1875); 'The Queen of the Fairies' (1877); 'The Edwin and Angelina Papers' (1878); 'Collected Verses' (1880); 'Sophy, or the Adventures of a Savage' (1881); 'Thro' Love and War' (1886); 'Autumn Songs' (1889); 'The Story of Helen Davenant' (1889); 'Memoirs of Marguerite de Valois, Queen of Navarre' (1892); 'Under Cross and Crescent' (1896); 'Betwixt the Seas' (1899); 'Two Moods of a Man' (1901); 'Constance's Fate.'

Cur'rier, Charles Warren, American Roman Catholic clergyman: b. St. Thomas, West Indies, 22 March 1857. He studied in Holland chiefly philosophy and theology 1871–80; was ordained in 1880; lived in Surinam as a missionary 1881–2; and became pastor of St. Mary's, Washington, D. C., 1900. His published works are: 'Carmel in America' (1890); 'History of Religious Orders' (1894); 'Church and Saints' (1897); 'The Divinity of Christ' (1898); 'The Mass' (1899); and several historical romances.

Curry, Daniel, American Methodist clergyman: b. near Peekskill, N. Y., 26 Nov. 1809; d. New York 17 Aug. 1887. He was graduated at Wesleyan University in 1837, and after holding various pastorates and professorships, was chosen president of Indiana Asbury University in 1854. Ten years later he became editor of 'The Christian Advocate,' and in 1884 editor of the 'Quarterly Review.' He published 'Life of Wiclif' (1846); 'Platform Papers' (1880), etc.

Curry, Jabez Lamar Monroe, American educator and diplomat: b. Lincoln County, Ga., 5 June 1825; d. Asheville, N. C., 12 Feb. 1903. He was graduated at the University of Georgia in 1843 and at Harvard Law School in 1845. He became a Baptist minister, served in the Confederate army; was president of Howard College 1866–8; and in 1881 was appointed general agent of the Peabody Educational Fund and later also of the Slater Educational Funds. He was minister to Spain 1885–9, and special ambassador from the United States at the coronation of King Alfonso XIII. of Spain, 17 May 1902. He published: 'Constitutional Government in Spain' (1889); 'William Ewart Gladstone: a Study' (1891).

Curry, Samuel Silas, American educator: b. Chatata, Tenn., 1847. He was graduated at

Grant University 1872; has attained a wide reputation as a teacher of oratory and elocution, and has been connected in a teaching capacity with Boston University, Newton Theological Seminary, Harvard Divinity School, and the Yale Divinity School. He founded and is the head of a school of expression in Boston, Mass. His publications are: 'Province of Expression' (1891); 'Lessons in Vocal Expression' (1895); 'Imagination and Dramatic Instinct' (1896).

Cursores, kėr'sō-rēz, or **Runners,** an order of birds, which includes the ostrich, rhea, emu, cassowary, and apteryx. The birds of this order are distinguished by the rudimentary character of their wings, which are too short to be of use for flight, and by the length and strength of their legs. The breastbone is destitute of the ridge or keel which it possesses in most birds. The hind toe is wanting in all except the apteryx, in which it is rudimentary; the anterior toes are two or three in number. The barbs of the feathers are disconnected, and present a considerable resemblance to hairs. The order has been divided into the two families — *Struthionidæ* and *Apterygidæ,* the latter of which includes only the apteryx of New Zeland.

Curtin, Andrew Gregg, American politician: b. Bellefonte, Pa., 22 April 1815; d. there 7 Oct. 1894. He studied law at Dickinson College, and was admitted to the bar in 1839. Entering politics, he became secretary of the commonwealth of Pennsylvania in 1854, governor in 1860, and again in 1863, being one of the most noted "war governors" of the Civil War period. In 1869 he was appointed minister to Russia. In 1873 he left the Republican party, and from 1881 to 1887 sat in Congress as a Democrat.

Curtin, Jeremiah, American linguist and antiquarian: b. Milwaukee, Wis., 1838; d. Burlington, Vt., 14 Dec. 1906. He wrote: 'Myths and Folklore of Ireland'; 'Tales of the Fairies and the Ghost World'; 'Myths and Folk-Tales of the Russians, Western Slavs, and Magyars'; 'Hero Tales of Ireland'; etc. He has translated much from Russian and Polish, and is widely known by his translations of the novels of Sienkiewicz.

Curtis, Alfred A., American Roman Catholic prelate: b. Somerset county, Md., 4 July 1831. When only 21 years old he was ordained in the Episcopal ministry and for several years labored on Eastern Shore and later in Baltimore, and Western Maryland, finally returning to Baltimore. Later he resigned his ministerial duties, entered the Catholic Church, took a theological course of two and a half years, was ordained priest by Archbishop Bayley, 17 Dec. 1874 and stationed at Baltimore Cathedral till 14 Nov. 1886, when he was consecrated Bishop of Wilmington, Delaware.

Curtis, Benjamin Robbins, American jurist: b. Watertown, Mass., 4 Nov. 1809; d. Newport, R. I., 15 Sept. 1874. He was graduated at Harvard 1829; was admitted to the bar 1832, and rose rapidly to the height of his profession in Boston, Mass. He was appointed to the United States Supreme Court 1851, and in the famous Dred Scott case made a powerful argument dissenting from the court's decision. Resigning in 1857 he was a member of the State legislature for two years; and in 1868 one of the counsel for the defense in the impeachment trial of Andrew Johnson. His writings include: 'Reports of Cases in the Circuit Courts of the United States' (1854); 'Decisions of the Supreme Court of the United States, with notes and a digest'; 'Jurisdiction, Practice, and Peculiar Jurisdiction of the Courts of the United States' (1880). Consult 'Memoir and Writings' (1880).

Curtis, Edward, American medical scientist: b. Providence, R. I., 4 June 1838. He is a brother of G. W. Curtis (q.v.). He was graduated at Harvard in 1859, and took his medical degree at the University of Pennsylvania in 1864. He was an army surgeon during the Civil War and since 1866 has been a member of the faculty of the College of Physicians and Surgeons in New York. He has made a specialty of microscopic study and the camera in connection with diagnosis, and has published a 'Manual of General Medicinal Technology' (1883).

Curtis, George Ticknor, American lawyer: b. Watertown, Mass., 28 Nov. 1812; d. New York 28 March 1894. He was a brother of B. R. Curtis (q.v.). In addition to his eminence at the New York bar he was noted as the author of an authoritative 'History of the Constitution of the United States.' He published likewise: 'Digest of English and American Admiralty Decisions'; 'American Conveyancer'; 'Life of James Buchanan'; 'Life of Daniel Webster'; 'Creation or Evolution'; and 'John Charaxes,' a novel.

Curtis, George William, American essayist and journalist: b. Providence, R. I., 24 Feb. 1824; d. New Brighton, Staten Island, N. Y., 31 Aug. 1892. At 18 he spent some months at Brook Farm (q.v.) and a few years later visited the Old World, the results of his travels appearing in 'Nile Notes of a Howadji' (1851); and 'The Howadji in Syria' (1852). He was an early sympathizer with the abolition movement and as the editor of 'Harper's Weekly' for nearly a generation, exercised a measurable influence over the more thoughtful of his countrymen. At an earlier period he was editor of 'Putnam's Magazine,' which did not prove a financial success, and for many years thereafter he devoted the proceeds of his lecture tours to paying off the obligations incurred in relation to that enterprise. From 1854, till not long before his death, he edited the "Easy Chair" department of 'Harper's Magazine,' and it is by his "Easy Chair" essays that he is likely to be longest remembered. In these are displayed a gentle persuasiveness of argument, and a fund of humor which made them very attractive reading, while the style was at all times polished and graceful. In them he touched upon the varied topics of the day, the lighter as well as the more serious, and since his death several small volumes of selections from them have been published. He was one of the leaders of the Republican party at its outset and in his later years was conspicuous as an advocate of civil service reform and of independent action in politics. As a lecturer and orator he was

very popular, and several of his political speeches and orations upon special occasions take high rank among specimens of American oratory. Beside the volumes already named he published: 'Lotus Eating' (1852); 'The Potiphar Papers' (1853); 'Prue and I' (1856); 'Trumps' (1862). These are more or less ephemeral in their nature, 'Prue and I' being the only work among them which interests the present generation. His 'Orations and Addresses,' edited by C. E. Norton, appeared (1893–4). Consult Cary, 'George William Curtis' (1894).

Curtis, Mattoon Monroe, American educator: b. Rome, N. Y., 19 Oct. 1858. He was graduated at Hamilton College, N. Y., 1880, and from the Union Theological Seminary 1883. He was pastor of a Presbyterian church at Cleveland, Ohio, 1885–8, and in 1891 was elected Handy professor of philosophy in the Western Reserve University. He has published: 'Locke's Ethics'; 'Philosophy and Physical Science'; 'Philosophy in America'; etc.

Curtis, Samuel Ryan, American soldier: b. near Champlain, N. Y., 3 Feb. 1807; d. Council Bluffs, Iowa, 26 Dec. 1866. He was graduated at West Point 1831; served as colonel in the Mexican war, and was a Republican congressman from his State 1857–61. He was commissioned a brigadier-general 17 May 1861; defeated Gens. Price and McCulloch in a decisive engagement at Pea Ridge, Ark., and was promoted major-general 21 March 1862.

Curtis, William Eleroy, American journalist: b. Akron, Ohio, 5 Nov. 1850. He has written: 'Children of the Sun' (1882); 'Capitals of Spanish America' (1888); 'The Land of the Nihilist' (1888); 'Japan Sketches'; 'Venezuela' (1891); 'Life of Zachariah Chandler'; 'The Yankees of the East' (1896); 'To-day in France and Germany' (1897); 'Between the Andes and the Ocean' (1900); etc. He was director of the Bureau of American Republics 1890–3, and chief of the Latin-American department and historical section of the World's Columbian Exposition 1891–3.

Curtiss, Samuel Ives, American Congregational clergyman: b. Union, Conn., 5 Feb. 1844; d. London, Eng., 22 Sept. 1904. He was graduated at Amherst College 1867, and the Union Theological Seminary 1870; and was pastor of the American chapel in Leipsic 1874–8. In 1878 he was appointed professor of biblical literature in Chicago Theological Seminary, but changed later to the chair of Old Testament literature and interpretation. His publications include: A translation of Bickell's 'Outlines of Hebrew Grammar' (1877); 'The Levitical Priests' (1877); translations of Delitzsch's 'Old Testament History of Redemption' (1881); 'Franz Delitzsch' (1890); 'Ezekiel and His Times' (in 'The Bible as Literature' 1896); etc.

Curtius, koor'tsē-oos, **Ernst,** German Hellenist: b. Lübeck 2 Sept. 1814; d. Berlin 12 July 1896. He was educated at Göttingen, Bonn, and Berlin, and in 1856 succeeded Hermann as professor at Göttingen, and in 1868 was called to Berlin University. He made several journeys to places of archæological interest in Greece and Asia Minor. Of his works, which mostly relate to Greek antiquities, the best known is his 'History of Greece' (1857–61), translated into English by A. W. Ward (1868–73). Other works by him are: 'De Portibus Athenarum' (1842); 'Klassische Studien' (1840); 'Inscriptiones Atticæ XII.' (1848); 'Olympia' (1852); 'Die Ionier' (1855); 'Peloponnesos' (1851–2).

Curtius, Georg, gā'ōrg, German philologist: b. Lübeck 16 April 1820; d. Hermsdorf 12 Aug. 1885. He was a brother of Ernst Curtius (q.v.), and in 1849 went to Prague as professor of classical philology, removing five years later to the corresponding chair at Kiel. In 1861 he became professor in Leipsic University, and held this post till his death. His earliest work was 'De Nominum Græcorum Formatione' (1842); and among many important later ones are: 'Grundzüge der Griechischen Etymologie' (1858–62), his *chef d'œuvre* translated into English by Wilkins and England; 'Zur Chronologie der Indogermanischen Sprachforschung' (1867); 'Das Verbum der Griechischen Sprache' (1873 and 1876); and Griechische Schulgrammatik' (1852), the last two having been translated for English students.

Curtius, kėr'shĭ-ŭs, **Marcus,** Roman legendary hero, who, according to tradition, sacrificed himself for the good of his country. In 362 B.C. it is said a chasm opened in the Roman forum, from which issued pestilential vapors. The oracle declared that the chasm would close whenever that which constituted the glory of Rome should be thrown into it. Curtius asked if anything in Rome was more precious than arms and valor; and being answered in the negative, arrayed himself in armor, mounted a horse splendidly equipped, solemnly devoted himself to death in presence of the Roman people, and sprang into the abyss, which instantly closed over him. The lacus Curtius, which marked the spot, has been discovered by the modern archæologist.

Curtius, Rufus Quintus, Roman historian. He wrote the history of Alexander the Great in 10 books, the first two of which are lost. The exact period in which he flourished is not known; for though his style would indicate that he lived in one of the best periods of the Latin language, no writer of any earlier date than the 12th century has made any mention of his work.

Curtius, Theodor, tā'ō-dōr koor'tsē-oos, German chemist: b. Duisberg 27 May 1857. He studied at Leipsic, Heidelberg, and Munich; in 1886 was lecturer at the University of Erlangen; in 1889 became professor of chemistry at Kiel, and in 1897 at the University of Heidelberg. He investigated the diazo- compounds of the fats, and discovered hydrazine and hydrazoic acid, both compounds of nitrogen.

Curule Magistrates were the highest dignitaries of the Roman state, and distinguished from all others by enjoying the privilege of sitting on ivory chairs (*sellæ curules*) when engaged in their public functions. The curule magistrates were the consuls, prætors, censors, and chief ædiles, who, to distinguish them from the plebeian ædiles, were called curule.

Curves of Double Curvature. (In French, *courbes gauches;* in German, *Curven doppelter Krummung.*) A curve whose points do not all lie in a plane is variously called space curve, twisted curve, tortuous curve, or curve of double curvature. The significance of the last-named designation becomes apparent in the description of the elements which enter the theory of the curve

There are two ways of regarding the curve: first, as given immediately and in all its extent by the intersection of two surfaces—a purely geometric conception; second, as arising kinematically through the continuous movement of a point. The first conception leads to the analytical formulation of a curve as the locus of points whose Cartesian coördinates satisfy two equations, the equations of the intersecting surfaces

$$(1) \qquad f_1(x, y, z) = 0, \quad f_2(x, y, z) = 0.$$

The second conception leads to the expression of the Cartesian coördinates x, y, z as functions of a variable magnitude u called the parameter:

$$(2) \qquad x = \phi(u), \quad y = \chi(u), \quad z = \psi(u),$$

a form of representation called the parametric representation of the curve. To the continuous succession of values of u corresponds the continuous succession of points of the curve.

It is known that not every curve in space is the complete intersection of two surfaces, and therefore (1) and (2) are not always equivalent forms. In fact, when the three equations (2), defining a curve, are transformed to the two equations (1), the latter often furnish curve branches in addition to the original curve. The parametric representation is, in many important respects, preferable to the first form, and such equations and formulas as are hereafter used will have reference to this form.

The subject-matter may be conveniently divided into four parts: first, the determining elements of an infinitely small portion of the curve in the neighborhood of any point P of the curve; second, the character of the curve as a whole, and the associated curves and surfaces; third, special curves and their derivation from given properties; fourth, classification, miscellaneous points, and the literature of the subject.

1. *The Elements of the Curve at a Point.*—The consideration of two points, of three points, and of four points of the curve conducts immediately to fundamental elements.

The *tangent* at P is the limiting position assumed by the right line through P and a neighboring point P_1 of the curve as P_1 moves along the curve toward coincidence with P. It is convenient to say that the tangent at P is the right line through P and P_1, P_1 being infinitely near or consecutive to P.

The single infinity of lines through P perpendicular to the tangent are *normals* to the curve and define the *normal plane* of the curve at P. Every plane through the tangent is a tangent plane at P. A plane passing through P and two neighboring points of the curve assumes in general a limiting position at P as the two neighboring points move along the curve toward coincidence with P. This is the *plane of osculation* at P and may be described as the plane determined by three consecutive points P, P_1, P_2. It is the tangent plane at P which has the closest contact with the curve.

The plane through the tangent perpendicular to the plane of osculation is called the *plane of rectification* at P. The normal plane, the plane of osculation, and the plane of rectification are mutually at right angles and constitute the principal planes of the curve at P. Their intersections are three lines through P: the *tangent*, which is the intersection of the plane of osculation and the plane of rectification; the *principal normal*, which is the intersection of the normal plane and the plane of osculation; the *binormal*, the intersection of the normal plane and the plane of rectification. The three lines form a configuration called the *principal triedral* at P.

Of importance in the theory is the *circle of curvature*, namely, the limit circle defined by the fixed point P and two variable points P_1, P_2 as the variable points move along the curve toward coincidence with P. It is referred to as the circle through three consecutive points P, P_1, P_2 and obviously lies in the plane of osculation at P. Its center, radius, and the reciprocal of the radius are called respectively the *center of curvature*, the *radius of curvature*, and the *curvature of the curve* at P. Relative to the name, curve of double curvature, the curvature here described is properly first curvature, but it is customary to omit the word 'first'. The second curvature, to be noted shortly, is usually referred to as *torsion*.

Four points not in a plane determine one sphere. Through P and three variable points of the curve a sphere may be passed, which, when the variable points come into coincidence with P, becomes the *sphere of osculation* at P. It will be subsequently seen that its center and the center of first curvature are on a line parallel to the binormal at P.

The further development of the theory will employ the methods of the differential geometry in preference to limit processes. The elements already defined, when taken in pairs, give rise to new elements. The normal planes at the consecutive points P and P_1 intersect in a line passing through the center of curvature of P and parallel to the binormal of P. It is called the *axis of curvature* of the curve at P. The planes of rectification at P, P_1 intersect in the *line of rectification* at P. This line passes through P, makes an angle with the binormal of P, and is perpendicular to the principal normals of P and P_1. The planes of osculation at P, P_1 intersect in the tangent of the curve. The principal normals at P and P_1 do not intersect, nor do the binormals of P and P_1. The consecutive tangents do intersect in a point of the curve.

The Two Curvatures, or Curvature and Torsion.—As a point moves on the curve, the tangent continually changes its direction, as does also the plane of osculation: the first marks the tendency of the curve to depart from a right line, and the second the tendency to depart from a plane. Measures of these tendencies at a point P are defined as follows: If PP_1 be an infinitely small arc of length ds, and $d\epsilon$ the infinitely small angle between the tangents at P and P_1; and $d\tau$ the infinitely small angle between the planes of osculation at P and P_1, or, what is the same thing, the angle between the binormals of P and P_1; then the ratio $\frac{d\epsilon}{ds}$ is called the *curvature of the curve at* P, and the ratio $\frac{d\tau}{ds}$ is called the *torsion of the curve at* P. The angles $d\epsilon$ and $d\tau$ are called respectively *angle of contingence*, and *angle of torsion*, at P. This point of view of curvature leads at once to the circle of curvature previously described. The

ratio $\frac{d\varepsilon}{ds}$ has the same value for the curve and the circle at P, and if R designates the radius of the circle, there results *curvature at a point* $=\frac{1}{R}=\frac{d\varepsilon}{ds}$. On the other hand, there is no circle of torsion connected with the curve, and it is only by analogy that the term *radius of torsion*, T, is defined to be the reciprocal of the torsion. Expressed in equational form, *torsion at a point* $=\frac{1}{T}=\frac{d\tau}{ds}$.

A third curvature is sometimes regarded, but merely as a convenience. It is the ratio of the infinitely small angle $d\kappa$ between the principal normals at P and P_1 to the arc ds. It is in a sense the resultant of the other two curvatures, and has received the name of *entire curvature*. The angle $d\kappa$ is called the *angle of entire curvature*. Entire curvature is not an independent curvature, for, as will shortly be seen, its angle $d\kappa$ is a function of the other two through the equation $d\kappa^2=d\varepsilon^2+d\tau^2$.

Before clothing the foregoing definitions in analytical garb, it is necessary to adopt conventions as to the signs of directions, and to complete the notation. Of the two directions on a curve, that is taken as positive which corresponds to increasing values of u. The positive direction of the tangent is taken to coincide with the positive direction of the curve, and the direction cosines of the angles the positive tangent makes with the positive directions of the coördinate axes x, y, z are designated by $\alpha_1, \beta_1, \gamma_1$, respectively. The positive direction of the principal normal is the direction from P toward the center of curvature, and its direction cosines are designated by $\alpha_2, \beta_2, \gamma_2$. The positive direction of the binormal is so taken that it is directed with respect to the positive tangent and positive principal normal as the positive z axis is directed to the positive x axis and positive y axis. Its direction cosines are represented by $\alpha_3, \beta_3, \gamma_3$.

A table conveniently exhibits these relations:

	x	y	z
Tangent	α_1	β_1	γ_1
Principal normal	α_2	β_2	γ_2
Binormal	α_3	β_3	γ_3

In the elements of solid analytic geometry, it is shown that the determinant of the nine direction cosines equals 1, *i.e.*, $\begin{vmatrix}\alpha_1 & \beta_1 & \gamma_1\\ \alpha_2 & \beta_2 & \gamma_2\\ \alpha_3 & \beta_3 & \gamma_3\end{vmatrix}=1$, and that each constituent is equal to its cofactor. For example, $\alpha_2=\gamma_1\beta_3-\gamma_3\beta_1$. It is also a theorem of the elements of analytic geometry of space, that if a straight line varies its direction infinitely little, say by an angle dw, and if l, m, n are the direction cosines of the first position, and $l+dl, m+dm, n+dn$ are the direction cosines of the second position, that $dw^2=dl^2+dm^2+dn^2$. It has immediate application in the two curvatures.

Taking over from the calculus the value of ds^2 and differentiating,

$$(3)\qquad \begin{aligned} ds^2&=dx^2+dy^2+dz^2,\\ ds\,d^2s&=dx\,d^2x+dy\,d^2y+dz\,d^2z.\end{aligned}$$

The analytical side of the foregoing development is now easily formulated. All equations which follow and which contain the variables x, y, z and their differentials $dx, dy, dz, d^2x, d^2y, d^2z, ds, d^2s$ may be expressed in terms of the parameter u and its differential du by means of equations (2), the equations resulting from their differentiation, and equations (3).

One has immediately from the definitions of the elements at the point $P(x, y, z; u)$

$$(4)\qquad \alpha_1=\frac{dx}{ds},\quad \beta_1=\frac{dy}{ds},\quad \gamma_1=\frac{dz}{ds};$$

hence, for the equations of the tangent,

$$(5)\qquad \frac{\xi-x}{dx}=\frac{\eta-y}{dy}=\frac{\zeta-z}{dz},$$

and for the normal plane,

$$(6)\qquad (\xi-x)dx+(\eta-y)dy+(\zeta-z)dz=0.$$

The symbols ξ, η, ζ represent here and subsequently the current coördinates of the points of line, plane, etc.

In determining the constants L, M, N, Q so that the plane $L\xi+M\eta+N\zeta+Q=0$ passes through the point x, y, z, and the infinitely near points $x+dx, y+dy, z+dz$, and $x+2dx+d^2x$, $y+2dy+d^2y$, $z+2dz+d^2z$, one obtains

$$\begin{aligned}(\xi-x)(dy\,d^2z-dz\,d^2y)+(\eta-y)(dz\,d^2x-dx\,d^2z)\\ +(\zeta-z)(dx\,d^2y-dy\,d^2x)=0,\end{aligned}$$

or, in putting for convenience

$$(7)\qquad \begin{aligned} A&=dy\,d^2z-dz\,d^2y,\quad B=dz\,d^2x-dx\,d^2z,\\ C&=dx\,d^2y-dy\,d^2x,\end{aligned}$$

the equation of the plane of osculation in the form

$$(8)\qquad A(\xi-x)+B(\eta-y)+C(\zeta-z)=0.$$

This at once gives

$$(9)\qquad \alpha_3=\frac{A}{\sqrt{A^2+B^2+C^2}},\quad \beta_3=\frac{B}{\sqrt{A_2+B_2+C^2}},$$

$$\gamma_3=\frac{C}{\sqrt{A^2+B^2+C^2}};$$

and for the equations of the binormal

$$(10)\qquad \frac{\xi-x}{A}=\frac{\eta-y}{B}=\frac{\zeta-z}{C}.$$

From the determinant of the direction cosines one has

$$(11')\qquad \begin{aligned}\alpha_2&=\gamma_1\beta_3-\gamma_3\beta_1,\quad \beta_2=\alpha_1\gamma_3-\alpha_3\gamma_1,\\ \gamma_2&=\beta_1\alpha_3-\beta_3\alpha_1,\end{aligned}$$

and hence, by virtue of (4) and (9),

$$(11)\qquad \alpha_2=\frac{Bdz-Cdy}{ds\sqrt{A^2+B^2+C^2}},\quad \beta_2=\frac{Cdx-Adz}{ds\sqrt{A^2+B^2+C^2}},$$

$$\gamma_2=\frac{Ady-Bdx}{ds\sqrt{A^2+B^2+C^2}}.$$

The equation of the plane of rectification is

$$(12) \qquad (\xi-x)\alpha_2+(\eta-y)\beta_2+(\zeta-z)\gamma_2=0,$$

and the equations of the principal normal are

$$(13) \qquad \frac{\xi-x}{\alpha_2}=\frac{\eta-y}{\beta_2}=\frac{\zeta-z}{\gamma_2}.$$

Applying to curvature the theorem relative to the infinitely small change in direction of a right line, one has $d\varepsilon^2=d\alpha_1^2+d\beta_1^2+d\gamma_1^2$, whence, in differentiating (4) and employing (3) in the reduction,

$$(14) \quad (\text{curvature})^2=\frac{1}{R^2}=\frac{d\varepsilon^2}{ds^2}=\frac{A^2+B^2+C^2}{ds^6},$$

and also

$$(15) \quad d\alpha_1=\frac{Bdz-Cdy}{ds^3}, \quad d\beta_1=\frac{Cdx-Adz}{ds^3},$$

$$d\gamma_1=\frac{Ady-Bdx}{ds^3}.$$

A comparison of (11), (14), and (15) gives

$$(16) \qquad \alpha_2=R\frac{d\alpha_1}{ds}, \quad \beta_2=R\frac{d\beta_1}{ds}, \quad \gamma_2=R\frac{d\gamma_1}{ds}.$$

When the arc s is the independent variable, that is, when $u=s$, equations (14) and (16) take simple forms,

$$\frac{1}{R^2}=\frac{d^2x}{ds^2}+\frac{d^2y}{ds^2}+\frac{d^2z}{ds^2};$$

$$\alpha_2=R\frac{d^2x}{ds^2}, \quad \beta_2=R\frac{d^2y}{ds^2}, \quad \gamma_2=R\frac{d^2z}{ds^2}.$$

Applying the same process to torsion, $d\tau^2=d\alpha_3^2+d\beta_3^2+d\gamma_3^2$, and a differentiation of (9) gives

$$d\alpha_3=-\frac{Bdz-Cdy}{\sqrt{A^2+B^2+C^2}}\,\frac{Ad^3x+Bd^3y+Cd^3z}{A^2+B^2+C^2},$$

$$(17) \quad d\beta_3=-\frac{Cdx-Adz}{\sqrt{A^2+B^2+C^2}}\,\frac{Ad^3x+Bd^3y+Cd^3z}{A^2+B^2+C^2},$$

$$d\gamma_3=-\frac{Ady-Bdx}{\sqrt{A^2+B^2+C^2}}\,\frac{Ad^3x+Bd^3y+Cd^3z}{A^2+B^2+C^2},$$

whence

$$(18) \quad \text{torsion}=\frac{1}{T}=\frac{d\tau}{ds}=-\frac{Ad^3x+Bd^3y+Cd^3z}{A^2+B^2+C^2}.$$

The radical $\sqrt{A^2+B^2+C^2}$ is to be taken throughout with positive sign. The numerator in the value of torsion, written in the form of a determinant, is $\begin{vmatrix} dx & dy & dz \\ d^2x & d^2y & d^2z \\ d^3x & d^3y & d^3z \end{vmatrix}$, and its evanishment for all values of u is the necessary and sufficient condition that the space curve is in reality a plane curve. If it vanishes only for isolated values of u, the planes of osculation at the corresponding points are *stationary*, that is the plane of osculation does not tend to change in passing to the consecutive point. Curvature and therefore R are always taken positive. This, however, is not the case with torsion; its sign may be positive or negative and is determined without ambiguity in the foregoing equation. A space curve is said to have a right (left) twist at P if it appears to an observer, standing at P on the plane of osculation (either side) and looking in the direction of the center of curvature, to rise from left (right) to right (left) through P. The above formula, with this definition of twist, associates right twist with positive torsion and left twist with negative torsion.

The Frenet Equations.—These are nine very important equations in which the quotients of the differentials of the direction cosines of the lines of the principal triedral divided by ds, are expressed in terms of the direction cosines and R and T. Six of these equations are already at hand: from (16)

$$(19) \qquad \frac{d\alpha_1}{ds}=\frac{\alpha_2}{R}, \quad \frac{d\beta_1}{ds}=\frac{\beta_2}{R}, \quad \frac{d\gamma_1}{ds}=\frac{\gamma_2}{R};$$

from (11), (17), and (18)

$$(20) \qquad \frac{d\alpha_3}{ds}=\frac{\alpha_2}{T}, \quad \frac{d\beta_3}{ds}=\frac{\beta_2}{T}, \quad \frac{d\gamma_3}{ds}=\frac{\gamma_2}{T};$$

from (11′) by differentiation, with substitutions from (19) and (20),

$$(21) \qquad \frac{d\alpha_2}{ds}=-\frac{\alpha_1}{R}-\frac{\alpha_3}{T}, \quad \frac{d\beta_2}{ds}=-\frac{\beta_1}{R}-\frac{\beta_3}{T},$$

$$\frac{d\gamma_2}{ds}=-\frac{\gamma_1}{R}-\frac{\gamma_3}{T}.$$

The equations were also given later by Serret and are sometimes called by his name. They are particularly used in the differentiation of equations, and are of importance in questions relating to the determination of curves with assigned properties.

2. *The Curve and its Associated Curves and Surfaces.*—There are four ruled surfaces on which the space curve lies and a fifth ruled surface on which it does not lie, to all of which surfaces it sustains special relations. The tangents at all the points of the curve constitute the *tangential surface* of the curve. This surface consists of two sheets with the space curve as a sharp edge. A normal plane at P intersects the two sheets of the surface in a curve which has P as a cusp point. The space curve is the locus of intersections of consecutive tangents and is called the *edge of regression* of the tangential surface. The surface is a developable surface,[1] namely, one which could be supposed laid down in a plane without stretching. To the space curve there is an infinity of involutes all lying in the tangential surface. One may imagine a string stretched on the curve and so unwound that the part continually being freed from the curve remains tangent to the curve; each point of the string will describe an involute on the tangential surface to which the space curve is an evolute.

The locus of the binormals of the curve is called the *surface of the binormals*. It is a non-

developable or skew surface.[1] The infinitely small arc element is perpendicular to the binormals at its extremities, whence it follows that the space curve is the *line of striction*[1] of its binormal surface.

The locus of the principal normals is a skew surface and is called the *surface of the principal normals*. The space curve is an orthogonal trajectory of the right lines of the surface and is also an asymptotic[1] line of the surface. This latter property follows from the fact that the planes of osculation of the curve are tangent planes to the surface at the points of the curve.

The locus of the lines of rectification is a developable surface and is called the *surface of rectification* of the curve. It owes its name to the circumstance that when it is developed in a plane, the space curve is transformed into a straight line. From this it follows that a space curve is a geodesic[1] on its surface of rectification. That the space curve passes into a straight line when the surface of rectification is developed in a plane, is readily established from the Frenet equations (21). The angle between two consecutive planes of rectification, $d\kappa$, vanishes in the development of the surface, or $d\kappa^2 = d\alpha_2^2 + d\beta_2^2 + d\gamma_2^2 = 0$. Writing (21) in the form $d\alpha_2 = -\alpha_1 d\varepsilon - \alpha_3 d\tau$, $d\beta_2 = \ldots$, $d\gamma_2 = \ldots$, squaring and adding, there results $ds^2 + d\tau^2 = 0$, or $d\varepsilon = 0$, $d\tau = 0$. As the angle of contingence is zero, the consecutive tangents of the developed curve coincide, and the curve is a straight line.

The fifth ruled surface is the locus of the axes of curvature. It is a developable surface, not containing the curve, but containing the curve of centers of curvature and also the curve of centers of the osculating spheres. The surface bears the name of *polar surface*, or *evolute surface*. The axis of curvature is sometimes called polar axis and hence the name polar surface. To the space curve as an involute there is an infinity of evolute curves all lying on the polar surface, and hence the name evolute surface. If one imagined a string stretched freely on the polar surface with one extremity at P of the space curve, the part of the string on the surface would lie in one of the evolutes of the space curve. Further, if two strings were supposed joined at P, each lying on an evolute, and the two strings then unwound from the polar surface, the point P would describe the space curve, and the angle between the strings at P would remain constant in the motion. The polar surface is the common surface of rectification of all the evolutes, and these curves are, accordingly, geodesics of the surface.

The curve of centers of curvature is the intersection of the polar surface and the principal normal surface. Its equations are

$$(22) \qquad \xi = x + R\alpha_2, \quad \eta = y + R\beta_2, \quad \zeta = z + R\gamma_2.$$

Those of the axis of curvature are

$$\xi = x + R\alpha_2 + v\alpha_3, \quad \eta = y + R\beta_2 + v\beta_3,$$
$$\zeta = z + R\gamma_2 + v\gamma_3$$

for u constant and v variable. If u is regarded as variable as well as v, the equations define the polar surface. Two consecutive axes of curvature, say the axes of P and P_1, intersect in a point of the edge of regression of the surface, but the point as a point on the first axis is equidistant from P, P_1, P_2, and as lying on the second axis is equidistant from P_1, P_2, P_3, and is therefore equidistant from P, P_1, P_2, P_3 or is the center of the osculating sphere at P. The edge of regression of the polar surface is the locus of the centers of the osculating spheres of the space curve. Analytically treated the problem gives for the equations of the locus of centers of the osculating spheres:

$$(23) \qquad \xi = x + R\alpha_2 - \frac{dR}{d\tau}\alpha_3, \quad \eta = y + R\beta_2 - \frac{dR}{d\tau}\beta_3,$$

$$\zeta = z + R\gamma_2 - \frac{dR}{d\tau}\gamma_3,$$

and for the radius, r, of the sphere

$$(24) \qquad r^2 = R^2 + \left(\frac{dR}{d\tau}\right)^2.$$

There is a complete reciprocity between a space curve and the edge of regression of its polar surface when, and only when, the space curve is a curve of constant curvature, *i.e.*, R = constant. Equations (23) reduce to (22), showing that the curve on the polar surface becomes the locus of the centers of curvature of the space curve. Some of the relations between the two curves when R = constant are here stated: Each is the locus of the centers of curvature of the other with the same constant curvature; the tangent of the one is the axis of curvature of the other; the corresponding plane of osculation of the one is the normal plane of the other; corresponding planes of rectification are parallel; angle of contingence of the one equals angle of torsion of the other. The last two properties hold also when R is not constant.

If a space curve is spherical, its polar surface will be a cone with vertex at the center of the sphere, and the polar edge of regression reduces to a point, the center of the sphere. ξ, η, ζ are, accordingly, constants for all values of u, and their differentials are zero. The differentiation furnishes $Rd\tau + d\left(\frac{dR}{d\tau}\right) = 0$ as the necessary and sufficient condition for a spherical curve.

Spherical Depiction.—Each point of the space curve is coördinated with a point on the surface of a unit sphere in a definite manner. Assume a sphere of radius one with center at the origin of axes, and draw a radius to a point p of the surface parallel to the positive direction of the tangent at the point P of the curve. The point p is the spherical image or picture of P with respect to the tangent, and the picture of all the points of the space curve is a curve called the *spherical indicatrix of the space curve with respect to the tangent*. Similarly, there are spherical images with respect to the principal normal, binormal, etc. Such depictions lead to problems concerning the determination of curves with given spherical images.

Intrinsic Equations.—A space curve is completely determined as to its form, though not as to its position in space, when curvature and torsion are given in terms of the arc s of the curve. Two equations of this character are called the intrinsic equations of the curve. To pass from the intrinsic equations $R = f(s)$,

$T=g(s)$ to the parameter representation requires the integration of a differential equation of the Riccati form. A discussion of the problem is given in Darboux, Vol. I, and in Scheffer, Vol. I (see paragraph on literature of subject). Curvature and torsion do not change in value when the curve is moved about in space, nor do the successive derivatives of curvature and torsion with respect to s change in value. These quantities and all functions of them are called differential invariants with respect to all movements of the curve in space.

3. *Special Curves.*—The curve of constant curvature, $\frac{1}{R}=$constant, has already been spoken of. It is obvious that in the development of the tangential surface in a plane, the curve transforms into a circle. Any curve of this class of radius of curvature R is given by the equations

$$x=R\int \lambda d\theta, \quad y=R\int \mu d\theta, \quad z=R\int \nu d\theta,$$

in which λ, μ, ν are any three functions of θ that satisfy the two equations,

$$(25)\quad \lambda^2+\mu^2+\nu^2=1, \quad \left(\frac{d\lambda}{d\theta}\right)^2+\left(\frac{d\mu}{d\theta}\right)^2+\left(\frac{d\nu}{d\theta}\right)^2=1.$$

Direct differentiation of the equations of the curve will show that $\lambda=\alpha_1$, $\mu=\beta_1$, $\nu=\gamma_1$, and $d\theta=d\varepsilon$.

The curve of constant torsion $\frac{1}{T}=$ constant is defined by the equations

$$x=T\int\left(\mu\frac{d\nu}{d\theta}-\nu\frac{d\mu}{d\theta}\right)d\theta, \quad y=T\int\left(\nu\frac{d\lambda}{d\theta}-\lambda\frac{d\nu}{d\theta}\right)d\theta,$$

$$z=T\int\left(\lambda\frac{d\mu}{d\theta}-\mu\frac{d\lambda}{d\theta}\right)d\theta,$$

where λ, μ, ν are functions of θ satisfying the conditions (25). Again, direct differentiation of the equations shows $\lambda=\alpha_3$, $\mu=\beta_3$, $\nu=\gamma_3$, and $d\theta=d\tau$. Examples of curves of constant torsion are furnished by the asymptotic curves of surfaces of constant negative (Gauss) curvature.[1] This theorem was established by Enneper, 'Göttinger Nachrichten,' 1870.

The curves in which the ratio of curvature and torsion is constant, $\frac{T}{R}=$constant, is a helix, namely, a curve on a cylindrical surface that intersects all the right-line generators of the surface under a constant angle. This curve is a general helix. When, however, both curvature and torsion are constant, the curve becomes the ordinary helix, *i.e.*, the helix on a right circular cylinder. A helix passes into a straight line when the cylindrical surface is developed in a plane. The cylindrical surface is its surface of rectification, and the right-line generators are the lines of rectification. The helix is, accordingly, a geodesic of the cylindrical surface, and this property itself could be taken as the definition of a helix. The principal normals are all parallel to a plane perpendicular to the generators of the cylindrical surface. The original sources on the subject of the helix are Puiseux, 'Journ. de Math.,' 7 (1842); Bertrand, 'Journ. de Math.,' 13 (1848).

Bertrand found that if a curve is of such a character that there exists between its curvature and torsion a linear relation with constant coefficients, $\frac{a}{R}+\frac{b}{T}=1$, there is one, and only one, other curve which has the same principal normals as the first. The length on a principal normal between corresponding points of the curves is constant. The associated curves are called Bertrand curves. The theorem suffers exception when the curvature and torsion are both constant, namely, in the case of the ordinary helix. Here there is an infinity of Bertrand curves, all helices on the common principal normal surface. Bertrand, 'Journ. de Math.,' 15 (1850); J. A. Serret, 'Journ. de Math.,' 16 (1851).

The ordinary helix holds, relative to space curves, a position somewhat similar to that held by a circle relative to plane curves. The circle is the curve of constant curvature (torsion $=0$), and the ordinary helix is the curve of constant curvature and constant torsion. At a point of a plane curve, one circle may be passed having contact of the second order with the curve, or, as one may say, the circle and curve have three consecutive points in common, and, in general, no more than three points. It is the circle of osculation of the curve. Through three consecutive points P, P_1, P_2 of a space curve a single infinity of ordinary helices may be passed, but none will have in general more than the three points in common with the curve. All elements that depend on three consecutive points are common elements of the curves, viz., tangent, plane of osculation, principal normal, circle of curvature, at P. Among the helices is one whose principal normal at P_1 coincides with the principal normal of the space curve at the same point. This helix has the same torsion and curvature as the space curve at P, and is called the osculating helix of the space curve at the point P.

The length of a finite portion of a curve defined by equations (2) rests upon the evaluation of a definite integral. If on the arc lying between M and P points are marked in succession proceeding from M toward P, viz., M, Q_1, Q_2, $\ldots$ Q_{n-1}, P, and the chords $MQ_1, Q_1Q_2, \ldots Q_{n-1}P$ are drawn, there will be formed an inscribed polygon, the length of which will vary with the number of inscribed points and their position. But if the number of sides of the polygon be indefinitely increased, and each side be indefinitely diminished, the length of the polygon will approach a definite limiting value. This definite limiting value is defined to be the arc length from M to P. If M corresponds to the parameter value $u=u_0$, and P to the general value u, the arc length s is the definite integral

$$s=\int_{u_0}^{u}\sqrt{\left(\frac{dx}{du}\right)^2+\left(\frac{dy}{du}\right)^2+\left(\frac{dz}{du}\right)^2}\,du.$$

Whence by differentiation the linear element of arc is

$$ds^2=\left[\left(\frac{dx}{du}\right)^2+\left(\frac{dy}{du}\right)^2+\left(\frac{dz}{du}\right)^2\right]du^2=dx^2+dy^2+dz^2$$

The foregoing theory of the space curve contains implicitly the assumption that the arc

element ds is not zero; an assumption which holds for all real curves. In dropping the condition that ds may not be zero, one is led to certain imaginary curves defined by the differential equation

$$\left(\frac{dx}{du}\right)^2+\left(\frac{dy}{du}\right)^2+\left(\frac{dz}{du}\right)^2=0.$$

These curves are called minimal curves and are either minimal right lines or minimal twisted curves with tangents that are minimal right lines. The right lines

$$x=a_1+b_1u,\quad y=a_2+b_2u,\quad z=a_3+b_3u$$

satisfy the above differential equation when $b_1^2+b_2^2+b_3^2=0$.

The values of the constants b_1, b_2, b_3, taken subject to this condition, furnish a single infinity of minimal right lines lying on an imaginary cone with vertex at the point (a_1, a_2, a_3). The intersection of the cone by the plane of infinity is the imaginary circle at infinity. The minimal lines through any point of space are the lines joining the point to the points of the imaginary circle at infinity. The twisted minimal curves are all represented by the equations

$$x=\tfrac{1}{2}(1-u^2)f''(u)+uf'(u)-f(u),$$

$$y=\frac{i}{2}(1+u^2)f''(u)-iuf'(u)+if(u),$$

$$z=uf''(u)-f'(u).$$

The accents indicate differentiation with respect to u; $i=\sqrt{-1}$; and $f(u)$ is a function of the complex imaginary variable u. $f(u)$ is restricted only in that its third derivative must not be zero. Elements of the curve which do not essentially rest on ds can be obtained in the usual way, viz., tangent, plane of osculation, etc. As the plane of osculation contains two consecutive tangents, it touches the imaginary circle at infinity. The tangential surface of the minimal curve accordingly circumscribes the circle at infinity. Inversely, a minimal curve can be defined as the edge of regression of a developable surface circumscribing the imaginary circle at infinity. The introduction of the minimal right lines and the imaginary circle at infinity enables one to express certain metric relations in projective form. The minimal curves find very elegant application in the theory of minimal surfaces[1] (real).

The point P, to which all the developments have been attached, is supposed to be an ordinary point of the curve. A point is ordinary when this point and points on the curve in its immediate vicinity can be represented by the same three equations of form (2), each point corresponding to a single value of u. The three functions $\phi(u)$, $\chi(u)$, $\psi(u)$ must be developable in power series at the point, and the three first derivatives must not be simultaneously zero. As an example of a singularity it is obvious that these conditions are not satisfied by a point at which the curve intersects itself. The singularities of a twisted curve are discussed in Cayley, Collected Works, Vol. I, 8; Fine, Amer. Jour. of Math., 8; Staude, Amer. Jour. Math., 17.

4. *Classification and Literature.*—Curves are divided into algebraic and transcendental curves, according as their equations are or are not algebraic. The *order* of a space curve is the number of points of intersection (real or imaginary of the space curve by an arbitrary plane. The *rank* of the curve is the number of tangents intersected by an arbitrary straight line, *i.e.*, it is the order of the tangential surface of the curve. The *class* of the curve is the number of planes of osculation that pass through an arbitrary point of space. At present there is no known system of elements which suffice to characterize the general space curve. There is no proper curve of the second order; there is one family of curves of the third order; there are *two* families of curves of the fourth order, a fact which puts in evidence that order of curve does not in itself suffice to characterize space curves. When to order is added the number of apparent double points, viz., the number of chords which can be drawn through an arbitrary point of space, a differentiation is effected, but this again fails in the case of curves of the ninth order. Cayley established formulas for the space curve corresponding to the Plücker formulas for plane curves. Cayley, Collected Mathematical Papers, Vol. I, p. 207.

The first systematic treatment of space curves was given by Clairaut in 1751, 'Traité de courbes à double courbure.' Among the older sources not hitherto mentioned are Lancret, 'Mémoires présentés . . . à l'Académie des sciences' (1806); de Saint-Venant, 'Journal de l'École polytechnique.' The more important treatises and texts that give more or less complete representations of the theory are Darboux, 'Leçons sur la théorie générale des surfaces' (Paris, 1887–1896); Laurent, 'Traité d'analyse,' 2, 7 (Paris); Bianchi, 'Lezioni di geom. diff. Pisa' (1885–86, translated into German by Lukat, Leipsic, 1899); Joachimsthal, 'Anwendung der Differential- und Integralrechnung auf die allgemeine Theorie der Flächen und der Linien doppelter Krümmung' (Leipsic, 1890); Hoppe, 'Lehrbuch der anal Geom.' (Leipsic, 1880); Scheffers, 'Anwendung der Differential- und Integralrechnung auf Geometrie' (Leipsic, 1902); Salmon-Fiedler, 'Anal. Geom. des Raumes' (Leipsic, 1880); Schell, 'Allgemeine Theorie der Curven doppelter Krümmung in rein geometrischer Darstellung' (Leipsic, 1898); Salmon, 'Geometry of Three Dimensions.'—[1] See SURFACES, THEORY OF.

JAMES MACLAY,
Professor of Mathematics, Columbia University.

Curves, Higher Plane.—A curve can be looked upon in many ways; geometrically as the intersection of two surfaces, as the locus of a moving point, or envelope of a moving line; analytically as a representation of an equation in point- or line-coordinates, and therefore as yielding a singly infinite system of points or lines. But if this view be adopted, the «curve» must not necessarily be regarded as identical with the system of points; for most curves (not all) have tangents, hence a curve yields also a system of lines, of equal importance with the system of points; a definition that lays stress on one system to the exclusion of the other is incomplete. This was recognized by Plücker ('Theorie der algebraischen Curven,' 1839, p. 200), in his statement of the dual generation of a curve: «If a point continually moves along a straight line, while the line continually rotates about the point, one and the same curve is enveloped by the line and described by the point.» Clifford ('Math. Papers,' pp. 40–42)

treats the true curve as an undefined entity, of which the assemblages of points and lines are two distinct manifestations. The present tendency is towards this view, at least as regards an algebraic curve,—a curve whose equation, whether in point- or line-coordinates, is algebraic. A curve whose Cartesian equation cannot be reduced to an algebraic form, *e.g.*, $y=\sin x$, is non-algebraic or transcendental. It is convenient to treat first of algebraic curves.

If x, y satisfy an algebraic equation $f(x, y)=0$, it can be shown that $\frac{dy}{dx}$ has a definite value $\left(=-\frac{\partial f}{\partial x}:\frac{\partial f}{\partial y}\right)$ unless both $\frac{\partial f}{\partial x}$ and $\frac{\partial f}{\partial y}$ vanish. There is therefore a tangent, $Y-y=(X-x)\frac{dy}{dx}$, *i.e.*, $(X-x)\frac{\partial f}{\partial x}+(Y-y)\frac{\partial f}{\partial y}=0$; in homogeneous coordinates $X\frac{\partial f}{\partial x}+Y\frac{\partial f}{\partial y}+Z\frac{\partial f}{\partial z}=0$. The coordinates of the tangent are: $\xi:\eta:\zeta=\frac{\partial f}{\partial x}:\frac{\partial f}{\partial y}:\frac{\partial f}{\partial z}$; the elimination of x, y, z from these equations and $f(x, y, z)=0$ gives an algebraic equation $\phi(\xi, \eta, \zeta)=0$, the line equation (tangential equation) of the curve. Thus the curve has two equations, both algebraic, a point equation of degree m, a line equation of degree n; these two numbers m, n, the order and class of the curve, are the number of points that lie on an arbitrary line, the number of tangents that pass through an arbitrary point; they belong respectively to the point system and the line system, not to the curve itself. A number that is more intimately associated with the curve is the genus, p, to be defined later.

An algebraic curve cannot break off; the tangent cannot suffer a sudden change in direction; no finite part of the curve can coincide with a straight line. Thus the normal character of an arc of an algebraic curve expresses gradual and continuous change of position (motion of point), gradual and continuous change of direction (motion of tangent), as stated by Plücker.

The number of terms in the equation $f(x, y, z)=0$ is $\frac{1}{2}(m+1)(m+2)$; the number of disposable constants is therefore $\frac{1}{2}(m+1)(m+2)-1$, *i.e.*, $\frac{1}{2}m(m+3)$. Hence passage through $\frac{1}{2}m(m+3)$ arbitrary points determines the curve; while if the curve passes through $\frac{1}{2}m(m+3)-q$ arbitrary points, the coefficients can be expressed linearly in terms of q parameters, and the curve has q degrees of freedom. If the points are not arbitrary, the curve may have mobility greater than q, or it may break up into curves of lower order. The theory is really that of the intersections of curves. Two curves of orders m, m' intersect in mm' points, for the elimination of z from the equations produces an equation of degree mm' for $x:y$. The m^2 intersections of two m-ics, u, v, do not determine an m-ic (although $n^2>\frac{1}{2}m(m+3)$), for all curves $u+kv=0$ pass through the points; the m^2 points impose precisely $\frac{1}{2}m(m+3)-1$ conditions. Similarly, the mm' intersections of C_m and $C_{m'}$ do not impose independent conditions on all curves; *e.g.*, the 20 intersections of C_4 and C_5 impose 14 conditions on a quartic, 17 on a quintic, 19 on a sextic, but 20 on all higher curves. The most convenient statement is: the quartic excess is 6, the quintic excess is 3, the sextic excess is 1 (Macaulay). The first notice of theorems of this character is due to Maclaurin (1720); the first explanation was given by Euler and Cramer (1748–1750). From these has arisen the whole modern theory of groups of points on a curve (geometry on a curve). (Scott, 'Bull. Am. Math. Soc.,' 2d series, v. 4, pp. 260–273; 1897–8.)

The fundamental theorem is the Cayley-Bacharach theorem (1843, 1886); a C_n through all except $\frac{1}{2}(l+m-n-1)(l+m-n-2)$ of the intersections of C_l and C_m will pass through the remainder unless these lie on a curve of order $l+m-n-3$. In particular ($l=n$) precisely $\frac{1}{2}(m-1)(m-2)$ of the intersections of a fixed C_m by a variable C_n are a consequence of the rest if $n>m-3$; but if $n\leqq m-3$, fewer than $\frac{1}{2}(m-1)(m-2)$ are a consequence. Thus no matter what the order of the cutting curve, the number of the induced intersections can never exceed $\frac{1}{2}(m-1)(m-2)$. This number, which limits the interconnexion of points on the curve of order m, is called the genus of the curve, and is usually denoted by p. The genus of a quartic, *e.g.*, is 3; 3 points on a quartic follow from 5 intersections with a conic, or from 9, 13, 17 intersections with a cubic, quartic, or quintic, and so on.

If a curve has multiple points, corresponding theorems hold and preserve their significance, provided the cutting curve is an adjoint curve, that is, a curve with a multiple point of order $k-1$ where the fixed curve has a multiple point of order k. The genus, the number p which limits the interconnexion, is in this case $\frac{1}{2}(m-1)(m-2)-\frac{1}{2}\Sigma k(k-1)$. (Macaulay, 'Proc. Lond. Math. Soc.,' v. 26, pp. 495–544; 1895; F. Hardcastle, 'Report on Point-Groups,' in progress in Proc. of the Brit. Asso.; Brill-Noether Bericht, 'Die Entwicklung der Theorie der algebraischen Functionen in alterer und neuerer Zeit,' 1894.)

Multiple points arise when two or more points of the system occupy the same position in the plane; according to the number of points that coincide, the point is double, triple, etc. Double points (dps) are nodes or cusps; a node is the coincidence of two non-consecutive points, a cusp is the coincidence of two consecutive points; similarly double tangents are either bitangents or inflexional tangents. The cusp and inflexional tangent are also called stationary point and line, on account of the effect of the singularity on the motion of the point and line by which the curve is described.

The coincidence of two points at P causes an arbitrary line through P to meet the curve in two points there; hence if P be taken as origin, the terms of the first degree in the equation will vanish. The conditions for a double point at x, y, z are therefore the vanishing of f, $\frac{\partial f}{\partial x}$, $\frac{\partial f}{\partial y}$, $\left(\text{in homogeneous coordinates, of } \frac{\partial f}{\partial x}, \frac{\partial f}{\partial y}, \frac{\partial f}{\partial z}\right)$. Two lines can be found to meet the curve in more than two points at P; these are the tangents; they are given by the terms of degree 2 equated to zero. Similarly the conditions for a k-point are the vanishing of the $\frac{1}{2}k(k+1)$ derivates $\frac{\partial^{k-1} f}{\partial x^\alpha \partial y^\beta \partial z^\gamma}$ $(\alpha+\beta+\gamma=k-1)$, and there are k tangents, lines which meet the curve in more than k points.

If the tangents at a dp are distinct, the point is a node, formed by the crossing of

two simple branches, real or imaginary according as the tangents are real or imaginary. In this last case, the point is detached from the main body of the curve, and is called an isolated point, or acnode, the visible crossing being called a node, or crunode. If the tangents are coincident, and meet the curve in precisely three points, the point is a cusp; if the coincident tangents meet the curve in more than three points, the singularity is complex.

Elimination of $x:y:z$ from $\frac{\partial f}{\partial x}=0, \frac{\partial f}{\partial y}=0, \frac{\partial f}{\partial z}=0$ gives a condition, $D=0$, to be satisfied by the equation of any curve that has a dp. Hence a general locus of order m has no point-singularities, and a general envelope of class n has no line-singularities. But a general envelope has point-singularities and a general locus has line-singularities; for the direction of a tangent, given by the value of $\frac{dy}{dx}$, is unchanged if $\frac{d^2y}{dx^2}=0$, *i.e.*, if

$$\frac{\partial^2 f}{\partial x^2}\left(\frac{\partial f}{\partial y}\right)^2-2\frac{\partial^2 f}{\partial x\partial y}\cdot\frac{\partial f}{\partial x}\cdot\frac{\partial f}{\partial y}+\frac{\partial^2 f}{\partial y^2}\left(\frac{\partial f}{\partial x}\right)^2=0.$$

This condition, and $f=0$, are only two equations, and consequently no condition is imposed on the locus by the existence of line-singularities.

If a curve of order m, class n, has ν nodes, κ cusps, τ bitangents, ι inflexional tangents, these numbers are connected by Plücker's equations. The tangent at x, y, z is

$$X\frac{\partial f}{\partial x}+Y\frac{\partial f}{\partial y}+Z\frac{\partial f}{\partial z}=0;$$

this passes through x', y', z' if x, y, z lies on the curve $x'\frac{\partial f}{\partial x}+y'\frac{\partial f}{\partial y}+z'\frac{\partial f}{\partial z}=0$, the polar of x', y', z' with respect to f. Since this curve, $\Delta f=0$, is of order $m-1$, it meets f in $m(m-1)$ points; two of these lie at every node, three at every cusp; hence the number of tangents from x', y', z' is

$$n=m(m-1)-2\nu-3\kappa. \quad . \quad . \quad (1)$$

Similarly from the line-equation,

$$m=n(n-1)-2\tau-3\iota. \quad . \quad . \quad (1')$$

The condition that the tangent at x, y, z be stationary becomes in homogeneous coordinates

$$\begin{vmatrix} \frac{\partial^2 f}{\partial x^2} & \frac{\partial^2 f}{\partial x\,\partial y} & \frac{\partial^2 f}{\partial x\,\partial z} \\ \frac{\partial^2 f}{\partial x\,\partial y} & \frac{\partial^2 f}{\partial y^2} & \frac{\partial^2 f}{\partial y\,\partial z} \\ \frac{\partial^2 f}{\partial x\,\partial z} & \frac{\partial^2 f}{\partial y\,\partial z} & \frac{\partial^2 f}{\partial z^2} \end{vmatrix}=0;$$

the point of contact must lie on this curve, $H(f)=0$, the Hessian of f, of order $3(m-2)$. At a node on f, H has a node with the same tangents; at a cusp, H has a triple point, composed of two branches touching the cuspidal tangent with one branch cutting it; the numbers of intersections are 6 and 8. Hence

$$\iota=3m(m-2)-6\nu-8\kappa, \quad . \quad . \quad . \quad (2)$$

and reciprocally

$$\kappa=3n(n-2)-6\tau-8\iota. \quad . \quad . \quad . \quad (2')$$

Any one of these four equations can be obtained algebraically from the others. From these we can find also (3 and 3′) expressions for τ in terms of m, ν, κ, and for ν in terms of n, τ, ι.

These six are Plücker's equations; three only are independent. It must not however be supposed that we can choose any three of the numbers arbitrarily. There is a limit to the number of dps that a proper curve can have; $\nu+\kappa>\frac{1}{2}(m-1)(m-2)$. For if the curve had one more, a curve of order $m-2$ could be passed through the dps and $m-3$ other points on the curve; but this would have with f intersections in number $2[\frac{1}{2}(m-1)(m-2)+1]+m-3$, *i.e.*, $m(m-2)+1$, which is impossible. A curve can actually have this number of dps; it is then called rational (or unicursal), because the coordinates of any point can be expressed rationally in terms of a parameter, as follows: The dps and $m-3$ other points on f determine $(m-2)$-ics with one degree of freedom, a system $u+kv=0$. Of the $m(m-2)$ intersections of one of these with f, all except one are at the fixed points; the coordinates of the one remaining variable intersection are therefore given rationally in terms of the parameter k by $f=0, u+kv=0$.

If the curve has not this number of dps, let it have $\delta(=\nu+\kappa)$; the number $\frac{1}{2}(m-1)(m-2)-\delta$, which has already been given as the genus, was originally called the deficiency of the curve (Cayley).* From Plücker's equations we find

$$\tfrac{1}{2}(m-1)(m-2)-\nu-\kappa=\tfrac{1}{2}(n-1)(n-2)-\tau-\iota,$$

i.e., the point deficiency and the line deficiency are equal; the deficiency (or genus) does not belong specially to the point system or the line system. In particular, if the curve is rational quâ locus, it is rational quâ envelope. If we introduce p for the genus, the equations assume a convenient form,

$$n+\kappa=2m+2(p-1), \quad m+\iota=2n+2(p-1),$$

$$m(m-3)-2(\nu+\kappa)=2(p-1)=n(n-3)-2(\tau+\iota).$$

There are other limitations on these numbers, but the theory is not complete. Clebsch proved (Crelle, v. 64, p. 51; 1864) that the number of cusps on a rational curve cannot exceed $\frac{3}{2}(m-2)$; the more general question as to the maximum number of cusps for a curve of assigned order awaits solution.

So far the singularities have been supposed to be simple. A multiple point of order higher than the second is, in a certain sense, equivalent to a number of simple singularities. If the tangents at a k-point are distinct, the point arises from the crossing of k branches; these cause $\frac{1}{2}k(k-1)$ intersections, nodes by the geometrical definition. It can be shown that such a point reduces the class of the curve, the number of inflexions, and the genus, by $2\times\frac{1}{2}k(k-1)$, $6\times\frac{1}{2}k(k-1)$, $\frac{1}{2}k(k-1)$ respectively. Thus not only is the point explained geometrically by $\frac{1}{2}k(k-1)$ nodes, but as regards Plücker's equations it is equivalent to these nodes. Nevertheless the point cannot be replaced by these nodes for all purposes, *e.g.*, as regards the number of conditions; the k-point imposes $\frac{1}{2}k(k+1)$ conditions, whereas the nodes would impose $\frac{1}{2}k(k-1)$, *i.e.*, $\frac{1}{2}k(k+1)+k(k-1)$. It is an im-

* During the last thirty years the whole theory of plane algebraic curves has been modified in important points by the influence of the theory of functions; in particular, this has shown the significance of the genus.

portant fact that this equivalence does hold as regards the conditions imposed on adjoint curves; the presence of the $(k-1)$-point on the adjoint imposes $\frac{1}{2}k(k-1)$ conditions, equal to the number that would be imposed on the adjoint by $\frac{1}{2}k(k-1)$ separate nodes on f.

If the tangents are not distinct, the matter may become very complicated. The multiple point immediately revealed by the equation may be but one of a series of multiple points indefinitely close together, and the singularity then involves also multiple tangents. The determination of the point- and line-components, the «analysis of higher singularities,» has received much attention. If the singularities are regarded as singularities of the equation, the question is properly considered from the algebraic standpoint. At an ordinary point of the curve, y can be expanded in an ascending series of positive integral powers of x, provided $x=0$ is not the tangent; at a k-point the process is not directly applicable, it requires some modifications, and then leads to k expansions, with exponents either integral or fractional. An expansion with fractional exponents, whose L.C.D. is q, is accompanied by the $q-1$ conjugate expansions, thus forming a cycle of order q (Puiseux). The integral expansion is a cycle, $q=1$, and the k-point is represented by a number of cycles of orders $q_1, q_2, q_3, \ldots$, where $\Sigma q = k$. The number of cusps in a cycle is $q-1$; this agrees with the known facts about the simple cusp ($y=x^{\frac{3}{2}}$, $y=-x^{\frac{3}{2}}$), and is accepted as the algebraic definition of cusps. The algebraic definition of a node is indirect; ν is determined so that $2\nu+3\kappa$ shall be equal to twice the total number of intersections of all the branches (the discriminantal index of the singularity); it is proved that this definition yields always a positive integral value for ν. (Chrystal, 'Algebra,' v. 2, 1889, pp. 359–371; Harkness and Morley, 'Treatise on the Theory of Functions,' 1893; pp. 127–151; Brill-Noether Bericht, pp. 367–402 for full references.)

The process as outlined above, dealing with the expansions as a whole, simply enumerates the components, algebraically defined, of a singularity; it affords no clue to the structure. This structure can however be put in evidence by means of the critical exponents of the expansions, those in whose denominators a new factor appears. These show that the dps are combined into certain multiple points, and thus they lead to an algebraic description of the singularity. (H. J. S. Smith, 'Proc. Lond. Math. Soc.,' v. 6, pp. 153–182; 1876; Halphén, 'Mém. prés. à l'Ac. des Sc. de Paris,' v. 26, 1877; Zeuthen, 'Math. Ann.,' v. 10, pp. 210–220, 1876.) A different treatment of the expansions, due to Noether, gives a clearer idea of the structure.

By a geometrical process, depending on the simplest Cremona transformation (see below), it is possible not only to enumerate the multiple points and lines contained in any singularity, but also to construct a penultimate form to indicate the arrangement of these components. (Scott, 'Am. J. Math.,' v. 14, pp. 301–325; v. 15, pp. 221–243; 1892–3.)

The various processes lead to the following conclusions as to the content of a complex singularity. The point-equation by its lowest terms gives the order, k, of the singularity; the line-equation gives the class, l. If the singularity has all its tangents coincident (if it has not, it can be broken up into simpler ones) then order + class = number of intersections with the tangent at the point, and thus the class is known without reference to the line-equation. Coincident tangents may lead to other multiple points, or to chains of multiple points, contained in the singularity; if the total number of dps in these is h, the singularity has h latent double points. It has also latent double lines, h' in number, and it has been proved that $h'=h$. The singularity of order k, class l, excess h (supposed irreducible), involves $\frac{1}{2}k(k-1)-h$ dps, of which $k-1$ are cusps, and $\frac{1}{2}l(l-1)+h$ dls, of which $l-1$ are inflexional tangents. The singularity is equivalent to these components as regards Plücker's equations and as regards the genus; but not in the number of conditions imposed on the curve.

It is obvious that the multiple points of a curve cannot always be chosen arbitrarily. A sextic, *e.g.*, can have 10 dps; but these, chosen arbitrarily, would impose 30 conditions, whereas 27 determine the sextic. The 27 conditions cannot be imposed by 9 dps arbitrarily chosen, for these would determine only the reducible sextic $v^2=0$, where v is the cubic through the 9. If the 9 admit of a proper sextic, $u=0$, they allow one degree of freedom, for all curves $u+kv^2=0$ satisfy the conditions. Hence the 9 are not arbitrary. The theorems of geometry on a curve, and linear systems of curves, lead to general results of this character, but there are evidently many special theorems as to the position of singularities to be formulated for curves of specified order or class.

By means of a birational transformation, either of the whole plane or of the one curve, it is possible to change any curve into one, in general of different order, with no point-singularities except simple nodes. Let P, (x, y, z) become P', (x', y', z') (represented on a second plane for distinctness), where x', y', z' are given by

$$x' : y' : z' = \phi_1(x, y, z) : \phi_2(x, y, z) : \phi_3(x, y, z);$$

then corresponding to any point P of the first plane Π there is one point P' of the second plane Π'; but the converse does not hold. The ∞^2 straight lines of Π', $lx'+my'+nz'=0$, correspond to the ∞^2 transformation-curves in Π, $l\phi_1+m\phi_2+n\phi_3=0$, of order σ; to a single point P' of Π', given as the intersection of two lines, there correspond in Π all the κ variable intersections of two ϕ's, $P_1, P_2, \ldots, P_\kappa$; the correspondence of the two planes is said to be «κ-to-one», $(\kappa, 1)$. Since the ϕ's may have fixed points, simple or multiple, $A_1, A_2, \ldots$ of orders $\rho_1, \rho_2, \ldots, \kappa$ may be less than σ^2.

If $\kappa=1$, *i.e.*, if one point of Π corresponds to one point of Π', the equations of transformation are reversible; not only is Π' expressed rationally in terms of Π by these equations, but also Π is expressed rationally in terms of Π' by

$$x : y : z = \phi_1(x', y', z') : \phi_2(x', y', z') : \phi_3(x', y', z'),$$

the reverted equations, which are of the same order σ. The transformation is a birational transformation of the *plane*, usually called a Cremona transformation. In the simplest Cremona transformation the ϕ's are conics through three fixed points; the equations of transformation are therefore of the second degree; this is a reversible quadratic transformation. An im-

portant theorem is that every Cremona transformation can be accomplished by a succession of these reversible quadratic transformations.

If $\kappa > 1$, the equations cannot be reverted; the transformation is not birational for the whole plane. But if P_1 trace a curve F, P' traces the corresponding curve F'; the points $P_2 \ldots P_\kappa$ trace some curve, f (different from F), the companion curve of F. If we ignore all of Π except F, that is, if we confine ourselves to the two curves F, F', the correspondence becomes one-to-one; with the help of the equation $F = 0$ the equations of transformation can be reverted, and the transformation becomes birational. Such a birational transformation of a *curve* is called a Riemann transformation. Thus a Riemann transformation is birational for the one curve only, while a Cremona transformation is birational for the whole plane, and therefore for every curve in the plane.

The importance of transformation is due to its effect on singularities. The fixed points $A_1, A_2, A_3, \ldots$ in Π have no correspondents in Π', but a point close to A_i in a determinate direction has a determinate correspondent, and if a point describes a small circuit about A_i, the corresponding point in Π' describes a curve α_i', rational and of order ρ_i; thus is a fundamental curve of the second plane. If F passes k times through A_i, F' cuts α_i' in k points; if the k directions through A_i are distinct these points are all separate, and thus the multiple point on F is dissipated. If any of the k tangents at A_i coincide, F' has contact with α_i', or it may have a multiple point on α_i', but of a less complex character than the original at A_i; and by repetitions of the process the singularity is made to disappear.

But new singularities may arise, due to fundamental curves in the first plane. Such fundamental curves might be defined by means of the reverted equations of transformation; but as it is not usually convenient actually to form these (at least in the case of a Riemann transformation), it is simpler to adopt an independent definition. An irreducible curve β that meets the transformation curves ϕ only at their fixed points is a fundamental curve of the system; all points on such a curve, β, correspond to a single point B' of Π', or, more precisely, to points close to B' in different directions. If then F meets β in h points, F' has at B' a multiple point of order h.

Finally, new multiple points, in general only simple nodes, arise on F' owing to the passage of F through associated points of the first plane (intersections of two ϕ's). Such passages are indicated by intersections of F with its companion curve f; hence they are in general inevitable.

By either transformation, Cremona or Riemann, the multiple points on the given curve can be dissipated, whether the tangents are distinct or coincident. A Cremona transformation-system, however, always has fundamental curves, whose number is equal to that of the fundamental points (Bertini, 'Palermo Rendiconti,' v. 3, pp. 5–21, 1889); hence when F is transformed, new multiple points, possibly of high order, will arise unless the Cremona system is specially chosen. A Riemann transformation-system, on the contrary, need not have any fundamental curves, hence in general the new multiple points that arise will be simple nodes.

A Riemann transformation, however, requires the elimination of $x:y:z$ from the equations of transformation, of degree σ, together with $F = 0$, of degree m; whereas a Cremona transformation is accomplished by the direct substitution of $\phi_1(x', y', z')$, $\phi_2(x', y', z')$, $\phi_3(x', y', z')$ for x, y, z. (Salmon, 'Higher Plane Curves,' chap. 8 in the German translation by Fiedler; also references at end; Scott, 'Quart. Jour.,' v. 29, pp. 329–381, 1898; v. 32, pp. 209–239, 1900.)

When a curve is subjected to a birational transformation of either kind, Cremona or Riemann, the induced points of a group of intersections transform into the induced points of the transformed group; this affords one proof (Bertini) of the important theorem that two curves which are birationally connected are of the same genus. The converse is not true; curves of the same genus cannot necessarily be birationally transformed into one another. A curve of genus p depends in general on $3(p-1)$ characteristic constants, the so-called moduli; if these are equal for two curves, then the two are birationally equivalent. (Clebsch-Lindemann, 'Vorlesungen über Geometrie,' 1876, pp. 709–720.)

Closely connected with this is the transformation of a curve into itself. This however is more conveniently considered as an independent theory, that of correspondence of points on a curve. (Cayley, 'Proc. Lond. Math. Soc.,' 1865–6; no. 385, v. 6, Coll. Papers; 'Phil. Trans.,' 1867–8; no. 407, v. 6, Coll. Papers; Brill, 'Math Ann.,' v. 36, pp. 321–360, 1890; Brill-Noether Bericht, pp. 530–531.)

An entirely distinct class of investigations deals with the form of curves (topology, analysis situs). The method employed is usually variation of the coefficients, by which the curve is derived from a known reducible curve of the same order. In this manner Klein proved ('Math. Ann.,' v. 10, pp. 199–209, 1876) that the numbers of the real singularities are connected by the relation

$$m + I + 2T' = n + K + 2A',$$

where I, K, T', A' are the numbers of real inflexions and cusps, isolated tangents and isolated points, on a curve of order m, class n. Hence if the curve has no point-singularities, $I + 2T' = m(m-2)$, from which it follows, since $\iota = 3m(m-2)$, that not more than one third of the inflexions of a non-singular locus can be real. Klein's relation has been proved algebraically by Brill ('Math. Ann.,' v. 16, pp. 348–408, 1880), and extended to complex singularities. There is no corresponding restriction on the bitangents; all may be real.

Topological theorems relate in general to the nature, number, and arrangement of the distinct parts (circuits) of a curve. The first division of circuits, due to von Staudt, is into odd and even, for the number of real intersections with an arbitrary line is always odd or always even. An odd circuit necessarily extends through infinity. Simple examples are the oval and the infinite branch of a bipartite cubic $y^2 = (x-a)(x-b)(x-c)$; but circuits may be much more complex. Let the minimum number of real intersections with a straight line be called the index of the circuit. Zeuthen showed ('Math. Ann.,' v. 7, p. 426, 1874) that a quartic may have a circuit of index 2, with two nodes; Cayley showed ('Phil. Mag.,' v. 29,

1865; no. 361, v. 5, Coll. Papers) that a sextic may have a circuit of index 2, without multiple points. It has been proved (Scott, 'Trans. Am. Math. Soc.,' v. 3, pp. 388–398, 1902) that for every order m there exists a curve ($p=0$ or 1), composed of a single circuit of index $m-2$, or $m-4$, $m-6$, down to 0 or 1, according as m is even or odd; any such circuit of index k can be produced by a simple process of linking from k odd circuits. The Zeuthen quartic circuit finds its place in this category, it is due to the linking of two odd circuits; but the non-singular sextic circuit is entirely different in character, and a general theory of such circuits is still to be suggested.*

The possible number of circuits is $p+1$ (Harnack, 'Math. Ann.,' v. 10, pp. 189–198, 1876); for every order m there exist curves with this maximum number of circuits, and with every smaller number.

The question of arrangement has been considered only with reference to circuits that can be projected into the finite, the so-called ovals. Hilbert ('Math. Ann.,' v. 38, pp. 115–138, 1891) discussed curves with «nested ovals», whose simplest type is the annular quartic, composed of one oval inside another; the number of nested branches cannot exceed $\frac{1}{2}(m-2)$ or $\frac{1}{2}(m-3)$, according as m is even or odd; moreover, non-singular curves with the maximum number of circuits and the maximum number of nested ovals do exist.

Hilbert draws attention to the arrangement of the eleven ovals of a non-singular sextic ($p=10$); he states that one of these must lie inside another (p. 118). It appears highly probable (V. Ragsdale, 'Bull. Am. Math. Soc.,' v. 11, p. 464, 1905) that this unproved theorem of Hilbert's is the simplest case of a general law in accordance with which at least $\frac{1}{2}(q-1)(q-2)$ of the circuits of a non-singular curve of order $2q$ must lie inside some of the remaining $q^2+\frac{1}{2}(q-1)(q-2)$.

Thus as regards circuits the only question completely solved is that of the possible number; their nature, their arrangement as regards one another, or as regards the straight lines of the plane (on which depends the answer to the inquiry whether all the even circuits can be projected simultaneously into the finite), have been hardly touched upon, though there must be many interesting results awaiting discovery.

Although the general theory of polars belongs properly to the theory of algebraic forms, it supplies convenient expression for some geometrical facts. The first polar of x', y', z' is the curve of order $m-1$, $\Delta f=0$, where Δ denotes the operator $x'\frac{\partial}{\partial x}+y'\frac{\partial}{\partial y}+z'\frac{\partial}{\partial z}$. A second operation with Δ produces the second polar, $\Delta^2 f=0$, of order $m-2$, and so on; thus any point has $m-1$ polars, of which the last two are the polar conic and polar line. The polar conic of a dp is simply the pair of tangents; the polar conic of an inflexion consists of the inflexional tangent together with another line which does not pass through the inflexion; thus in both cases the polar conic has a dp. It is easily proved that if the polar conic of B has a dp A, the first polar of A has a dp B. This suggests three derived curves: the locus of points A, the Steinerian, of order $3(m-2)^2$; the locus of points B, the Hessian, of order $3(m-2)$; the envelope of the line AB, the Cayleyan. Thus, *e.g.*, the curve by which the points of inflexion are determined, the Hessian, is geometrically defined; every point is in a known geometrical relation to f. On the other hand though it is known that a curve of order $(m-2)(m^2-9)$ can be passed through the points of contact of the bitangents, no geometrical definition of any such curve has yet been formulated. The curve is of course not unique; what is needed is a geometrical definition of some one curve that shall meet f only at these points of contact, and at the multiple points, in such a manner as to account for the whole number of intersections. (Cayley, 'Coll. Papers,' v. 11, pp. 471, 473.)

The metric properties of a curve are important in particular questions, though not in the general theory. The curve has m points at infinity; at each of these there is a tangent, which is an asymptote unless it lies entirely at infinity. Consequently for every non-repeated direction to infinity there is an asymptote; for a repeated direction there may or may not be asymptotes. A twofold direction, *e.g.*, may be accounted for either by contact with the straight line at infinity, with no asymptote, or by a dp at infinity, with two asymptotes, distinct or coincident. A branch that has a real asymptote is called hyperbolic; a branch that has contact with the straight line at infinity, whether at a simple point or at a multiple point, is called parabolic.

The curve has n imaginary tangents from each of the circular points; these by their intersections determine the n^2 foci, of which n are real (Plücker's definition, 1833); but the number of foci is diminished if the curve passes through the circular points or touches the straight line at infinity.

There is a theory of diameters; these are the polars of points at infinity. The polar line of a point at infinity is the locus of the mean center of the m intersections of the curve with chords through the point (proved by Newton for cubics); this property of a diametral line is analogous to the bisection property of a diameter of a conic. The other polars (curvilinear diameters) also can be explained in terms of the segments of the chords. (Salmon, H. P. C., chap. 4.)

The first enumeration of varieties of a curve of any order beyond the second is Newton's 'Enumeratio linearum tertii ordinis,' 1706. He proves that all the 72 varieties (it should be 78) can be obtained by projection from the five types of cubic with an inflexional tangent at infinity (divergent parabolas), bipartite, unipartite, crunodal, acnodal, and cuspidal. Similarly when once the distinct types of a curve of any order have been enumerated, the varieties can be obtained at once. There are 144 types of quartic (R. Gentry, 'On the forms of plane quartic curves,' 1896); the number for higher curves, even for quintics, must be very great. It does not appear that any special purpose would be served directly by the enumera-

* For the connection with symmetric Riemann surfaces, see Klein, 'Math. Ann.,' v. 7, pp. 558–566, 1874; v. 10, pp. 415, 416, 1876; 'Über Riemann's Theorie der algebraischen Functionen und ihrer Integrale,' 1882; pp. 66–69 in F. Hardcastle's translation; 'Lectures on Mathematics' The Evanston Colloquium' 1894, pp. 30–32; Harkness and Morley, 'Treatise on the Theory of Functions,' pp. 274–276.

tion of these, though there are matters of interest on which this might throw light. For example, the theory of the inflexional tangents of a cubic has been thoroughly worked out; suitably taken in threes they determine three inflexions on a straight line; the three tangents and this line form a framework for the curve. As regards quartics, a closely corresponding theory is that of the bitangents ; suitably taken in fours, these determine sets of eight points on the quartic, each set lying on a conic; the curve is conveniently referred to the four bitangents and the conic. What is the generalization of this? even for the quintic, this is as yet unknown.

A more profitable classification of curves is according to their genus, and the values of the $3(p-1)$ characteristic constants, or moduli. Rational ($p=0$), elliptic ($p=1$), and hyperelliptic curves (which include among others all curves with $p=2$) have been extensively treated. (Clebsch-Lindemann, pp. 883–903, 903–915, 915–923; also 711–712, 717–720; Loria, 'Il passato ed il presente delle principali teorie geometriche,' 2d edition, 1896, pp. 76–79 for references.)

Investigations on special classes of algebraic curves are too numerous to mention; in particular, bicircular quartics and cartesians (with nodes, or cusps, at the circular points) have a literature to themselves. The Steiner curve, or deltoid (hypocycloid with three cusps), is perhaps the most interesting individual among algebraic curves, on account of its geometrical properties. (Loria, 'Il passato,' etc., pp. 61–76.)

If a curve has an equation that cannot be expressed in finite algebraic form it is said to be transcendental. Algebraic and transcendental curves, however, are by no means as widely separated as this would suggest; *e.g.*, the equation $r=\sin b\theta$ represents curves which are algebraic when b is rational, transcendental for all other values of b. Thus the algebraic curves of the series bear to the whole series the relation that is borne by rational numbers to all numbers; they are isolated members, whose number is insignificant. The same is probably true of all algebraic curves; they are isolated members of transcendental families. It is not surprising, therefore, that there is as yet no general theory of transcendental curves. Results proved for algebraic curves by means of the whole equation (*e.g.*, Plücker's equations) are not applicable to transcendental curves, which from one point of view are of infinite order; while results that depend only on a small arc are in general applicable. Such knowledge as we have of transcendental curves is obtained from metric investigations of special curves.

Among these special curves, one of the most important divisions is that of roulettes. A roulette is traced by a point attached to a curve, which itself rolls without sliding on a fixed curve. A point on the circumference of a circle which rolls on a straight line traces a cycloid; if the circle rolls in or on a circle the roulette is an epicycloid or hypocycloid. If the point is not on the circumference of the rolling circle, the curve is a trochoid, epitrochoid, or hypotrochoid. The epicycloid or hypocycloid is algebraic if the radii of the two circles are commensurable. An important theorem, due to Descartes, is that the normal to a roulette at any point passes through the corresponding point of contact of the rolling curve with the fixed curve.

Some of the best known of the transcendental curves are the spiral of Archimedes, $r=a\theta$; the hyperbolic spiral, $r\theta=a$; the logarithmic spiral, $r=a^{\theta}$, which cuts all its radii vectores at a constant angle; the logarithmic curve, $y=a^x$, or $x=m\log y$, which is noteworthy on account of the curious discontinuity of the negative branch (Salmon, H. P. C., chap. 7); the catenary, $y=\frac{c}{2}\left(e^{\frac{x}{c}}+e^{-\frac{x}{c}}\right)$, the form assumed by a chain hanging from two points of support; the tractrix, $x=c\log\frac{c+\sqrt{c^2-y^2}}{y}-\sqrt{c^2-y^2}$, which cuts all the tangents to the catenary orthogonally; this curve is of special interest on account of the use made of it by Beltrami ('Saggio d'interpretazione della geometria non-euclidea,' 1868). (For detailed references see Loria, 'Spezielle algebraische und transscendente ebene Kurven,' trans. by Schütte; 1902.)

All the curves hitherto mentioned have tangents, which vary continuously from point to point; but there are curves, graphical representations of certain functions, which differ in this respect. A curve may have a tangent at every point, which yet may not vary continuously; *e.g.*, «polygonal lines,» $y=\int_0^x f(x)dx$, where $f(x)$ is a certain arithmetic functions; such a curve is composed of a number of segments of straight lines. (Gravé, 'Compte-rendus,' v. 127, pp. 1005–1007, 1898.)

There are curves which are continuous, and yet have no definite tangents; the classic example, due to Weierstrass, is $y=\sum_{n=0}^{n=\infty} b^n\cos\alpha^n x\pi$ (Wiener, 'Crelle,' v. 90, pp. 221–252, 1881). The explanation of the impossibility of assigning the tangent at any point is that in any finite interval the curve makes an infinity of oscillations.

Another possible deviation from the natural idea of a curve was discovered by Peano ('Math. Ann.,' v. 36, pp. 157–160, 1890). He shows that it is possible to construct functions $\phi(t)$, $\psi(t)$ of a single variable such that the points $x=\phi(t)$, $y=\psi(t)$ occupy all positions inside a given square; thus a curve can cover a plane area. (For detailed discussion of such curves, see E. H. Moore, 'On Certain Crinkly Curves,' Trans. Am. Math. Soc., v. 1, pp. 72–90, 1900.)

These examples show clearly that the most general idea of a curve is far removed from the comparatively simple idea first presented in analytical geometry. The definition at present accepted of a plane curve without multiple points, due to Jordan and Hurwitz, has been thus expressed in English (by Osgood): « a set of points which can be referred in a one-to-one manner and continuously to the points of a segment of a right line, inclusive of the extremities of the segment, if the curve is not closed, and to the points of the circumference of a circle if the curve is closed.» (Hurwitz, 'Verhandlungen des ersten internationalen Mathematiker-Kongresses in Zürich,' 1897, pp. 102, 103.)

CHARLOTTE ANGAS SCOTT,
Professor of Mathematics, Bryn Mawr College

Curwen, kėr'wĕn, **John,** English musical educator: b. Heckmondwike, Yorkshire, 14 Nov. 1816; d. Heaton, Mersey, England, 26 May 1880. He became a minister of the Independent body, being in 1844 elected pastor at Plaistow, Essex. Here he developed and promoted the Tonic Sol-fa method, and brought the system still more before public attention by the publication of his 'Grammar of Music' and 'Lessons in Music' in 'Cassell's Popular Educator.' In 1853 he established the Tonic Sol-fa Association, and in 1862 the Tonic Sol-fa College. He published, among other works connected with the system, the 'Child's Own Hymn-Book'; 'The Standard Course of the Tonic Sol-fa Method'; 'How to Observe Harmony.'

Curwen, John Spencer, English musical writer: b. Plaistow, Essex, 30 Sept. 1847. He is a son of John Curwen (q.v.), and has been editor of the 'Music Herald' from 1866. He was educated at the Royal Academy of Music, becoming president of the Tonic Sol-fa College in 1880, and has traveled much in Europe and America investigating the subject of music in schools. He has published: 'Studies in Worship Music'; 'Memorials of John Curwen'; 'The Boy's Voice'; 'School Music Abroad'; 'Music at the Queen's Accession.'

Curzola, koor'dzō-lä, Austria, the most beautiful of the Dalmatian islands, in the Adriatic, stretching west to east about 25 miles, with an average breadth of four miles; area, 85 square miles. It is covered in many places with magnificent timber. The fisheries are very productive.

Curzon, George Nathaniel (Baron Curzon of Kedleston), English viceroy in India: b. Kedleston 11 Jan. 1859. He was educated at Eton and Balliol College, Oxford; became assistant private secretary to the Marquis of Salisbury in 1885, and next year was elected member of Parliament for the Southport division of Lancashire, which he represented till 1898. He was under-secretary for India in 1892, and in 1895 became under-secretary of state for foreign affairs. In 1898 he was appointed viceroy of India, and at the same time created a peer (in the Irish peerage) by the style of Baron Curzon of Kedleston. His published works are: 'Russia in Central Asia in 1889 and the Anglo-Russian Question' (1889); 'Persia and the Persian Question' (1892); 'Problems of the Far East; Japan — Corea — China' (1894). As viceroy his aim throughout was to reduce to a minimum the minute and report writing, and run the railways, the post and telegraph services and other large government monopolies in accord with the needs and spirit of the age. He resigned as viceroy 20 Aug. 1905. On 14 March 1907 he was elected chancellor of Oxford University.

Cusa, koo'sä, or **Cusanus, Nikolaus** (originally **Nikolas Chrypffs,** or **Krebs**), German ecclesiastic: b. Kues, near Treves, 1401; d. Todi, Umbria, Italy, 11 Aug. 1464. As archdeacon of Liège he took the anti-papal side at the Council of Basel; but was ultimately bishop of Brixen in Tyrol, cardinal, and papal legate to Constantinople. He exposed the false Isidorian decretals, denounced perverted scholasticism in 'De Docta Ignorantia,' taught that the earth went round the sun, and in his pantheistic tendencies was a precursor of Giordano Bruno.

Cusack, Mary Frances, Irish writer; better known as the Nun of Kenmare: b. Dublin 6 May 1820; d. 7 June 1899. Originally a Protestant she became a Roman Catholic, and joined the Poor Clares, one of the sisterhoods of Saint Francis, and for 23 years conducted a convent of the order at Kenmare. When in 1884 she established the Sisters of Peace, an order similar to the Poor Clares, but with a wider range, not only did Leo XIII. sanction the work, but she received the hearty support of Christians, both Catholic and Protestant. She visited the United States in 1886. Among her many published books are: 'Student's History of Ireland'; 'Woman's Work in Modern Society'; 'The Pilgrim's Way to Heaven'; 'Jesus and Jerusalem'; lives of Saint Patrick, Daniel O'Connell, etc.

Cuscatlán, Salvador, a department bounded on the north by the departments of Chalatenango and Cabañas, on the east by the same departments and San Vicente; on the south by San Vicente and La Paz, and on the west by the department of San Salvador. The greater part of its surface is covered by lofty mountain ranges separated by narrow valleys; toward the north and northeast, however, near the Cuezalapa and Lempa rivers, there are comparatively level districts. The department was formed in 1835, and was originally much more extensive than it is at present (that is, 1,078 square miles), including until 1855 all of the Chalatenango region, and until 1875 a portion of what is now Cabañas. It is an agricultural country, the chief products being coffee, sugar, indigo, rice, tobacco, starch, cheese, and cereals. Twice each year the people gather from all parts, in Cojutepeque at the Feast of Saint John, 29 August, and at Suchitoto, 8 December, to exchange native products for foreign merchandise. The capital, Cojutepeque (pop. about 8,000), is situated near the summit of an extinct volcano, 2,614 feet above sea-level. Its streets are narrow and crooked, but the suburbs are beautiful. It has a town-hall, hospital, public school, four churches, public baths, etc. There are 17 towns in the department, the more important being Suchitoto, San Pedro, Perulapán, Tenancingo, San Rafael, and Guayabal. Pop. (1901) 72,000.

Cusco-bark, or **Cuzco-bark,** the bark of *Cinchona pubescens,* which comes from Cuzco, in South America, and is exported from Arequipa. It contains a peculiar alkaloid called cusco-cinchonine, or cusconine, which resembles cinchonine in its physical qualities, but differs from it in its chemical properties. When applied medicinally it excites warmth in the system, and is therefore recommended in cold intermittents and low typhoid states.

Cuscus, kŭs'kŭs, a marsupial native to the islands of the Australian group and New Guinea. It is generally about the size of a house cat; has a small head, large eyes, and a dense coat of fur, often pure white irregularly flecked with black, though this is variable. There are several distinct species. The food of all seems to be generally leaves and fruit, together with birds and other small animals. They frequent only forests of large trees, often swinging themselves from bough to bough by their long prehensile tails. They belong to the family of the phalangers (q.v.); and the genus *Cuscus* embraces a number of species, differing in habi-

tat and color. The best-known species perhaps is *Cuscus orientalis.*

Cuscuta'ceæ. See DODDER.

Cush, kŭsh, in the Old Testament, the eldest son of Ham, also a country frequently mentioned. Cush, as a country, appears to be African in most passages, and it is generally believed that the country intended can be no other than the region in Africa, south of Egypt, in ancient times designated more or less loosely as Ethiopia, and corresponding to the modern Nubia and northern Abyssinia. That it adjoined Egypt is shown by the passage in Ezekiel which states that the desolation of Egypt is to extend «from the tower of Syene unto the border of Cush.» In a number of passages, also Cush, or its inhabitants, is mentioned in connection with Egypt. Cushites, for example, came out of Egypt with Shishak against Jerusalem. In other places again it is evident that the name Cush must be understood as referring to some part of Arabia. That several localities should be called by the same name may be explained by the frequent migrations of the early nations, who would give their own name to the countries into which they successively arrived.

Cushew-bird, kŭsh'ō-bĕrd, another name for the galeate curassow. See CURASSOW.

Cushing, kŭsh'ĭng, **Caleb,** American jurist and diplomatist: b. Salisbury, Mass., 17 Jan. 1800; d. Newburyport, Mass., 2 Jan. 1879. His intellectual abilities manifested themselves early. He entered Harvard College at 13 and was graduated in 1817. He then studied law, was admitted to the bar at 22 and soon acquired an extensive practice, standing with Rufus Choate (q.v.) at the head of the Essex bar. He was a member of Congress 1835–43, and in the last-named year having left the Whig party, was appointed by President Tyler United States commissioner to China. He was an enthusiastic supporter of the Mexican war, raising a regiment and accompanying it to Mexico, for which he was promoted to the rank of brigadier-general. He was attorney-general of the United States 1853–7, and was president of the Democratic Convention in Charleston, S. C., in April 1860. During the Civil War period he was several times employed on confidential missions by President Lincoln and the heads of departments, and in 1868 was sent to Bogotá to settle a diplomatic difficulty, which he did successfully. In 1866 he was member of a commission to revise and codify the laws of Congress; he was appointed counsel before the Geneva Arbitration Tribune 1871–2; and was minister to Spain 1874–7. His legal decisions were distinguished both for sagacity and professional erudition. He filled a large place in the political history of his time, but the services which he performed for his country are scarcely remembered now. It should not be forgotten, however, that he negotiated the first American treaty with China, while as member of the Massachusetts legislature for several terms, and mayor of Newburyport, he did good service to his State and city. He published: 'Practical Principles of Political Economy' (1826); 'History of Newburyport' (1826); 'Historical and Political Review of the Late Revolution in France' (1833); 'Reminiscences of Spain' (1833); 'Growth and Territorial Progress of the United States' (1839); 'Life of William Henry Harrison' (1840).

Cushing, Frank Hamilton, American ethnologist: b. Northeast, Pa., 22 July 1857; d. Washington, D. C., 10 April, 1900. He became interested in Indian relics, and when 19 years old was made curator of the ethnological exhibit at the Centennial Exposition in Philadelphia. Accompanying Powell's New Mexico expedition, he settled among the Zuni Indians for the purpose of study. In 1881 he conducted excavations in Arizona, and in 1895 discovered archæological remains in Florida. In 1897 he became connected with the United States Bureau of Ethnology. Among his works are: 'The Nation of the Willows' (1882); 'My Adventures in Zuni' (1883); 'Manual Concepts' (1892); 'Zuni Folk Tales' (1902).

Cushing, Harry Alonzo, American educator: b. Lynn, Mass., 1870. He was graduated at Amherst College 1891, and took graduate studies at Columbia University 1894–6. He has published 'History of the Transition from Provincial to Commonwealth Government in Massachusetts' (1896). He was lecturer in history and constitutional law at Columbia 1903–7 and from 4 Feb. 1907 professor of law.

Cushing, Luther Stearns, American lawyer: b. Lunenburg, Mass., 22 June 1803; d. Boston 22 June 1856. He was the only graduate of the Harvard Law School in 1826. He was clerk of the Massachusetts House of Representatives 1832–44, and reported the decisions of the State supreme court 1850–6, preparing 12 volumes of law reports for those years. He was lecturer on Roman law at the Harvard Law School 1848–56, but is best known for his 'Manual of Parliamentary Practice' (1844), which immediately became an authority in parliamentary assemblies throughout the English-speaking world, and remained so for half a century. Other of his works are: 'Treatise on Trustee Process' (1837); 'Treatise on Remedial Law' (1837); 'Reports of Controverted Election Cases in Massachusetts' (1852); 'Introduction to the Study of Roman Civil Law' (1854); 'Lex Parliamentaria Americana' (1856), and translations of several legal works from the French and German.

Cushing, Thomas, American statesman: b. Boston, Mass., 24 March 1725; d. there 28 Feb. 1788. He was graduated from Harvard 1744; was elected speaker of the Massachusetts Assembly 1766–74, and was a member of the first and second continental congresses 1774–5, being defeated for re-election because he opposed a declaration of independence. In 1783 he was lieutenant-governor of Massachusetts, and a member of the convention that ratified the Federal Constitution 1788. John Adams describes him as being exceedingly useful to the patriot leaders in obtaining valuable secret information. He was one of the founders of the American Academy of Arts and Sciences

Cushing, William, American jurist: b. Scituate, Mass., 1 March 1732; d. there 13 Sept. 1810. He was graduated at Harvard in 1751, became judge of probate in Maine in 1768, judge of the Massachusetts superior court in 1772, and chief justice in 1777. Washington appointed him associate justice of the Supreme Court of the United States in 1789, and in 1796 offered him the post of chief justice, which he declined.

Cushing, William Barker, American naval officer: b. Delafield, Wis., 4 Nov. 1842; d. Washington, D. C., 17 Dec. 1874. He entered the navy as a volunteer officer in 1861, and was promoted to a lieutenancy in the following year. His greatest exploit performed was in October 1864. For some time previous nothing had been able to cope with the Confederate ram Albemarle. She had successfully encountered a strong fleet of Federal gunboats and fought for several hours without sustaining material damage. Cushing volunteered to destroy the ram, and on the night of 27 October accomplished the feat. For this he received the thanks of Congress, and was made a lieutenant-commander, becoming a commander in 1872. See PLYMOUTH, N. C., ENGAGEMENT AT.

Cushman, kŭsh'măn, **Charlotte Saunders,** American actress: b. Boston 23 July 1816; d. there 18 Feb. 1876. She appeared first in opera in 1834, and as Lady Macbeth in 1835. Miss Cushman played sometimes in high comedy, but her name is identified with tragic parts. In 1844 she accompanied Macready on a tour through the northern States, and afterward appeared in London, where she was well received in a range of characters that included Lady Macbeth, Rosalind, Meg Merrilies, and Romeo —her sister Susan (1822–59) playing Juliet. In later years she acted with great success in many cities in the United States and was also prominent as a dramatic reader. She retired from the stage in 1875.

Cushman, Robert, American colonist: b. Kent County, England, about 1580; d. England 1625. He was one of the Pilgrims who accompanied John Carver to Leyden in Holland. In 1617 he and Carver went to London and endeavored to secure a charter to settle in America and enjoy the privilege of absolute freedom of worship. King James refused to grant this concession, but promised not to molest them in the event of their settling in America. In 1619 Cushman and Elder Brewster made another application, and this time the king granted the charter and promised toleration as long as they remained faithful subjects to him. In 1620 Carver and Cushman returned to London, collected funds, made purchases of provisions, and arranged for vessels to transport the Pilgrim colony at Leyden to America. The Speedwell was chartered and sent to Delfthaven to bring the colonists to Southampton, where the Mayflower was engaged to meet them. Cushman and his family embarked on the Speedwell 5 Aug. 1620, and on the 15th both ships set out from Southampton for America. On the 23d leaks in the Speedwell obliged them to put into Dartmouth; they started again on the 31st, but further misfortunes to the Speedwell obliged them to return to Plymouth, where she was abandoned, and 18 passengers, including Cushman, gave up the voyage. He remained in England as the colonists' financial agent and to forward supplies. In July 1621 he sailed for America with his son Thomas, in the ship Fortune, and arrived at New Plymouth 21 November. He sailed for England again 13 December 1621, was captured by the French, but released after a short imprisonment. In 1622 he published an eloquent vindication of the Plymouth colonial enterprise and appealed for missions to the Indians. In 1623, with Edward Winslow, he obtained from Lord Sheffield a grant of territory on Cape Ann and with a new band of devout colonists made the first permanent settlement within the limits of Massachusetts Bay colony. During his brief visit to the Plymouth settlement in December 1621, he preached a sermon on "The Sin and the Danger of Self-love," the first sermon delivered in America that was printed (London 1622). The original edition is of great rarity, only three copies being known to exist. The Charles Deane copy sold at auction in 1898 for $1,000. Reprints of it were published at Boston in 1724, 1780, 1870; at Plymouth 1788 and New York 1858.

Cusins, kŭz'ĭnz, SIR **William George,** English composer: b. London 1835; d. 1893. As a lad of 10 he sang in the Royal Chapel, and developing musical abilities, he was sent to Brussels, where he studied under the leading masters. He secured one of the most valuable scholarships in the Royal Academy of Music before he was 16 years of age, at which time he became organist to the queen. At the age of 32 he took charge of the Philharmonic Society, succeeding Sterndale Bennett, and took important part in the musical development of England, being knighted for such service in 1892. His works include a Concerto in A Minor; a cantata; Gideon, an oratorio; and a number of songs.

Cusk, kŭsk, a fish belonging to the cod family or *Gadidæ* and to the genus *Brosmius* (Cuvier), characterized by an elongated body, a single dorsal fin extending the whole length of the back, fleshy ventral fins, and one barbel at the chin. The American cusk, which is considered specifically distinct from the European, is the *B. flavescens* (Lesueur); its color varies from brownish with yellowish sides to whitish with brownish patches, and the immature fish is of a uniform dark slate color, sometimes with transverse yellow bands; the dorsal, caudal, and anal fins are bordered with bluish black, and edged with white; the dorsal and anal are continued to the base of the tail. The length of the fish varies from two to three feet or more, a small one weighing about four pounds; it is taken generally on the middle bank, with the hook, by the deep water cod-fishers. In the spring it is seen in Boston market, when it is less esteemed than cod, but in the winter it commands a higher price; as a fresh fish it is considered a delicacy, and salted is generally preferred to cod. It is found along the shore of the British provinces, and even to high latitudes. The European species, *B. vulgaris* (Cuvier), called torsk or tusk, is also a northern fish, occurring plentifully among the Shetland Islands, where it forms a considerable article of trade; it is caught, salted, and dried in the same manner as cod; it is common on the coasts of Norway, Iceland, and the Faroe islands. It resembles very much the *B. flavescens,* and the two are considered by some as varieties of one species.

Cuspa'ria Bark, the bark of the *Galipea Cusparia,* and some other species, also called Angostura bark (q.v.).

Cusso, cŭs'ō, a small Abyssinian tree of the rose family (Rosaceæ), having alternate pinnate leaves and dicœcious flowers, which are imported into Europe and used as an anthelmintic.

Cust, küst, **Arthur Perceval Purrey,** English clergyman: b. 1828. He was educated at Brasenose College, Oxford, studied for the Anglican priesthood, was curate of North Church, Hertfordshire 1851–3; rector of Cheddington 1853–62; vicar of St. Mary's, Reading 1862–75; vicar of Aylesbury 1875–6; archdeacon of Buckingham 1875–80; and dean of York from 1880. He has published: 'The Heraldry of York Minster' (1890–6); 'Picturesque Old York' (1896); 'York Minster' (1897.)

Cust, Lionel, English art writer: b. London 25 Jan. 1859. He is the eldest son of Sir Reginald Cust (q.v.) and was educated at Eton and Trinity College, Cambridge. Since 1895 he has been director of the National Portrait Gallery. Among his published works are: 'Artists Represented in Department of Prints and Drawings in British Museum' (1893–6); 'Albrecht Dürer: a Study of his Life and Art' (1897); 'History of the Society of Dilettanti' (1898); 'The Master «E. S.» and the «Ars Moriendi»' (1898); 'History of Eton College' (1899); 'Sir Anthony Van Dyck' (1900); 'Van Dyck's «Chatsworth» Sketch Book' (1901).

Cust, Sir **Reginald John,** English writer: b. Shavington Hall, Shropshire, 25 Sept. 1828. He was educated at Eton, and Trinity College, Cambridge, and was assistant commissioner West Indian Encumbered Estates Court 1865–87, and chief commissioner 1887–92. He has published: 'Treatise on West Indian Encumbered Estates Acts' (1859); 'Marriage with a Deceased Wife's Sister Historically Considered' (1888); 'Early Poems' (1892). He was knighted in 1890.

Custard-apple, a common East Indian name for the fruit of certain species of the *Anonaceæ,* some of them the most delicious of the tropical fruits. The common custard-apple (*A. squamosa*), a native of tropical America, is a large greenish or dark-brown fruit. The tree grows to considerable size. The alligator-pear, sour-sop, and sweet-sop are members of the family. The chief North American representative is the papaw (*Asimina triloba*). This tree grows to a height of 45 feet in favorable locations, the stem being sometimes 10 inches in diameter. The wood is soft, light, and weak, weighing about 24 pounds to the cubic foot. The fruit is a fleshy berry, three to seven inches long, sweet, and edible when ripe, in October. The tree grows along streams from Ontario, through western New York and New Jersey near Pennsylvania, south to Florida and west to Texas and Michigan.

Custer, Elizabeth Bacon, American writer: b. Monroe, Mich., about 1844. In February 1864 she was married to George A. Custer (q.v.). She is author of 'Boots and Saddles, or Life in Dakota with General Custer' (1885); 'Tenting on the Plains, or General Custer in Kansas and Texas' (1887); 'Following the Guidon'; etc.

Custer, George Armstrong, American general: b. New Rumley, Ohio, 5 Dec. 1839; d. 25 June 1876. A West Pointer, graduating June 1861, his first day at the front was at Bull Run, on Kearny's staff; he then went on W. F. Smith's, in charge of balloon reconnaissances; then, for daring courage and endurance, was appointed on McClellan's, and captured the first colors taken by the Army of the Potomac. In 1863 he went on Pleasonton's staff; shortly after, for dashing gallantry, was appointed brigadier-general of volunteers, commanding a Michigan cavalry brigade. He made it famous, and foiled Stuart at Gettysburg, for which he was brevetted major in the regular army. In 1864 his brigade was assigned to Sheridan's corps, and he was noted as one of the most brilliant officers in the Virginia campaigns, winning steady promotions; brevet lieutenant-colonel for Yellow Tavern, brevet colonel for Winchester. On 9 October, in command of the Third Division, he won the splendid victory of Woodstock; on the 19th, at Cedar Creek, he contributed largely to the Confederate defeat made permanently familiar by «Sheridan's Ride,» and was brevetted major-general of volunteers. In the spring of 1865 his division by itself won the battle of Waynesboro, capturing 1,600 prisoners and 11 guns; and followed it up by annihilating Early's command, and capturing all the rest of his artillery and his baggage. He fought at Five Forks and Dinwiddie Court-House, and was brevetted brigadier-general United States Army. After the surrender at Appomattox he was brevetted major-general United States Army, and appointed major-general of volunteers. Assigned to duty in Texas, then appointed chief of cavalry till mustered out of the volunteer service, he asked permission to accept Juarez's offer of the chief command of Mexican cavalry against Maximilian; refused leave of absence, he took the lieutenancy of the Seventh cavalry, and joined it at Fort Riley, Kan., November 1866, under Hancock, who was succeeded by Sheridan in the summer of 1867. Custer shortly after saw his first Indian service; and closed a campaign against the Cheyennes in 1868 by the crushing victory of the Washita (q.v.), where 103 Indian warriors were killed, and the tribe forced to return to their reservation. He was stationed in Kentucky 1871–3. In the spring of 1873 he was sent to Dakota to make head against an Indian insurrection of the first order, organized by Sitting Bull and Crazy Horse, and comprising not only the Sioux but a mass of other tribes in Dakota, Montana, Wyoming, etc. He fought a number of battles, and opened up the Black Hills country. In the spring of 1876 Sheridan made ready for a decisive blow, sending three divisions under Crook, Terry, and Gibbon to unite and crush Sitting Bull on the Yellowstone. Terry and Gibbon united without discovering the Indian army; Crook beat up Crazy Horse's band, and after a sharp skirmish the whole Indian force of 5,000 or 6,000 moved to the Little Big Horn. They were discovered by Terry's scouts, and Terry sent Custer in advance, with his cavalry regiment of 600 men in 11 companies, to bar their escape east; he was to wait for the main body at the junction of the Big Horn and Little Big Horn 26 June. Custer arrived there the night of the 24th; his scouts discovered the Indian village the next morning; from imperfect information he supposed that they were only the 1,200 or 1,500 Pawnees he had known were marching to join Sitting Bull, and he resolved to surround and capture them all. The Indians were on a ridge west of the Little Big Horn; Custer kept five companies, 260 men in all, for a direct attack on the centre, gave four to Major Reno to assail their left (south), and two to Capt. Benteen to make a southern detour of two miles

and come on their right rear, cutting off their retreat. The Indians had broken up their tents and were about to retreat, when they discovered how weak was the assailing force. The three divisions forded the river, and Custer rode for the heart of the Indian line. A rise across the stream masked the enemy, many hundreds of whom lay in a ravine between it and the higher ridge beyond; and as Custer swept down, the savages rode against him and swarmed around to his rear. Outnumbered 20 to 1, the heroic band still fought their way up to the ridge, and a small number with their general reached it; then a fresh band of 1,000 Cheyennes rose up, under Rain-in-the-Face, and not a soul was left alive. Meantime Reno had been repulsed and had taken refuge across the creek; and Benteen never reached the neighborhood of the fight; but rejoined Reno at a bluff on the east, where they held the Indians at bay till Terry arrived next morning. The bodies of the slain division were left as they lay, all horribly mutilated, except Custer's. Forty-two Indians were killed. The battlefield has been marked with a small marble monument where each man fell. Custer wrote 'My Life on the Plains' (1874). His life has been written by Whittaker (1876), and by the general's wife, Elizabeth B. Custer.

Custer Massacre. See CUSTER, GEORGE ARMSTRONG.

Custine, küs-tēn', **Astolphe,** MARQUIS DE, French novelist and writer of travels: b. Niederwiller, Meurthe, France, 18 March 1790; d. near Pau, France, 29 Sept. 1857. He traveled in the British Isles, Switzerland, and southern Italy (1811–22), and afterward in Spain and Russia. He published: 'Mémoires et Voyages' (1830); 'La Russie en 1839' (1843); a tragedy, 'Beatrice Cenci'; and some romances, among them 'Aloysius, or the Monk of St. Bernard'; 'Romuald, or the Vocation.' His 'Letters to Varnhagen von Ense and Rachel Varnhagen von Ense' appeared in 1870.

Custis, George Washington Parke, American writer: b. Mount Airy, Md., 30 April 1781; d. Arlington House, Fairfax County, Va., 10 Oct. 1857. He was the adopted son of George Washington, and wrote 'Recollections of George Washington,' and several plays and orations.

Custom, such a usage as by common consent and uniform practice has become the law of the place or of the subject-matter to which it has relation. General customs are such as constitute a part of the common law and extend to the whole country, while particular customs are those which are confined to a particular district. As a rule, when a contract is made in relation to another, about which there is a well established custom, it is presumed that such custom forms part of the contract and may be always referred to for the purpose of showing the intention of the parties in all those particulars which are not expressed in the contract. If, however, the meaning of the contract is certain and beyond doubt, no evidence of usage will be admitted to vary or contradict it. In order to give validity to a custom it must be certain, reasonable in itself, commencing from time immemorial, and continued without interruption. And a custom which is unreasonable, uncertain, and which savors too much of arbitrary power, is void; consequently where a custom is opposed to a well-settled rule of law, and is calculated and intended to violate such law, the custom will not be allowed to have any effect. The true office of a usage or custom with respect to contracts is to interpret the otherwise indeterminate intention of parties, and to ascertain the nature and extent of their engagements arising not from their express stipulation, but from mere implications and presumptions and acts of a doubtful or equivocal character, or to ascertain the true meaning of words in an instrument where those words have various senses; and custom or usage is sometimes admissible to add new terms not expressed in or covered by the writing.

Custom-house, an establishment where commodities are entered for importation or exportation; where duties, bounties, or drawbacks, payable or receivable upon such importation or exportation, are paid or received, and where ships are entered and cleared. The principal custom-house of the United States is in New York. See NEW YORK CUSTOM-HOUSE.

Customary Law. A usage cannot be sustained in opposition to well established principles of law. To sustain a usage under such circumstances would be extremely pernicious in its consequences, and would render vague and uncertain all the rules of law. A mere custom or usage is therefore without force in opposition to a positive law. Thus a usage for factors to pledge the goods of their principals is void, being against a general rule of law. So the usage for a master of a vessel to sell the cargo without necessity when the vessel is stranded; so of a custom, different from the law in a certain place, to re-enter for a forfeiture incurred by the non-payment of rent. And it is held that the custom and understanding of the merchants in a particular trade cannot be admitted to prove that the barter or exchange of a promissory note, indorsed without recourse, for cotton or any other species of merchandise, carries with it no implied warranty of the past or future solvency of the maker of the note. So where a transaction is within the statute against usury, the usage of trade as to such transaction cannot be received in evidence to show that it is not usurious. Known and settled usages, however, should be respected by courts and juries, unless such usages are against the laws or policy of the country. Usage is evidence of the construction given to the law, and when it is established and uniform it regulates the acts and duties of those who act within its limits. Usage is a matter of fact, and not of opinion. A usage of trade must therefore be proved by instances, and cannot be supported by evidence of opinion merely. It is proved by witnesses testifying of its existence and uniformity from their knowledge obtained by observation of what is practised by themselves and others in the trade to which it relates.

Customs Duties (customary taxes; in the constitutional struggles of mediæval England, so claimed by the sovereigns as of ancient usage and allowance), taxes on the exports and imports of a State or district. Apparently, they were at first port fees for the use of the government quays, warehouses, weights and measures, etc.; but in very ancient times they

became a general source of revenue, and used for sumptuary purposes. The constitutional prohibition of export duties leaves it applicable in the United States to imports alone. In countries of developed commerce these have always been the favorite means of taxation with governments and subjects alike, by a rare and significant harmony. The latter prefer them to direct taxes, as distributing the burden in small unperceived amounts on their daily income, in place of a few severe annual exactions. The former prefer them as making it possible not only to raise a far greater revenue with far less criticism, but actually to win popularity by increasing the burden, in most countries — a unique feature in administrative policy. Direct taxes have been the fertile parent of rebellions; customs duties have generally been popular in proportion to their magnitude. The latter fact is due to two other traits inherent in import taxes; that they furnish an apparent means of transferring the tax burden largely to the foreign producers, and of giving the native producer the monopoly of the "home market." It is obvious that the two are more or less self-contradictory — that the foreigner can share the payment only in proportion to his share of the market, and that if imports were annihilated all taxes would be direct; but the discussion of this subject belongs to the question of protective tariffs (see PROTECTION). Here it need only be said that it is not necessary for dutiable articles to be such as are produced within a country, for a tax to be "protective" in action: they may be high-grade articles needed in manufacturing, the charge upon which forces a resort to inferior native materials, or increases the price of the better goods. This increase is always much greater than the duty, as it includes interest on the extra capital needed to carry on business with the costlier articles, and a further charge for the restricted market due to heightened price.

Customs duties must belong to one of two classes: those charged on given units of weight or measure, as the pound, ton, yard, gallon, etc., called specific duties; and those charged by a percentage on the estimated value, called ad valorem duties. On many kinds of goods the two are combined in what are called compound duties; and a variant of the ad valorem system is what is called the minimum duty, under which all goods costing less than a certain sum are assumed to have cost that amount and are taxed upon it. In the old English disputes between king and Parliament specific duties were called "tonnage" (so much per ton); and ad valorem duties "poundage" (such a per cent on the estimated value in pounds sterling), though levied so as not to be purely ad valorem.

The merits of the two systems are not unanimously agreed upon; indeed, each has its special demerits and disadvantages, which are grave from the standpoint of national welfare. It is fair to say, however, that most of the difficulty of the specific duty lies in the attempt to use it for protective purposes, and that of the ad valorem duty in its enormous volume; that a specific duty for revenue only loses most of its objectionable features if levied on the proper articles, and that a low ad valorem duty would be free from most of the objections of a high one. This will be evident from a glance at each.

Specific duties are simple to calculate, easy to collect, do not require a high grade of official skill, and leave few loopholes for fraud. The great drawback is, that they produce immense inequality of duty from the variation in cost and quality, and that inequality in exactly the wrong direction. That is, a certain number of cents on a pound or yard of cheap material may be very high or even prohibitory, while on expensive material the same may be trivial. Now, if the goods are articles of direct consumption, this places nearly all the burden, or an entire deprivation of use, on the poor, and relieves the rich; if they are raw materials of manufacture, it acts as a bounty on the manufacture of coarser and cheaper goods at the expense of the better qualities, turns capital and labor in that direction, and makes it the interest of manufacturers to produce the cheapest goods possible to sell. On the other hand, if the duties are placed on articles not produced or manufactured in the country, while it will still favor the rich against the poor, at least the internal industries are not demoralized; and by restricting them to very few articles, and those without immense variation in price, the English government avoids the greater part of the former evil. Its duties are collected entirely from 26 articles; one of them, on coal, is an export duty. An objection to specific duties on the part of revenue reformers is, that it enables the government to deceive the people as to the amount they are taxed. These duties have always been the favorites of protectionists, the ad valorem duties being preferred by the revenue-tariff leaders; the United States duties are compound.

The ad valorem duty, theoretically the fairest of all, is full of practical difficulties as a revenue producer, and highly unsatisfactory as a protective system. In the former line, the difficulties of fixing the value, the opportunities for fraud and undervaluation, the temptation to officials to connive, and the expensive skilled officials needed to work it, all stand in the way of its usefulness to the government. The value is usually fixed at the point of export; but that involves minute knowledge by the official of a vast number of trades and manufactures, and the fluctuations of trade conditions; and moreover, the market may have changed materially from the time the duty is assessed to the time the importer pays it, which shifts the burden from the government to the merchant. Furthermore, the plenary powers assumed by the government to throw all the burden of doubt on the importer, to seize his goods on suspicion and confiscate them on proof satisfactory to itself, but not to him, though partially remediable by the courts, and very likely necessary to secure the government, place the importer in a situation by no means free from thorns. And the tedious, costly, and vexatious red tape of invoicing and appraising and satisfaction of legal forms, are bad at best even if necessary; and when reenforced by the zeal of officials anxious to win laurels by harassing importers, and desirous of throwing difficulties in the way of even legitimate trade, make it impossible for small capitalists to bear the risks. Thus the small merchant is driven out of the business and the trade concentrated in a few great houses. But a low duty would take away most of the temptation and most of the need for highly paid officials, and would make it practicable to utilize a much simpler system. As a protective system the drawback is, that the duty falls exactly when

the cheapness of foreign goods, and their consequent liability to compete, make it desirable to raise it. Here, too, the low revenue duty would make the change less serious.

The customs receipts of the United States in 1902 were $254,444,709, as against $308,033,524 from all other sources. This is on the whole a great decline in the ratio of customs to other receipts; the former from the foundation of the government to 1880 had exceeded the latter by about one third, and in 1890 stood $229,668,585 to $173,412,398. In some later years, however, the proportion has been even lower than last year: notably 1898, when it was $149,819,594 to $255,501,741.

Custozza, koos-tōt'zä, Italy, a village in the province of Verona, about 10 miles southwest of the city of Verona. It is noted as being the place where the Italians were twice defeated by the Austrians.

Cut-worm, the caterpillar of an owlet moth of the tribe of *Noctuæ,* and group *Agrotididæ;* and, loosely, many other grubs and worms living in the ground. It stays by day about the roots of plants, and comes forth at night to cut off their tender stems and leaves. Some of the moths fly by day, others only at night; the wings are nearly horizontal when closed; the thorax smooth and slightly convex; the antennæ of the males generally with two rows of tooth-like points on the under side; the fore legs are often spiny. The caterpillars are smooth, shining, naked, dark-colored, with longitudinal pale and dark stripes, and a few black dots on each ring; cylindrical, short, and thick, with 16 legs; the chrysalis is transformed in the ground, without a cocoon. They destroy whole fields of vegetables, and also asters, balsams, and other ornamental plants. The caterpillars vary in length from one to two inches, and are dark ashy gray, with brown head, and a pale dorsal stripe, with minute black dots; the chrysalis is a shining dark brown, and the moth appears from 20 July to the middle of August. The largest is the *A. telifera,* having the fore wings light brown, divided by two transverse bands of wavy dark brown lines, and with three spots (one lance-marked) encircled with dark brown; the hind wings are pearly white, the abdomen gray; expanse of wings at least two inches. The *A. inermis* is slightly smaller; the thorax is reddish brown. The *A. messoria* has the fore wings reddish gray, with five wavy blackish bands and three wing spots; the hind wings whitish, and dusky brown behind; the body grayish; the expanse of wings one and two fifths inches. The *A. tessellata* expands only one and a quarter inches; the fore wings are dark ash, with only a faint trace of bands, and with large alternate pale and black spots; the hind wings brownish gray in the middle, and blackish behind. The *A. devastator,* the moth of the cabbage cut-worm, has the fore wings dark satiny ashy gray, with four wavy, whitish bands edged with black, and white dots and dark spots; the hind wings are a light brownish gray, dusky behind; body gray; expanse of wings one and a half to one and three quarter inches. The only effectual way to prevent their depredations is to open the earth daily at the foot of the growing plants and kill the worms, which are easily found. It is said that a manure of sea mud will protect a garden from these worms; some cultivators protect their cabbage plants by wrapping a walnut leaf or paper cone firmly around the root, secured by an earth embankment.

Cutch, kŭch, India, a principality controlled by Bombay, lying to the south of Sind, area, 6,500 square miles. During the rainy season it is wholly insulated by water, the vast salt morass of the Rann separating it on the north and east from Sind and the Guicowar's dominions. Pop. (1902) 542,612.

Cutch, Gulf of, an inlet of the Arabian Sea, extending into the west coast of India about 100 miles, and forming an outlet for the salt marshes of Cutch in India.

Cutch Gundava, gŭn-dä'vä, Baluchistan, a division occupying a northeast projection, in a great measure separated from the rest of the country by the mountain range of Hala; area, 10,000 square miles. Pop. 120,000.

Cuthbert Bede. See BRADLEY, EDWARD.

Cuthbert, Saint, English anchoret, cenobite, and bishop: b. about 633; d. Farne, Northumbria, 20 March 687. He is one of the three most eminent saints of the Church in England, the other two being Saint Edmund of Edmundsbury, and Saint Thomas à Becket, archbishop of Canterbury. The time and place, and even the country of his birth are unknown, but the most trustworthy historians say he lived from 635 to 687. In his youth he entered the monastery of Melrose (the first Melrose), at that time within the limits of Northumbria, and after making his religious profession there, was successively prior of that abbey, prior of Lindisfarne, bishop of Hexham, and bishop of Lindisfarne, with intervals in which he withdrew from conversation with all men and lived a recluse hermit on the island of Farne. The fame of his sanctity, religious zeal, and miracles was great in his lifetime; but grew steadily greater after his death, and many churches in England were dedicated to him. It is said that his body was found incorrupt when his tomb was opened 11 years after burial. When Norse corsairs threatened Lindisfarne in 875, the monks of Lindisfarne bore the remains to a place of safety inland, and for a time the body had no fixed resting place until deposited at Durham, where, enclosed in a splendid shrine, it remained till the Reformation, an object of veneration and the supposed instrument of incessant miracles.

At the Reformation the shrine, with its costly ornamentation, went to increase the king's treasure, and the body of Cuthbert was buried under the pavement of the Durham Cathedral. The coffin was lifted in 1827 and the body, or rather the skeleton, of the saint, was found wrapped in five robes of embroidered silk; there were three coffins, one within another, namely, an outermost one, made in 1541, within that another, believed to date from 1104, and then the *cista,* in which the relics were deposited when the body was disinterred in 698. His feast is observed on 20 March.

Cuthbert, Ga., the county-seat of Randolph County, on the Central of Georgia Railroad. The town is the trading centre of a fruit-growing and cotton-raising region, and has colleges for men and women. Pop. (1900) 2,641.

Cuticle (Lat. *cuticula,* diminutive of *cutis,* «skin»), a thin, white, pellucid, insensible membrane, covering and protecting the true skin,

with which it is connected by the hairs, exhaling and inhaling vessels, and the *rete mucosum*. See SKIN.

Cutlass (Fr. *coutelas,* «small knife» or «sword»), a short sword used by seamen. The art of fencing with it is different from that with the small sword or broad sword. A guard over the hand is an advantage. It is a very effectual weapon in close contest; on account of its shortness it can be handled easily, and yet is long enough for defense.

Cutlass-fish. See SCABBARD-FISH, or SWORD-FISH.

Cutler, Arthur Hamilton, American educator: b. Holliston, Mass., 26 Jan. 1849. He was graduated at Harvard 1870; spent a few years in business, and in 1876 organized the Cutler School in New York, one of the leading preparatory schools in the United States, which has sent over 300 of its graduates to Harvard, Yale, Columbia, Princeton, and other colleges.

Cutler, Elbridge Jefferson, American educator: b. Holliston, Mass., 28 Dec. 1831; d. Cambridge, Mass., 27 Dec. 1870. He was professor of modern languages at Harvard 1865–70, and widely known as an able and generous literary critic. He published: 'War Poems' (1867); 'Stella' (1868). Consult 'Memoir' by A. P. Peabody (1872).

Cutler, Henry Stephen, American musician: b. Boston, Mass., 7 Oct. 1824; d. Swampscott, Mass., 5 Dec. 1902. He was organist of Trinity Church, New York, 1860–98, and on the occasion of the visit of the Prince of Wales to New York in 1860 the men and boys of Trinity choir were vested for the first time. From this incident the custom of vesting choirs in American Episcopal churches appears to have been originated. Cutler was the author of many musical compositions, and his arrangement of the hymn, 'The Son of God Goes Forth to War,' is widely known.

Cutler, Manasseh, American Congregational clergyman: b. Killingly, Conn., 3 May 1742; d. Hamilton, Mass., 28 July 1823. He was graduated at Yale in 1765, became a lawyer in 1767, and Congregational minister in 1771, and a chaplain in the Revolutionary army in 1776. After the war he helped form the Ohio Company, which settled Marietta in 1788, and had a leading part also in the formation of the State of Ohio, being credited with drafting the noted «Ordinance» of 1787. He was a member of Congress from Massachusetts 1800–5. He was also a botanist of distinction, describing 350 species of plants native to New England. Consult 'Life, Journals, and Correspondence of Manasseh Cutler' (1888).

Cutler, Timothy, American clergyman: b. Charlestown, Mass., 1683; d. Boston August 1765. He was graduated at Harvard in 1701; was a Congregational pastor at Stamford, Conn., 1710–19, when he became rector of Yale College. In 1722, convinced of the non-validity of Congregational ordination, he became a believer in episcopacy, and was dismissed by the trustees of Yale. Going to England, he was ordained by the Bishop of Norwich in 1723, was appointed a missionary of the Society for the Propagation of the Gospel, and taking charge of Christ Church, Boston, Mass., 1723, remained its rector until his death. He was throughout his later life one of the most influential of the colonial clergy.

Cutlery, Manufacture of. Cutlery broadly considered may include any article with a cutting edge. From a trade and makers definition, it comprises only pocket knives, table knives, razors and scissors. These are four distinct and separate trades, and although all four are often carried on by one firm, many manufacturers confine themselves to one branch only. Pocket knives generally include all kinds of spring knives, hunting knives, etc., and table knives include carvers, butchers' and cooks' knives. In each of the four divisions of the cutlery trade, the process of manufacture is somewhat similar.

Pocket Knives.— In olden times the same man made the blades, ground and finished, and fitted them to the handles, which he also made. With the development of the factory system, each branch became divided into three separate trades, viz., forgers, grinders, and cutlers or hafters. Taking the process of manufacture in spring knives as typical of all branches, and as still followed in Sheffield and elsewhere in the old established way and carried on by those firms who have maintained a reputation for quality, many methods have been introduced in different countries to substitute various machine processes for producing blades other than forging by hand, but nothing to equal the hand-forged article has been produced. The steel, which should be converted from the finest brands of Sweedish iron, is melted, cast into ingots, then hammered into bars and rolled in strips of width and thickness suitable for the sizes of blades required. The blade maker or forger takes one of these strips, cuts it into convenient lengths, heats to a warm red a portion of one end, sufficient for a blade, in a clean fire of small coke, roughly hammers out the required blade and chops off from the string of steel just enough for this and the tang (*i. e.* the part of the blade by which it is fastened into the haft). This process is called mooding, the workmen making as many as required for the quantity he is making, or for his day's work. He then reheats these moods separately, and with a hammer on the various bosses fixed in his anvil, or stithy, works the tang into the required shape; the other end, the cutting portion of the blade, is then reheated, the nail mark put in on a boss for that purpose fixed in the anvil, the sides hammered flat, and edge of blade as thin as possible. This is all done at one heat, and called smithing. It is this hammering from hot to cold that imparts the lasting cutting qualities, provided the blades are made of good steel. The blades then go to the grinder, who «lays on» the tangs, *i. e.* he grinds off the rough surface on that part on which the name is put; this is done by the marker with a punch used either by hand or in a fly. The blades then go back to the forger to be hardened and tempered. Each blade is heated separately and dipped in water, after which it is of a whiteish gray color, having shaled — *i. e.* a thin outer surface has peeled off. The blade is now quite brittle, and requires tempering; this is done by slowly heating on a steel plate over the same fire as used for forging. The degree of temper required is judged by the color and goes from a light straw to a darker ditto, reddish brown, or blue

according to the different styles of blades and purposes for which they are used, pen blades being generally left a straw color, and pockets a reddish brown. The blades are now ready for the grinder. This man sits on a horsing,—a kind of wooden saddle,—partly under and in front of which between his legs runs a stone in a trough with sufficient water in the bottom to just catch the surface of the stone and keep it constantly wet. Grindstones vary in diameter according to the class of work to be done, and run from about 14 inches for small pen blades, to 5 feet for carvers, but the grinding of each is restricted to its separate trade. The blades are set in (put into handles) in the rough ground state. In some cases in jack knives the grinder also finishes the blades, but generally this is done by others after the blades have been fixed in the hafts by cutlers. The cutler is given the necessary parts, blades, springs, scales, and covering, and works these into the knife. Springs are filed out of sheet steel, except in the case of pruners and large jack knives, for which they are often forged by a spring forger; and is another separate trade for the workman. The spring forger also makes some kinds of scales, viz., those used for large pruning and sporting knives, and various articles other than blades that are put into knives. Generally the scales are made by scale makers, another subsidiary trade, and the covering of stag, ivory, pearl, horn, bone or wood of various kinds comes from the cutters of these several materials. The cutler works to templates, or as he calls them "fitting things." This is the most complex and ingenious of the three branches in the trade; he has to bore and file each spring to his measure, harden temper and finish the same, bore tang of blades, and fit to measure and finish the edges—fit to measure plate and bore the scales, put on the covering after the necessary preparing, then nail the several parts together and get up the haft. This is done by different degrees of filing, and grinding on glazers (wooden wheels bound with leather and dressed with glue and emery of various grades). Stag is finished on brushes, the smooth coverings on buffs or dollies. The buffs are wheels similar to glazers, with softer leather, dressed with oil and rotten-stone, and the dollies are made with layers of cotton cloth between side plates, and dressed as buffs. The cutler having made up the various parts into knives, the blades, being unfinished, have to go back to the grinder or finisher to be either glazed or polished, as required. For this, handles are wrapped up in paper or anything else that will keep them clean, and the blades left open—not more than one at each end at once. The pocket blades are whittened *i. e.* reground on a harder stone than that used for grinding, then glazed, first on a rough and then on a finer glazer, and buffed to give a brighter finish,—if required polished they go from the fine glazer to a small wooden wheel bound with leather and dressed with crocus, and which runs much slower than grindstones or glazers. With pen blades of any quality the sides are lapped instead of glazed, *i. e.* the wheel on which this is done is bound with lead (run on in a mold) instead of leather; by this means a truer and better cutting edge is secured. The cheaper qualities of pen blades are finished on the glazers, either leather bound, or made of wood, without any covering, but blades so finished are inferior to those that are lapped. If polished the pen blades go from the lap to the polish as in the case of pocket blades. After finishing, the blades are wiped and greased, joints cleaned, and the knives then go to the whetter, who rubs the edges on a hone (oil stone) to remove the rough edge left by finishing. This is often done by women or girls, but the better work is always done by men. The whetter rubs the blade backwards and forwards on his stone at a slight angle so as to leave a thin white line called the kennel along the edge on either side of the blade. The knives are then wiped by women, joints oiled, wrapped up and put in boxes, and are ready for market.

Table Knives.—The process of making these is similar to that of spring knives; though the workmen employed are entirely different. The trade comprises three branches of men, forgers, grinders, and cutlers, as in spring knives. The men in one line of the cutlery trade never work at any other of the sections, *i. e.* spring knife men in any of the three branches do not work at table knives, razors, or scissors in the same branch; that is to say, a blade forger in the spring knife section does not make table blades, razors, or scissors. The better table knives are made from shear steel, and are hand forged; this is too expensive for the greater part of the trade, so cast steel is used and forged with machines called goff hammers; cheaper blades still are filed out of sheet steel. The table knife, requires a different edge from a pocket knife, which has a smooth stiff edge, but for cutting soft substances such as meat, a thin rough edge is wanted. This is only obtained in perfection from shear steel, and though cast steel may answer fairly well for table knives, it is not satisfactory for carvers. Shear steel is made by welding together several lengths of blister steel (*i. e.* iron simply converted into steel). When these come from the converting furnace they are cut into shorter lengths about three and one-half feet long, and will be about three and one-half inches wide by one and one-half inches thick. Six of these are put together in a clamp at one end; the other end heated, worked into a bar under a steam hammer; the same is done with the other end, and the whole reduced by hammering to a bar about one and one-half inches by one inch; this is called single shear. For double shear the same bar is bent over, bringing the two ends together, and put through the same process of hammering again. The bars are then rolled to the sizes required for forging, The forgers work double handed, one called the striker, the other the maker. They stand opposite each other, hammering at the same blade at the same time, striking alternately, the maker holding the blade with one hand, and using a hammer in the other, the striker using a two-handed hammer. When the maker is finishing each blade (smithing it) the striker will be hardening and tempering. In hand-forged blades, the cutting part of the blade only is made of steel; the tang (that part which goes in the handle) and the bolster (the thick part of blade where it joins the handle) are of iron, which is welded on to the steel by the forgers in process of making. The blades first being mooded (rough forged) iron for tang and bolster welded

on, tanged, smithed, hardened and tempered, the table knife grinder grinds and finishes the blades right out before they are set in the haft by the cutler. They are afterwards buffed again to remove scratches, and whetted on a dry fine sandstone. In a cheaper but less effective way this whetting is done on dry grind-stones.

Razors.—These are made of cast steel of fine and hard quality, but not as tough as that used for spring knives, as they are required to stand no bending strain. They are mostly hand forged, but many are now stamped in dies under power hammers, which process is found more satisfactory for razors required to be hollow-ground, as they can be stamped hollow; but for flat sides, of which large quantities are made, the hand forging is more effective. The grinding of razors is done in the same manner as spring knives, the blade being finished (glazed or polished) and etched if so required, before the fitter called the setter in, puts them in hafts. The hollow-grinding of razors is quite a fine art. Until a few years ago this was done on stones of various sizes down to some of not more than one-half inch in diameter. Emery wheels are now almost universally used for this purpose. Quite a variety of patent machines are now used for hollow-grinding. Razors are whetted on finer and harder stones than spring knives, and afterwards stropped, wiped, and done up in cases ready for use.

Scissors.— The best are hand forged, but good ones are also made from blanks flied out of sheets of cast steel and stamped in dies. This is becoming the general process, and, provided the material is good, the result gives all that is required. In large sizes of scissors only the cutting edge is made of steel, which is welded on to iron; these are called "shot scissors." In common and cheaper qualities the blanks are cast, *i. e.* the metal is run into molds. The other processes of grinding, finishing, and fitting scissors are somewhat similar to those described for knives.

The four trades described constitute what is technically included under the term of cutlery, but there are certain side lines to some of them which also come under that heading, for instance, some spring knife manufacturers will also make tea pruners, farriers' knives, and some kinds of surgical knives; in other instances, each of these may be carried on as separate trades, but all will be included under the description of cutlery. See HARDWARE.

I. A. E. PAINE,
Managing Director, George Wostenholm & Son, Ltd., Sheffield, Eng.

Cutlips, one of the common names of the fish, *Lagochila lacera,* found in some of the rivers of the Mississippi Valley. The peculiar formation of its lower lip, which is divided into two parts, suggests the other common names it bears: splitmouth, harelip, and rabbit-mouth.

Cuttack, kŭt-tăk', India. 1. An executive district in the lieutenant-governorship of Bengal, province of Orissa; area 3,633 square miles. On the coast is extensively manufactured the best and whitest salt made in India. Pop. 1,937,671. 2. The capital of the district of Cuttack, on the Mahanadi River, 220 miles south of Calcutta, is chiefly noted for filigree-work in gold and silver. Pop. about 50,000. 3. The Cuttack Mehals are subject to 21 rajahs, tributary to Great Britain, and have an area of 14,387 square miles. Pop. 1,696,710.

Cut'tage, the propagation of plants by means of slips or cuttings which are detached parts of roots, stems, leaves, etc. This form of asexual or bud-propagation is found in nature among willows, poplars, and many other trees and shrubs, especially such as are readily broken by wind and drop their twigs and branches into streams and ponds with muddy shores. Artificially, it is one of the oldest methods known and is of wide importance, ranking with graftage (q.v.) and seedage. The advantages of cuttage are that, with the rare exceptions due to bud variation, plants may be propagated true to variety or species in very great number, and the cost of production of the kinds commonly so propagated is small when compared with certain other methods such as division and layerage, in which cases roots are developed before the removal of the parts which become new individuals. An idea of the scope of this practice may be obtained from the fact that, except in the production of new varieties which are obtained by means of seeds, the great majority of florists' perennial plants such as roses, carnations, violets, chrysanthemums, are so obtained, as are also many fruit plants such as gooseberries, currants, grapes, and pineapples, though in the last instance other methods are also used to a large extent.

The methods for making the cuttings "strike" root are very various. Some species such as currant and gooseberry will soon produce roots if plunged in moist soil out of doors; others must be grown under glass, often with extra degrees of heat in the soil (bottom heat), in propagating boxes (glass-covered frames upon the greenhouse benches), and other devices, as well as specially favorable soils, etc. The methods of making the cuttings also differ widely with the species of plant and the part used, as the following classification will show:

CUTTINGS.

Roots or Rootstocks	Stem	Leaf
Short, under glass, Dracæna.	Growing wood, Soft-Fuchsia. Hard-Rubber plant.	Entire, laid flat on surface, Begonia.
Long, in open air, Blackberry.	Ripened wood, Long, in open air, Currant.	Divided, Begonia Rex.
By tuber cuttings, Potatoes.	Short, under glass, Yew.	Bulb Scales, Lily.

Cutter, Charles Ammi, American librarian: b. Boston, Mass., 14 March 1837; d. Walpole, N. H., 7 Sept. 1903. He was graduated at Harvard in 1855, and from its Divinity School 1859. He was assistant in the Harvard Library 1861–8; librarian of the Boston Athenæum 1869–93; and of the Forbes Library, Northampton, Mass., since 1894. He has devised and published an admirable system of classification for books, known as the 'Expansive Classification' which has been adopted by many libraries, especially

those of colleges and learned institutions. He edited the 'Library Journal' 1881–93, and has published: 'Rules for a Printed Dictionary Catalogue' (1876; 3d ed. 1891), and prepared the 'Catalogue of the Library of the Boston Athenæum' (5 vols., 1874–82).

Cutter, Ephraim, American physician: b. Woburn, Mass., 1 Sept. 1832. He was graduated at Yale University in 1852; practised medicine in his native city till 1875, in Cambridge and Boston till 1881, when he removed to New York and began practice there. He has invented a large number of surgical instruments; contributed over 400 articles to literature on scientific subjects, including microscopic medicine, laryngology, chronic diseases, and general medicine; and became a member of the Massachusetts Medical Society in 1856, and of the American Medical Association in 1871.

Cutter, George Washington, American poet: b. Massachusetts 1801; d. Washington, D. C., 24 Dec. 1865. He practised law in Kentucky until 1845; served as a captain in the Mexican war; became active in politics, and received a treasury clerkship. His poems are nearly all included in 'Buena Vista, and Other Poems' (1848); 'Song of Steam, and Other Poems' (1857); 'Poems, National and Patriotic' (1857).

Cutter, a name given to two kinds of small vessels. The first is one of the supplementary small-boats of a man-of-war equipped for both rowing and sailing. The cutters used by yachtsmen and by pilots, and revenue cutters are built with especial reference to speed, and have a single mast, and a "single-stick" straight-running bowsprit that may be housed in-board in dirty weather. They are much like the sloop in rig. The hull of the cutter is very deep and narrow, being almost V-shaped, with an almost perpendicular rise from the floor to the bulwarks, and a keel heavily loaded with lead. In heavy weather, working to windward, the cutter shows to best advantage. (See YACHTING.) A light sleigh with a single seat is called a cutter in some parts of the country.

Cutting, a detached part of a plant used for propagation.

Cuttle, Captain, a character in Dickens' 'Dombey and Son.' He is a retired merchant-captain with a hook in place of a right hand. He received and cared for Florence Dombey.

Cuttle-bone, the dorsal plate of *Sepia officinalis,* formerly employed in medicine as an absorbent, but now used for polishing wood, painting, varnishing, etc., as also for pounce and tooth-powder.

Cuttlefish, a common name for the Cephalopods, but originally applied to a member of the genus *Sepia.* In the United States it is restricted to the octopods (q.v.). The cuttlefish proper, *S. officinalis,* measures from 6 to 10 inches in length, and its color varies from pale-gray to dark-brown or neutral tints. The body is oval, flattened from above downward, and contained in a tough muscular sac (mantle), which expands along the whole of either margin into a narrow fin. The integument consists of a single layer of cells, lying upon connective tissue, in which are imbedded "chromatophores," or cells charged with various colored pigment-granules. By expansion of the cell the pigment is diffused, and by its contraction concentrated, hence the rapid flashes of changing color for which the *Cephalopoda* as a whole are so remarkable.

The head is broad, with a complex cartilage which protects the central nervous system, and a bright green eye. The front of the head is occupied entirely by the mouth, and the bases of the arms, of which there are 10, 8 having suckers on the extremity in 4 longitudinal rows. The two remaining arms, known as "tentacles," occupy the interspaces between the ventral arms and those next to them. They are twice as long as the others, and can be withdrawn into pockets situated beneath the eyes and carried in this position when not in use. The mouth, situated in the centre of the roots of the arms, is surrounded by a lip with seven prominent angles, which bear small suckers in some species.

On the lower side, between the muscular sac and the body proper which contains the viscera, is a hollow space, the "branchial" or "mantle-cavity," containing the siphon, the intestines, kidneys, genital organs, and gills. Respiration is carried on by rhythmic contractions of the mantle, in consequence of which water enters at either side, passes over the gills, and is expelled by the siphon; this takes place about 70 times in a minute. On the dorsal side of the animal, immediately beneath the integument, is a closed sac which contains the cuttle-bone. Speaking generally, this may be said to be of an elongated spoon or boat shape; it consists of a horny lamina. Lying parallel to the terminal portion of the intestine is the "ink-bag," a hollow gland opening near the anus, and furnishing a deep-brown fluid, which is ejected by the animal when alarmed in order to conceal its retreat. The pigment known as "sepia" is prepared from it. The heart is situated posteriorly, and consists of a pear-shaped sac which receives on either side a vein from the gills, dilated just before its termination into a muscular contractile antechamber or auricle.

The nervous system consists of the three pairs of ganglia common to the mollusca, concentrated round the œsophagus.

Of the sense organs the eyes are the most conspicuous. They occupy depressions in the head cartilage.

The ears are a pair of small closed vesicles, imbedded in the head-cartilage, and supplied by nerves which, though apparently springing from the pedal ganglia, really have their origin in the cerebral. A ciliated pit, usually considered olfactory, lies behind each eye. The sexes are separate. The testis and ovary are both single and situated in the hinder part of the body; the latter lies in the visceral sac or pericardium above described, the former in an almost closed diverticulum of it. The eggs have a tough capsule, with a projection at one end and a kind of handle at the other by which they are attached in bunches to a twig of seaweed or other similar substance.

Cuttlefish are found in littoral regions or in moderately deep water; ordinarily they rest horizontally on or near the bottom, the fins gently undulating, the tentacles retracted, and the arms depressed. Progression may take place by means of the fins with considerable rapidity in either direction, the funnel being turned so that the stream of water issuing from it

assists in propulsion; rapid darts backward when the animal is alarmed are brought about either by the sudden ejection of water through the siphon, or by spreading out and reuniting the arms. See CEPHALOPODA; SQUID.

Cutty Stool, the stool of repentance, a seat formerly set apart in Scottish kirks, on which offenders against chastity were exhibited before the congregation and submitted to the minister's rebukes before they were readmitted to church privileges.

Cuttyhunk, Mass., an island in Buzzard's Bay. It was on this island that Bartholomew Gosnold landed, on 25 May 1602, and there established the first settlement of white men in that part of the world. He named the island after Queen Elizabeth, calling it Elizabeth Isle. The settlement did not continue a full month before it was abandoned, the colonists returning to England. It is now used chiefly as a place of summer resort.

Cuvier, Georges Chrétien Léopold Dagobert, zhörzh krā-tē-ĕn lā-ō-pōld dä-gō-bār kü-vē-ā, BARON, French naturalist: b. Montbéliard, France, 23 Aug. 1769; d. Paris 13 May 1832. After finishing his education at Stuttgart he accepted the situation of tutor in a Protestant family in Normandy. The Abbé Texier, whom the troubles of the time had driven into exile from the capital, introduced him by letter to Jussieu and Geoffroy. Several memoirs, written about this time, and transmitted to the latter, established his reputation and procured his admission to two or three of the learned societies in Paris. In 1800 he was appointed successor to Daubenton as professor of natural history at the College of France, and in 1802 succeeded Mertrud in the chair of comparative anatomy at the Garden of Plants. From that time he devoted himself steadily to the studies which have immortalized his name.

Cuvier's 'Lessons in Comparative Anatomy,' and the 'Animal Kingdom,' in which the whole animal kingdom is arranged according to the organization of the beings of which it consists, have raised him to the pinnacle of scientific fame, and established him as the first naturalist of his time in the world after Linnæus, the celebrated Swedish botanist.

His numerous memoirs and works on these subjects show a master-mind in the study of zoology; and extending the principles laid down in his comparative anatomy to the study of palæontology, he has been enabled to render immense service to geology. Starting from the law that there is a correlation of forms in organized beings — that all the parts of each individual have mutual relations with each other, tending to produce one end, that of the existence of the being — that each living being has in its nature its own proper functions, and ought therefore to have forms appropriated for that function; and that consequently the analogous parts of all animals have received modifications of form which enable them to be recognized — he was able to ascertain from the inspection of a single fossil bone, not only the family to which it ought to belong, but the genus to which it must be referred. Even the very species of animal was thus to be made out, and the restoration of its external form as it might have lived and died became in his hands an object of certainty and precision. His 'Animal Kingdom' has been frequently translated, and forms the basis of all arrangements followed at the present time. Cuvier filled many offices of great importance in the state; particularly those connected with educational institutions. Napoleon treated him with much consideration; Louis XVIII. and Charles X. advanced him to honor; and Louis Philippe raised him to the rank of a peer of the realm. See Candolle, 'Notice sur la Vie et les Ouvrages de G. Cuvier'; Lee, 'Memoir of Baron Cuvier' (1833); Lomenie, 'G. Cuvier, par un homme de rien' (1841); Florens, 'Cuvier; Histoire de ses Travaux' (1845); de Blairville, 'Cuvier et Geoffrey Saint Hilaire' (1890).

Cuvillier-Fleury, Alfred Auguste, French author: b. Paris 18 March 1802; d. there 18 Oct. 1887. He was educated in the Collège Louis-le-Grand, became private secretary to Louis Bonaparte, ex-king of Holland, in 1819; tutor to the Duke of Aumale in 1827, and entered the staff of the *Journal des Dèbats* in 1834. He was made a member of the Academy in 1866. Among his works are: 'Voyages et Voyageurs' (1854); 'Etudes, Historiques et litteraires' (1854); 'Nouvelles Etudes' (1855); 'Dernières etudes historiques et litteraires' (1859); 'Historiens, Poètes et Romanciers' (1863); 'Etudes et Portraits' (1865); etc.

Cuxhaven, kooks'hä-fĕn, Germany, a fortified seaport at the mouth of the river Elbe, in a detached portion of territory belonging to Hamburg. The old harbor is one of the safest on the coast, is often resorted to in cases of danger. Many passengers for foreign parts embark at Cuxhaven, which is annually rising to greater importance. Here vessels generally take pilots to go up the river to Hamburg and other places. These pilots are privileged, and by their statutes are compelled always to keep pilot-vessels out at sea, with men ready to conduct any vessel which may demand assistance. Pop. (1901) 7,000.

Cuyabá, koo-yä-bä', Brazil, the capital of the state of Matto Grosso, situated on the Cuyabá River, a part of the Paraguay River system. It was founded early in the 18th century by adventurers from São Paulo, in search of gold. The climate being somewhat more healthful than that of other portions of the state, it has retained a moderate degree of prosperity since the mining industry terminated. A military arsenal and barracks are located here. From Rio de Janeiro in a direct line the distance to Cuyabá is about 840 miles, but only one third of the railroad has been completed which is to connect Cuyabá with the coast, through São Paulo. At the present time transportation is mainly by way of the Paraguay and La Plata rivers to Buenos Ayres; thence by the Atlantic to the national capital — a total distance of about 3,720 miles. Pop. a little more than 8,000. See MATTO GROSSO.

Cuyler, kī'lèr, **Theodore Ledyard,** American Presbyterian clergyman: b. Aurora, N. Y., 10 Jan. 1822. He was graduated at Princeton College in 1841 and at Princeton Theological Seminary in 1846. From 1860 to 1890 he was pastor of Lafayette Avenue Presbyterian Church in Brooklyn, resigning to devote his time to literary and reform work. In 1900 he sup-

ported McKinley for the presidency while opposing imperialism. He has written: 'Newly Enlisted'; 'Christianity in the Home'; 'Cedar Christian' (1863); 'The Empty Crib' (1868); 'Heart Life' (1871); 'From the Nile to Norway' (1881); 'Stirring the Eagle's Nest' (1890); 'Beulah Land'; 'Mountain Tops with Jesus'; Our Christmas Tides' (1904); etc. He has been a constant contributor to the religious press and besides his published volumes has written some 3,000 articles and letters in newspapers and magazines, many of these having been reprinted in England. At the observance of the 25th anniversary of his Brooklyn pastorate it was stated that he had admitted into his church by membership 3,610 persons.

Cuyo, koo'yō, Philippines, a town and the capital of the province of Paragua, situated on the southwestern coast of the island of Cuyo, Cuyos group. The town is well built, and has an important trade. It is protected by a fort built on a land spit near the town. Pop. 8,258.

Cuyos Islands, Philippines, a group of 47 islands lying south of the island of Mindoro, and east of Palawan; total area, 63 square miles. The most important island of the group is Cuyo, 8 miles long; area; 20 square miles. The islands, with the exception of Cuyo, are infertile, and there is but little manufacture; the chief industry is the gathering and preparation of edible birds' nests and trepang. By the civil government act of 1902, these islands were made a part of the province of Paragua, Palawan.

Cuyp, koip, or **Kuyp, Albert,** Dutch artist: b. Dordrecht 1605; d. there 1691. He was a son of Jacob Cuyp (q.v.), and excelled in the painting of cattle grazing or reposing, moonlights, wintry landscapes, still waters with ships, horse-markets, hunts, camps, and cavalry fights; and in rendering effects of warm golden sunlight he is without a rival. During his lifetime and long after, Albert's pictures, though in many respects equal to those of Claude, were held in little estimation. Opinion, however, has now changed regarding them, and a fine example of his art has realized over $25,000.

Cuyp, Benjamin, Dutch artist: b. Dordrecht 1608; d. 1672. He was a nephew of Albert Cuyp (q.v.), and became a member of the guild in Dordrecht in 1631. He painted biblical pieces in Rembrandt's style, and familiar scenes of country life. His best works are in the manner of Teniers.

Cuyp, Jacob Gerritse, yä kōb gĕr-rēt'sē, Dutch painter, commonly called the Old Cuyp; b. Dordrecht 1575; d. 1651. Jacob Cuyp's representation of cows and sheep, battles, and encampments, are clever, but his fame rests principally on his excellent portraits. His coloring is warm and transparent; his manner, free, and spirited. Cuyp was one of the four founders of the Guild of St. Luke at Dordrecht.

Cuyuni, koo-yoo'nē, a river of South America, rises in Venezuela, flows first north, then east, through British Guiana, and into the Mazaruni. It has numerous rapids and falls; the lowest is 30 miles above the mouth.

Cuzcatlán, kooz-kät-län', Salvador, C. A., an Indian town, capital of a nation which occupied the territory represented by the modern departments of San Salvador and Cuscatlán. It was taken by the Spaniards under Alvarado in 1524. See Cuscatlán.

Cuzco, kooz'kō, Peru, a department in the southeastern part of the republic, bounded by the province of Loreto on the north, by Bolivia on the northeast and east, by Puno and Arequipa on the south, and by Apurimac, Ayacucho, and Junin on the west. Its area is 27,285 square miles. Within its limits are found nearly all varieties of temperature, with the corresponding products. The fertile valleys of the Vilcamayo enjoy an Italian climate; toward the Bolivian frontier there are vast tropical forests, abounding in all the productions of the torrid zone; on the slopes of the Andes are plains covered with pasture or crops of cereals; and still higher up on the table-lands and peaks are large flocks of vicuñas and alpacas. In general, the easterly regions have the characteristics of the upper Amazon country, while the southwest is extremely mountainous, with beautiful and healthful elevated plains or valleys, like that in which the city of Cuzco is situated. Pop. of the department about 240,000.

Cuzco, Peru, the most famous ancient city of South America. Situated in lat. 13° 31′ S., and lon. 73° 3′ W., Cuzco is at an elevation of 11,380 feet above the sea (compare Mount Washington, 6,288 feet, and Mont Blanc, 15,779 feet), and its climate is temperate; but in winter snow often falls. It was the chief town of the Inca tribe (q.v.). The writings left by Spanish conquerors and early chroniclers, upon which subsequent accounts have been based, not only preserved the Indian myths but also added some fanciful details in regard to the place, the inhabitants, and their institutions. According to such myths and accounts, the founder of the city was Manco Ccapac, son of the sun-god; strong walls, we are told, surrounded it, and in its midst was a great square, from which started four roads binding together the "empire of the four quarters of the world" (in the native tongue, "Tahuantinsuyu"), the first road leading to Puitu, the modern Quito, the second over the Andes, the third to Chile, and the fourth to the ocean. The temple of the sun, with the surrounding dwellings for priests and virgins of the sun, occupied a district of the city called "The Golden." Five mighty walls enclosed that sacred place. The temple itself was circular in form. Its chief hall, dedicated to the sun-god, contained an image of the sun made of beaten gold; the door-posts were of gold; all the walls were covered with disks of the same metal; and the mummies of the Incas ranged beside the god were decked out with golden ornaments. A door encased in silver led to a chapel dedicated to the moon-goddess, sister and wife of the sun-god. Here the images and furnishings were of the white metal, and the mummies of the wives of the Incas were decorated with silver. A part of the site of the temple is now occupied by the Church of S. Domingo. The Sacsahuaman fortress overlooked the city from a hill 250 metres high. It had a triple wall, built of enormous stones. Through deep ravines on either side of the Sacsahuaman hill flow the little rivers of Huatanay and Rodadero, the former passing beneath the houses on the west side of the square, down through the centre of a broad street, where it is crossed by numerous stone bridges, and eventually uniting with the Roda-

dero. The main part of the old city was built between these two rivers; and even to-day the houses there commonly show the massive masonry of the Inca architecture in their lower portions, though having a modern superstructure. Now, as formerly, the streets run at right angles. The government established by the Incas, though in form a despotic theoracy, was relatively mild and patriarchal. Nowhere and never have there been chiefs of state so successful in monopolizing all power, all initiative. Accordingly, when the Spanish conqueror Pizarro captured Inca Atahulapa, the people were incapable of effective resistance. Atahualpa's successors were Huascar and Manco. The former was slain; the latter was induced by promises of friendship to lead the Spaniards into Cuzco (15 Nov. 1533). An enormous booty was obtained by despoiling the temples and palaces. Besides gold and silver, the common soldiers received 200 slaves each, and the sacred sun-maidens were treated as a part of the loot. In 1536 the last of the Incas, Manco, besieged the city unsuccessfully. It remained the principal Spanish stronghold for a long time, though Pizarro founded Ciudad de los Reyes (Lima) 6 Jan. 1535. Extremely interesting are the remnants of the fortifications, temple, etc., some of which are constructed of huge masses of rock (one piece 16 feet in height; others 10 and 12 feet) of irregular shape, yet made to fit exactly one into the other with minute accuracy, as in mosaics. Such works, constructed before 1370, are scarcely surpassed by any in the world in respect to their solidity and the skilful workmanship they attest. Among the public buildings are the Cabildo, the university, library and museum, etc. The city has suffered from lack of means of transportation and communication. Only in the last few years has an effort been made to connect it by railroad with the Titicaca region. It has shrunken in trade as in population. Gold and silver work, leather, sugar, cotton, linen and wool are produced to a limited extent. The inhabitants at the time of the conquest numbered perhaps 100,000; a century ago about 50,000; at present about 30,000.

Cyanide Process. See GOLD.

Cyanides, sī'ą-nīdz or sī'ą-nīdz. See HYDROCYANIC ACID.

Cyanin, sī'ą-nĭn, the blue coloring-matter of certain flowers, as the violet and corn-flower.

Cyanite. See KYANITE.

Cyanogen, sī-ăn'ō-jĕn, a colorless poisonous gas which liquefies at — 25°, or under a pressure of four atmospheres at 20°, and at — 34° becomes crystalline. It burns with a peach-blossom-colored flame, forming CO_2 and nitrogen; water dissolves four volumes, and alcohol 23 volumes of the gas. It is very poisonous, and smells like prussic acid. Cyanogen gas passed into strong aqueous hydrochloric acid is converted into oxamide. Nascent hydrogen from tin and hydrochloric acid converts cyanogen into ethylene-diamine, $N_2(C_2H_4)''H_4$. A solution of cyanogen in water turns dark and deposits azulmic acid, $C_4H_5N_5O$, and the solution contains hydrocyanic acid, urea, and oxalate and formate of ammonia. Cyanogen dissolves in an aqueous solution of potash, forming cyanide and isocyanate of potassium. It may be regarded as the nitril of oxalic acid. Dry ammonia gas and cyanogen combine, forming **hydrazulmin,** $C_4N_6H_8$. Small quantities of cyanogen are formed during the distillation of coal.

Cyanometer, sī-ą nŏm'ĕ-tĕr ("measurer of blue"), the name of an instrument invented by Saussure for ascertaining the intensity of color in the sky. It consists of a circular piece of metal or pasteboard, with a band, divided by radii into 51 portions, each of which is painted with a shade of blue, beginning with the deepest, not distinguishable from black, and decreasing gradually to the lightest, not distinguishable from white. It is used in the open air, and the observer holding it up between himself and that part of the air whose color he wishes to ascertain, and in such a position as to secure its being strongly enlightened without receiving the direct rays of the sun, turns it gradually round on its own plane till he perceives an exact similarity between the tint of the instrument and the tint of the sky. The number of that particular tint as marked on the instrument marks the intensity of color in the sky at that particular period.

Cyanophyceæ (Gr. "dark-blue"), the lowest group (blue-green) of *Algæ* (q.v.). Their color is caused by the diffusion of phycocyan, a blue pigment, throughout their cell-contents. In this group no sexual reproduction has been observed, the only reproductive means known to exist in it consisting of spores and hormogonia of a non-sexual character.

Cyanose, sī'ą-nōs, native sulphate of copper ($CuSO_4$, $5H_2O$), met with generally in stalactitic or reniform masses, but sometimes in well-defined crystals. It is dark-blue, translucent, vitreous, brittle, readily soluble in water, and with a most disagreeable metallic taste.

Cyanosis, sī-ą-nō'sĭs, a condition of diminished oxidation in the blood, causing lividity of the skin, blueness of the lips, and symptoms of weakness and fainting. It may be a permanent affection, such as is seen in blue babies, in whom the venous blood obtains access to the arteries without passing through the lungs to be oxidized; or it may be a temporary condition due to choking, to excessive coughing as in false croup, or in true diphtheria. It also results as a temporary condition in poisoning by means of a number of the newer drugs used for headaches and vague pains, such as acetanilid and the like. It may also result from coal-gas poisoning, and a large variety of other forms of poisoning. Removal of the source, if possible, fresh air, oxygen, artificial respiration, are useful in the treatment of the condition. The congenital varieties are unmodifiable.

Cyan'otype Process, a method whereby photographic pictures are obtained by the use of a cyanide. This process is in common use by architects and engineers for copying plans, producing an image with white lines on a blue ground. Sensitive paper is made by brushing it over with a solution of ferric oxalate (10 grains to the ounce); it is then exposed under the positive and treated with a solution of potassium ferricyanide, by which the image is developed. The color of the ground is deepened by subsequent washing with solution of potassium bisulphate.

Cyanuric (sī-ą-nū'rĭk) **Acid** (from "cyanogen" and "uric"), an organic acid having the

formula $C_3N_3O_3H_3$, and obtained by the dry distillation of uric acid. It is a polymer of cyanic acid, CNOH, and may be obtained, along with another polymer of unknown molecular weight called cyamelide, by the spontaneous polymerization of cyanic acid. To obtain it in this way, potassium cyanate, CNOK, is treated with hydrochloric acid in the presence of ether, the mixture being well shaken. Potassium chloride and cyanic acid are formed, the latter polymerizing at once into the two compounds mentioned above, the cyanuric acid that is formed being taken up by the ether, from which it may afterward be recovered by evaporation. Cyanuric acid forms colorless efflorescent crystals which contain two molecules of water when deposited from solution in water. The hydrous crystals have the form of rhombic prisms; but anhydrous crystals, octahedral in form, are also known. Cyanuric acid dissolves in hot nitric, hydrochloric, or sulphuric acid, there being no decomposition unless the action is prolonged. When heated it becomes converted into cyanic acid, this reaction being one of the tests that are employed for its detection.

Cyath'ea, a genus of arborescent ferns, order *Polypodiaceæ,* characterized by having the spores, which are borne on the back of the frond, enclosed in a cup-shaped indusium. There are many species scattered over the tropical regions of the world. *C. medullaris* is a fine New Zealand species of comparatively hardy character. The soft, pulpy, medullary substance in the centre of the trunk is an article of food somewhat resembling sago. This species and the South African *C. dealbata* are cultivated as ornamental plants. *C. arborea* is a West Indian species.

Cyathom'eter, a recently invented apparatus for determining the level and volume of liquids in closed vessels. It is adapted to bottles and to stationary vessels and is designed especially to prevent fraud in the retail trade in valuable liquids. The apparatus consists of a glass tube fluted internally, of a glass telltale or float provided with two straight springs, and of a solid ball. The tube is suspended in a bottle arranged for the purpose at the time of manufacture, from a band of twisted wires of inoxidizable metal, the extremities of which, after passing through the neck, are united and provided with a lead seal. When a full bottle is provided with the cyathometer, the telltale is at the upper part of the tube. If a certain portion of the contents be poured out, the levels of the bottle and tube will descend together and the telltale will constantly follow them. If, on the contrary, any quantity whatever of liquid be added, the levels will rise, but the telltale, held by its springs, which are braced against the flutings of the tube, will remain where it was before the addition. It is therefore submerged and marks the precise point where the addition or substitution began. Any fraud will be revealed by the telltale at the very moment at which it occurred. When the cyathometer is adapted to vats, tanks, casks, etc., the telltale consists of a float and sleeve placed in contact, and each carrying three or four springs pointing in contrary directions, those of the float engaging with the sleeve. The apparatus lends itself also to the control of movable receptacles of large capacity.

Cybele, sĭb'ĕ-lē or sīb-ē'lē, a goddess of the Phrygians, like Isis, the symbol of the moon, and what is nearly connected with this, of the fruitfulness of the earth, for which reason she is confounded with Rhea, whose worship originated in Crete, and in whom personified nature was revered. According to Diodorus Cybele was the daughter of the Phrygian king Mæon and his wife Dindyma. At her birth her father, vexed that the child was not a boy, exposed her upon Mount Cybelus, where she was nursed by lions and panthers, and afterward found and brought up by the wives of the herdsmen. She invented fifes and drums, with which she cured the diseases of beasts and children, became intimate with Marsyas, and fell violently in love with Atys. She was afterward recognized and received by her parents. Her father discovering her love for Atys had him seized and executed, and left his body unburied. The grief of Cybele on this occasion deranged her understanding and she began a long search for Atys. In art her original statue was nothing but a dark quadrangular stone. Afterward she was represented as a matron, with a mural crown on her head, in reference to the improved condition of men arising from agriculture and their union into cities. A common attribute of the goddess is the veil about her head, which refers to the mysterious and incomprehensible in nature. In her right hand she often holds a staff, as an emblem of her power, and in her left a Phrygian drum. Sometimes a few ears of corn stand near her. The sun also is sometimes represented in her right hand, and the crescent of the moon in her left. We sometimes see her in a chariot drawn by lions; or else she sits upon a lion, and, as omnipotent nature, she holds a thunderbolt; or a lion lies near her. These symbols are all representations of her dominion and of the introduction of civilization by her means in the period of barbarism.

Cycads (from *Cycas* = Neo-Lat. nom. pl. of Gr. *κύκας,* the original name of the African cocoa-palm), a group of naked-seeded or gymnospermous plants, the cycadales. The existing cycads are an ornate remnant of an ancient and once widely extended series of forms, their nearest living relative being the gingko or maidenhair-tree. The large pith of the thick palm-like trunk of certain species is the source of the sago starch of commerce, whence the common name, sago-palm.

The cycads are a primitive and composite type with the wood structure of pines (and *Cordaites*), certain frond and other characters of ferns, and the outward habit of palms. As in the latter, the stem elongates by the slow growth of a terminal bud, with the unfolding of successive crowns of leaves or fronds spirally arranged in close order. As the leaves wilt down, there is formed from their bases an outer more or less persistent armor, which gives the stem its very characteristic appearance. For trunk-forming plants the cycads are mostly small or even pygmean. They include tuberous to columnar forms, and vary in size from underground trunks a few centimetres in diameter with fronds no more than a decimetre long to the tallest species of *Cycas* (Fig. 2, plate), which may reach a height of 20 metres. The most robust trunks reach rarely a metre in

diameter and the longest fronds a length of four metres. Several Central American and Peruvian species are epiphytic. Most of the cycads branch one or more times after reaching a certain age, and all are handsome and easily grown greenhouse plants. The Japanese gardeners produce examples of their native species, *Cycas revoluta,* with from 15 to 20 branches, and some of these plants are known to be upward of 300 years old.

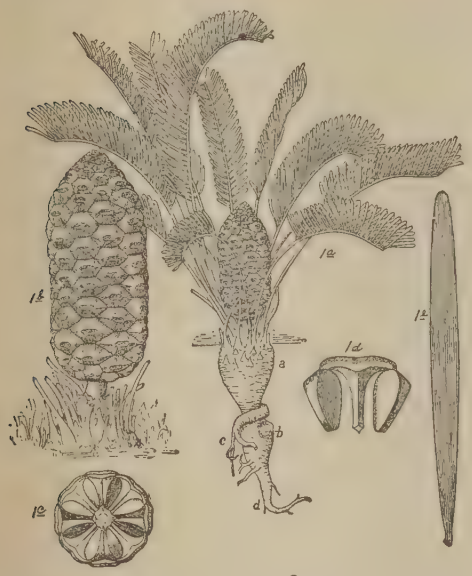

FIG. 1.— *Zamia floridana* DC. ♀ (From Wieland.) Miami, Florida, 15 November, fully six months previous to fecundation.
1*a*.— Entire plant. × 1-12.
a. main trunk (underground).
b. position of an old branch.
c. secondary tap root running out from the main foliage-bearing trunk, which is itself secondary.
d. primary or original tap root.
1*b*.— Cone (ten-ranked) seen in 1*a*. × ⅙.
1*c*.— Transverse section of a different cone. × ⅙. Eight sporophyllar ranks are seen. These cones vary much in size as well as in number of sporophyllar ranks, which may be odd or even. The number of sporophylls in each rank also varies.
1*d*.— Single sporophyll with ovules attached. × ½.
1*e*.— Pinnule showing dichotomous venation. × ½.

The cycads are widely dispersed in tropical and subtropical regions, but not usually abundant. *Zamia floridana* (Fig. 1), locally known as the coontie, occurs in thickly set clumps as underbrush in the more open pine woods of Florida, while *Z. pumila* is found more sparsely among the denser forest growths of the hammocks. The low-growing *Stangeria paradoxa* is abundant on the Natal border, and dense thickets of *Macrozamia spirali* cover wide stretches, to the exclusion of other growths, in southeastern Australia. But as a rule the cycads now play a rather inconspicuous role in forest facies, as compared with that of Mesozoic times as indicated by the fossil record. The more general type of occurrence in small open dells, as fern-like forest growths, is illustrated in the accompanying plate.

The stem consists finally in a thin zone of wood, cambium, and bast, enclosing a large medulla, and enveloped by a thick cortex, this being in the main the arrangement in all the gymnosperms and the dicotyls. But there is this difference: the cortex supports primarily the primitive outer investiture or armor of old foliar bases, which is quite persistent in some

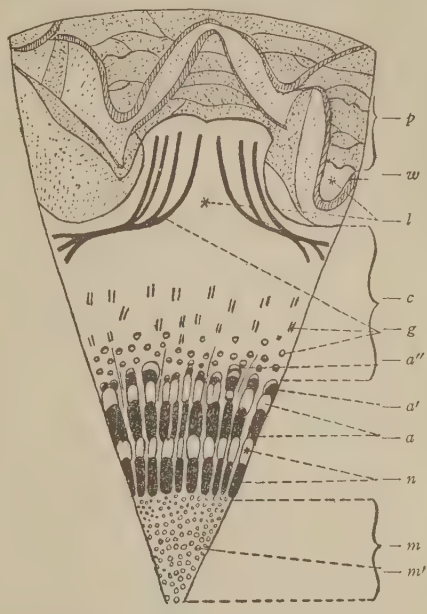

FIG. 3.— *Macrozamia Fraseri.* Transverse section of trunk × ½. (From Worsdell.) *p*, periderm in successively formed layers; *w*, wall of one of the leaf bases; *l*, leaf base; *c*, cortex; *g*, girdle leaf traces; *a''*, isolated bundle of a 3d anomalous wood zone; *a'*, 2d anomalous wood zone; *a*, 1st anomalous wood zone; *n*, normal wood (xylern dark, phloem light); *m*, medulla; *m'*, medullary bundle.

forms, but in others is more or less rapidly excised by the formation of successive layers of periderm, at first arising within the leaf-bases, and then in the cortex itself, with the casting off of thin bark. Moreover, in *Cycas, Macrozamia, Encephalartos,* and *Bowenia,* the woody cylinder does not as in the other genera remain single. After a time the primary cambium becomes inactive, and there successively arise in the cortex secondary cambiums of diminishing power and regularity. From these are produced the so-called "anomalous wood zones," which may rarely increase to a dozen.

The principal features of this second or polyxylic trunk type are shown in Fig. 3, together with the addition of a medullar system of anastamosing cauline bundles. These also occur in the pith of *Encephalartos.* The cortical bundle system is a complex one, varying greatly in the several genera, and including in part bundles or "girdle leaf traces" of a primitive concentric structure.

The cycads, unlike all vascular cryptogams, send down a primary root which continues as a tap-root. In the case of such subterranean trunks as those of certain species of *Zamia* (Fig. 1), the tap-root remains prominent, and its lateral branches are relatively small, the trunk assuming a carrot-like form. But in most genera the root system comes to be quite fila-

mentous, being largely made up of freely branching adventitious roots.

The leaves or fronds are usually of two kinds, scale and foliage. There are also the fertile or carpellary leaves of *Cycas*. All appear in terminal rosettes in the order named, scale, foliage, and when present, carpellary leaves. The scale leaves are dry and aborted foliage leaves, and are present in all but certain species of *Macrozamia*. The elliptical to acuminate foliage leaves are bipinnate in *Bowenia*, and pinnate in all the other genera. Prefoliation is direct in *Dion* and *Macrozamia*. In *Cycas* the rachis is straight, but the pinnules are circinnately rolled like those of ferns. Conversely in several other genera the pinnules lie straight along the once deflexed rachis. The pinnules, various types of which are shown (Fig. 4, plate), are of hard to leathery texture, much varying size and form, and dichotomous venation, except in *Cycas*, which has a single midvein. Those of *Stangeria* are very fern-like. The anatomical structure is much as in certain conifers and the extinct *Cordaites*.

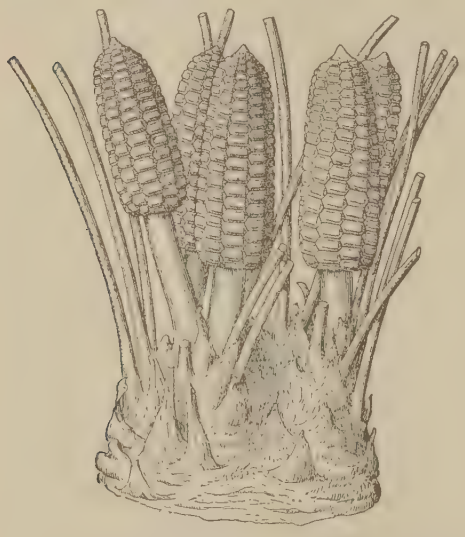

Fig. 5.— *Zamia floridana* DC. ♂ ×⅛. November stage of growth. Slightly bifurcate trunk bearing three staminate cones on the right and two on the left. Trunk shown with leaves removed and as if cut away on the ground level. (From Wieland.)

Fructification.— The living cycads are all dicœcious. The microsporophylls are always organized into cones which may vary from a few centimetres long to enormous forms 80 centimetres long by 15 or more centimetres in diameter, bearing as many as 600 microsporophylls, these being the most massive to be seen in seed plants. Several forms of microsporophylls are shown isolated (Fig. 6, plate), and staminate cones (Fig. 5) as borne on the parent plant. The sporangia are borne on the under side of the sporophyll and are structurally much like those of *Angiopteris* among the *Marattiaceæ*. In certain genera there is an obscure grouping into sori (Fig. 6, plate, A, B, and C).

The ovules, which are the largest known in the vegetable kingdom, are in the genus *Cycas*, doubtless the most primitive type among recent phanerogams, borne on the margins of modified leaves, emergent in regular series like the ordinary foliage leaves. In the other genera the megasporophylls each bear but a single pair of ovules, and are organized into a large terminal cone, or several such cones. See illustration of principal types of megasporophylls (Fig. 7, plate). The ovulate and staminate strobili agree in general form, and in the terminal or nearly terminal position in which they are borne in all the genera. After the production of cones in plants of either sex the stem continues its growth as a sympode.

Fecundation.— Among the various primitive characters of the cycads going to prove their descent from homosporous tree-ferns, easily the most recondite is the occurrence of motile multiciliate male cells of the coiled type characteristic of all the Pteridophytes except the club mosses. Spermatozoids are doubtless common to all the cycadales and are present in gingko, but are not known in any other phanerogams. The pollen grains are drawn through the micropylar tube into the pollen chamber (by suction), after which the pollen tube ruptures the exine and enters the nuccellar tissue, where it may branch. Meanwhile spermatozoids form from the generative cells and, after the rupture of the pollen tube, swim actively to the archegonium through a liquid medium afforded in part by the tube, and probably also by extrusion from the egg-cell. The mature spermatozoids are the largest known in any plant (or animal), at least in *Zamia floridana*. In this species they are visible to the naked eye, and have been studied alive in sugar solutions. They are of nearly spherical top-shape, with a ciliferous spiral running from the apex to the middle region, and motion is mainly by means of their cilia, but there is also amœboid motion of the spiral end (see Figs. 8 and 9).

Fig. 8.— *Zamia floridana* DC. End of mature pollen tube after formation of the cilia of the two spermatozoids and just before these pull apart to swim free to the archegonia. × 50. (From Webber.)

Fig. 9.— *Zamia floridana* DC. Mature spermatozoid while swimming free. × 100. (From Webber.)

From this most primitive form of fecundation known in flowering plants, it seems evident that not until the later stages of plant evolution did the pollen tube begin to serve as a direct means of transfer of the male cells as in other phanerogams.

The seed-coats instead of being entirely woody, as in the conifers, develop a lignified inner and a pulpy outer layer. In the cone-bearing forms appression faces form, but in *Cycas* the free seeds look much like plums, those of *C. circinalis* reaching the size of goose-

eggs. The embryo is one to three cotyledonous. Structurally cycad seeds are closely analogous to those of *Gingko* and the *Cordaitales*.

Classification and Geographic Distribution.— The living cycads include 107 species divided into two families, the *Cycadaceæ*, with the single genus *Cycas* and the *Zamiaceæ*, including the other genera. The species are nearly equally divided between the New and Old World tropical and sub-tropical regions. There are four indigenous Occidental genera as follows: *Zamia*, with 37 species, ranges over the mainland from Florida, where two species occur, to Brazil, and also over the West Indies; *Ceratozamia*, with six species, and *Dion* with two, are mainly Mexican and Central American; while the monotypic *Microcycas* is Cuban. In the Orient five genera occur: *Cycas*, with 23 species, is the most notable, and ranges over Australia, the East Indies, and Japan; *Macrozamia*, with 12 species, and the monotypic *Bowenia* are both strictly Australasian; while *Encephalartos* with 20 species, and the ditypic *Stangeria* are African.

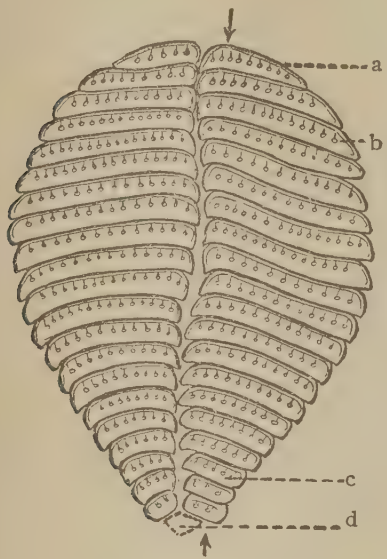

FIG. 11.—*Cycadeoidea ingens*—type specimen. Transverse section through upper portion of a single one of the yet folded crown of young fronds as fossilized when just about to emerge from the ramentum. The top side is next the centre of the trunk.

a, a pinnule cut near its summit; *b*, one of the transversely cut vascular bundles; *c*, a pinnule cut near its base; *d*, position of rachis. × 4. (From Wieland.)

Fossil Cycads.—As in the case of various unique types in the existing flora, the present isolation of the cycads is connected with a history of great extent in space and time. The living forms are only two side branches of a varied cycadalean group, of which the *Cycadaceæ* are the more ancient, characteristic leaves of the *Cycas* type having already been present in the Carboniferous limestone.

The *Zamiaceæ* were already present in the Jurassic, during which period cycadaceous types apparently culminated in both variety and extent.—Noteworthy is the occurrence of an associated leaf and fruit justly referred to the living genus *Cycas* in the upper Cretaceous (Atane Beds) of Greenland. Since Cretaceous time the northern limit of the cycads has slowly retreated from the Arctic area to its present position. A species referable to the African *Encephalartos* was yet left behind in the lower Miocene of southern Europe.

FIG. 12.—*Cycadeoidea Wielandi*. Longitudinal section through an ovulate strobilus borne on trunk 393 of the Yale collection. Exteriorly are the old leaf bases shown partly cut away. The fruit arises from the axil of that to the right. The bundle supply of the leaf bases and thick peduncle is shown, also the exterior hairy bracts. × ⅔. (From Wieland.)

Bennettiteæ.—In addition many cycad-like plants are known, from the Cretaceous on, which are but distantly related to the living forms. Among these the *Bennettiteæ* are of deep interest from an evolutionary point of view, and may represent a fifth great group of the gymnosperms, the Bennettitales. Interesting imprints of leaves, fruits, and stems belonging to this group are known with certainty from the Trias of southern Sweden, and the general type seems to have extended quite over the globe in Jurassic time. Beautifully silicified trunks with microscopic structure preserved have been found in considerable number in the European Jurassic and Cretaceous, also in Maryland, and more recently in the Black Hills region in uppermost Jurassic or else lowermost Cretaceous strata. The American specimens include both low-branching trunks (Fig. 10, plate) and columnar forms, and are now among the best-known of ancient plants. These trunks are usu-

ally referred to the genera *Cycadeoidea* and *Cycadella*. They possess abundant ramentum and are more fern-like than are those of the living cycads, with which there is, however, in most essentials of trunk, and especially in leaf-structure, as determined from the silicified crowns of young leaves discovered by Wieland (Fig. 11), a close agreement. But in fructification they are entirely different.

The ovulate cone is a bract-enveloped spherical to pear-shaped and small to full pear-sized body, terminating a short axillary shoot emerging laterally on the trunk from among the old leaf-bases and ramentum, as here illustrated (Fig. 12). In structure this fruit is wholly unique. The end of the peduncle expands into a fleshy convex or conical receptacle, on which is inserted, as if fused into a single body, a series of sterile scales, and fertile sporophylls. Each of the latter bears at its end a single seed with the elongate micropylar tube directed outward from between the expanded tips of the non-fertile interstitial scales, which are of such

FIG. 13.— *Cycadeoidea*. Longitudinal section through bisporangiate strobilus. Diagrammatic. At the centre is the apical ovulate cone closely invested by a zone of short-stalked ovules and interseminal scales. On the left is a single once pinnate and yet folded fertile frond of the staminate disk. On the right a similar synangia-bearing frond is arbitrarily shown in an expanded position. Exteriorly are the imbricating hairy bracts. About ¾ natural size. (From Wieland.)

evenly decreasing length from the centre of the receptacle to its periphery, as to thus form a continuous outer covering of the fruit. Basally there are sterile organs only. The ellipsoidal seeds are about three millimetres long, orthotropous, exalbuminous or nearly so, and dicotyledonous. Perhaps the nearest approach in general form among plants now living to the present type of fructification is to be seen in the peculiar ovulate strobilus of certain species of the monocotyl *Pandanus*, rather than in any known cycads whatsoever. The staminate fructification is even more noteworthy (Fig. 13). It is bisporangiate, and also a lateral bract-enveloped shoot. At the centre is an ovulate cone of the structure just described *which may in some species be functional*. In any case an earlier bisexual condition is indicated, from which both monœcious and dicœcious forms were derived. Surrounding the ovulate centre is an hypogynous staminate disk, made up in different

FIG. 14.— *Cycadeoidea dacotensis* Macbride. Portion of a transverse section through one of the bisporangiate strobili, cutting adjacent synangia. In the central synangium the outer covering of heavy walled prismatic cells is seen to be followed by a thin-walled layer. Adhering to this are the sporangial loculi closely ranged on each side of the synangium in two rows. Each loculus is delimited by bands of collapsed cells with adhering pollen grains, and each row of loculi is bounded on the inner side by well defined tissue a single cell in thickness, except between the angles of adjacent loculi, where there is a thickness of several cells. This layer thus bounds the two opposed inner faces of the synangium. It is usually split on the median line of the sporangia, and the striate appearance of its elongate cells when cut obliquely is indicated in several instances.

The tips of the three synangia on the left side of the figure are seen to be oriented nearly at right angles to the others, being cut very obliquely. At the lower left-hand corner portions of two transversely cut sporophylls are seen. × about 25. (From Wieland.)

species of from 12 to 20 once pinnate fertile fronds with basally adnate petioles, each frond having been once deflexed in prefloration. When fully expanded, these flowers were quite 30 centimetres in diameter, and must have been objects of great beauty. The pollen-bearing or staminate fronds are of essentially filicinian form. The pollen is borne, as explained in fuller detail (Figs. 14 and 15), in synangia nearly identical structurally with the asexual spore-bearing synangia of the living tree fern

Marattia. Thus these fossil fruits exhibit a striking intermediate condition indicative of the evolution of heterospory in these gymnosperms from some ancient homosporous marattiacean stock. Moreover, while the staminate disk surrounding the ovulate axis here indicates primarily an evolution terminating in the gymnosperms, the juxtaposition of parts is exceedingly suggestive of the possibility, if not the manner as well, of angiosperm development directly from filicinian forms.

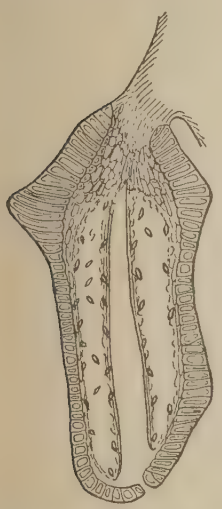

FIG. 15. — *Cycadeoidea dacotensis*. Macbride. Longitudinal section (in the narrow direction) through a synangium, showing attachment to the sporophyll, the several layers of the synangial wall, its dehiscence, the attachment of the sporangia, and the median sulcus between them. The basal buttressing of the outer wall is characteristic. Pollen grains shown enlarged. × 37. (From Wieland.)

Peabody Museum, Yale University.

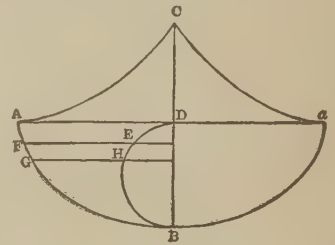
Cyclades, sĭk'lā-dēz, or **Kyklades,** the ancient and likewise the modern name given to the principal group of islands in the Grecian Archipelago, now belonging to the kingdom of Greece, and formed into a separate province. The largest islands of the group are Andros, Paros, Myconos, Tenos, Naxos, Melos, and Thera or Santorin. They are situated between lat. 36° and 38° N., and lon. 24° and 26° 30′ E. They are generally mountainous, and evidently of volcanic formation. Hermopolis is the principal trade centre. Pop. about 143,828.

Cyclamen, sĭk'la-mĕn, a genus of perennial herbs of the natural order *Primulaceæ*. There are about a dozen species, mostly natives of the Caucasus and the Mediterranean region, and characterized by flattish turnip-like tubers or corms, long-stemmed, more or less rounded or heart-shaped leaves, and solitary, single flowers with reflexed petals of great range of color. The best known species grown in America is *C. latifolium*, popularly known as *C. persicum*. It has produced a very large number of horticultural varieties, including some double forms, and is probably the most satisfactory window gardening plant, because of the profusion of its blossoms during many months, and also because of the simplicity of its culture. The seeds are

sown in early winter and kept steadily growing until the following winter, when they should commence to blossom; that is, in from 12 to 15 months. The roots must not be allowed to dry up like other bulb roots. The plants do not stand the heat of American summers and are therefore less popular as garden flowers than in Europe. The name sow-bread is sometimes given to the species chiefly cultivated in the United States, because swine are fond of the acrid tubers.

Cycle (Greek, *cyclos* or *kuklos,* a circle) is used for every uniformly returning succession of the same events. On such successions or cycles of years rests all chronology, particularly the calendar. Our common solar year, determined by the periodical return of the sun to the same point in the ecliptic, contains 52 weeks and one day, and one day more each leap-year. Consequently in different years the same day of the year cannot fall upon the same day of the week; for example, the year 1894 began with a Monday, 1895 with a Tuesday, 1896 with a Wednesday; but 1897, being preceded by a leap-year, began, not with a Thursday, but with a Friday. If we count only common years, it is manifest that from seven years to seven years every year would begin again with the same day of the week as the seventh year before; or, to express the same in other words, after seven years the dominical letter would return in the same order. But as every fourth year, instead of a common year, is a leap-year, this can only take place after 4×7, or 28 years. Such a period of 28 years is called (1) a solar cycle, and serves to show the day of the week falling on the first day of January in every year. For this purpose it is only requisite to know with what day of the week a particular year began, and then to prepare a table for the first days of the 27 following years. It is the custom now to fix the beginning of the solar cycle at the ninth year B.C., which was a leap-year, and began with Monday. If you wish to know what day of the week the new-year's day of any year of our reckoning is, you have only to add nine to the number of the year, and then, after dividing this sum by 28, the quotient gives the number of complete cycles, and the remainder shows what year of the solar period the given year is, of which the table above mentioned gives the day of the week with which it begins. But this reckoning is only adapted to the Julian calendar. In the Gregorian it is interrupted by the circumstance that in 400 years the last year of the century is three times a common year. Hence this reckoning will not give the day of the week for the first day of the year; but from 1582 (the commencement of the Gregorian calendar) to 1700 for the 11th, from 1700 to 1800 for the 12th, in the 19th century for the 13th day of the year, and so on, from which we must then reckon back to the new-year's day. Hence it is far more convenient to prepare a table for the beginning of a century (for example, for 1801, which began with Thursday), and divide by 28 the number of years from that to the given year, and with the remainder seek in the table the day of the week for the first day of the year. Besides this another cycle is necessary for the determination of festival days, by the aid of which the feast of Easter, by which all the movable feasts are regulated, is to be reckoned. Easter depends on the first full moon after the vernal equinox. (2) The lunar cycle is a period of 19 years, after which the new moon falls again on the same day of the month. On 2 Jan. 1813 there was a new moon; 2 Jan. 1832 there was a new moon again. As the time from one new moon to another, as astronomy teaches, is about 29½ days, a table of the new moons for 19 years may be very easily prepared. It is only necessary to observe that this lunar cycle always begins with a year of which the first new moon falls on the 1st of January, and that this was the case the first year B.C. Divide by 19 the number of the year plus 1, and the remainder will show what year in the lunar period the given year is. The number of the year is called the golden number. Besides these two cycles, which are indispensable for the calculations of the calendar, there are some others, several of them known by the names of periods. In China a cycle covers a period of 60 years; hence the poet, Moore, may have had in mind a definite length of time when he used the expression, "A cycle of Cathay."

Cycloid, the curve generated by a point in the plane of a circle when the circle is rolled along a straight line and always in the same plane. Imagine a circle, D E H B, which is



rolled along a straight line A D *a* in the plane of the circle itself till the point first at rest is brought to rest again, after an entire revolution. The curve A F G B *a* thus described by this point is called a *cycloid.* The circle DEB is called the generating circle; the line A D *a* on which it is described, the base of the cycloid. The length of the cycloid is four times the diameter of the generating circle, and its area three times the area of this circle. This line is very important in the higher branches of mechanics. Imagine a pendulum C B suspended by a thread in such a way that in the swinging of the pendulum between two cheeks C A, C *a,* each of which is bent in the form of a semicycloid equal to the semicycloid A F G B, the thread rolls and unrolls itself. Then the bob of the pendulum will describe the curve A F G B *a,* and the longest vibrations will be performed in the same time as the shortest, producing isochronism. The cycloid is hence called an isochrone. It is also called brachistochrone or line of swiftest descent; because it is the line in which a heavy body, falling in a direction oblique to the horizon, would pass in the shortest time between two points.

Cycloid Fishes, an order of fishes, according to the arrangement of Agassiz, having smooth, round, or oval scales, as the salmon and herring. The scales are formed of concentric layers, not covered with enamel and not spinous on the margins; they are generally imbricated, but are sometimes placed side by side without overlapping.

Cyclom'eter, an invention for measuring and recording the distance traveled by wheeled vehicles, extensively used in cycling. Its most important application is in railroading. The apparatus is connected with the wheels of a car, and by recording the number of revolutions tells on a sheet of paper inside the car the number of miles traveled. It is purely automatic, and in addition, by an attachment of extreme beauty and ingenuity, every inequality in the road-bed of a railroad is detected and located.

Cyclone (Gr. «whirling,» «revolving»), a term originally applied to the violent rotatory tempests of the tropical and sub-tropical regions, called in the West Indies hurricanes; in Senegal, tornadoes; at the Cape of Good Hope, trovados; in the Chinese Sea, typhoons; and on the west coast of Central America, papagallos. The diameter of rotation of such storms is from 200 to 300 miles and sometimes exceeds 500, and the velocity of the wind, according to Humboldt, is sometimes as much as from 200 to 300 miles an hour. The centre of the storm often advances 30 miles an hour. Since the discovery of the rotatory course of winds even at a distance from the tropics the term cyclone has, however, been applied to any system of winds blowing round a centre of low pressure, and a cyclone is distinguished from an anti-cyclone, which is a system of winds with a centre of high pressure. These two system are always in proximity to one another, though their centres may be, and usually are, very wide apart. In the cyclone there is a gradual rise of barometric pressure from the centre to the circumference, in the anti-cyclone a gradual fall; in consequence of this the tendency of the winds in a cyclone is toward the centre, in an anti-cyclone it is from the centre; a cyclonic system travels in a certain direction from the region where it originates till it is dissipated or destroyed; an anti-cyclonic system generally remains in the region where it is formed, its centre only shifting about within comparatively narrow limits; the isobaric lines of a cyclone, especially near the centre, are almost circular, those of the anti-cyclone extremely irregular, and the atmospheric gradient (that is, the rate of increase or decrease of pressure) is usually greater in the former than in the latter. While the general tendency of cyclonic winds is toward the centre of the cyclone, their actual course is not directly toward that space, but spirally round it, the lines of rotation being nearly the same as those of the isobaric curves. The direction of rotation is stated in 'Buys-Ballot's Law of the Winds,' which in one of its forms is: «Stand with your back to the wind, and the barometer is lower, in the northern hemisphere, on your left hand than on your right; in the southern hemisphere, on your right hand than on your left.» There are important differences in the weather accompanying cyclones and anti-cyclones, but these are so much modified by local circumstances that it is impossible to enter upon them here. Almost the only general observation that can be made on this head is that the air in a region over which an anti-cyclone hovers, especially near the centre, is very dry, and either clear or almost free from clouds. The great cyclonic area of the United States is the central Mississippi valley, notably Kansas. They are less common apparently on the east side of the river and less violent, but occur with some frequency as far east as the Alleghanies.

Cyclopædia. See ENCYCLOPÆDIA.

Cyclopean (sī-klō-pē'ạn) **Works,** in ancient architecture, masonry constructed with large blocks of stone unhewn and uncemented, said to be the works of a fabulous race of giants, the Cyclopes (q.v.) Some of these works were the walls of Argos, Tiryns, and Mycenæ. Similar walls are to be found in various parts of Greece, Italy, and Sicily, at Persepolis and elsewhere in Asia, and at Cuzco, Peru.

Cyclópes, sī'klō-pēz, a race of giants in the mythology of Greece. The earlier mythology makes them the sons of Uranus and Ge (Heaven and Earth). They belonged to the Titans, were three in number — Arges, Steropes, and Brontes — and had only one eye, situated in the middle of their forehead. They were cast into Tartarus by their father, and again by Cronus, but being released by Zeus provided him with thunderbolts, and became his ministers. They were slain by Apollo for having furnished Zeus with thunderbolts to kill Asclepius. Wholly different from these are the sons of Neptune, of whom Polyphemus was the chief. They are described in the Odyssey (ix. 106, et seq.) as uncouth giants, supporting themselves by the breeding of cattle. According to Homer they resided on the west side of Sicily. A later tradition describes the Cyclopes as the servants and assistants of Hephaistus (Vulcan), engaged in making the armor and metal ornaments for gods and heroes. The name Cyclopes is also given to a Thracian tribe of giants, who according to tradition built the stone works known as cyclopean (q.v.) They were named from their king Cyclops.

Cyclops, sī'klŏps, a genus of small fresh-water crustaceans, type of a family (*Cyclopidæ*) in the order *Copepoda* (q.v.). They are popularly included under the wide title of «water-fleas.» Various species are common as active swimmers in fresh-water pools or slow-flowing brooks, and a few forms have been recorded from the sea. The head-region is not distinct from the first ring of the thorax; there is a pear-shaped segmented body and a long abdomen; both pairs of antennæ are long, and in the male the anterior pair form claspers. The average length of the commonest species is from two to three millimetres; the males are generally smaller than the females. A very marked feature, to which the name refers, is the single medium eye, usually bright crimson and sparkling like a gem; and not less noticeable are the two large egg-bags carried by the females. They eat both animal and vegetable matter, and are very prolific.

Cyclora'ma, a painted conspectus of a scene arranged in a circular room, so as to afford the eye a single comprehensive view. Battles have been thus presented in the United States in the form of circular panoramas, as that of Gettysburg. See PANORAMA.

Cyclostomi, sī-klŏs'to-mī (Gr. «round-mouthed»), one of the five primary divisions or classes of the craniate *Vertebrata,* also called *Agnatha, Marsipobranchii,* etc. Excluding the doubtful extinct ostracoderms, the cyclostomes have an imperfect, embryonic brain case, no lower jaw, no paired limbs or their supporting girdles, no ribs and no scales. The skeleton

is purely cartilaginous and the notochord persists in living forms. There are many remarkable structural specializations in the representatives of the three or four subdivisions, and the peculiarities of the living forms are such as to indicate that they are survivals of a once extensive group of fish-like animals; but only a single species of fossil can be referred to here with certainty. The following may be indicated as orders: *Cycliæ,* with the vertebral column well developed and, like other parts of the internal skeleton, ossified; no external skeleton and no paired limbs; the tail provided with a large diphycercal fin supported by rays; the skull a cartilaginous capsule, with prominent ear sacs, and a large median nasal sac with a circle of cirri about its orifice; this group is represented by a single species (*Palæospondylus gunni*), from the Devonian rocks of Scotland; *Hyperoartia,* having the internal skeleton entirely unossified, with a persistent notochord and no vertebræ; body eel-like with a caudal fin; the mouth a suctorial disk, with the rasping end of a piston-like tongue appearing at its centre; the nasal sac median and its diverticulum not penetrating the palate; and seven pairs of pouch-like gill slits, which communicate with a common respiratory tube distinct from the esophagus; represented by the single family, *Petromyzontidæ,* with the principal genera *Petromyzon* (lamprey, q.v.), *Lampetra, Mordacia* and *Geotria;* and *Hyperotretia,* like the last in the characters enumerated except that the nasal diverticulum (*hypophysis*) perforates the palate and opens into the mouth and there is no separate internal respiratory tube. There are two families of this group, the *Bdellostomidæ,* with 6 to 14 gill pouches on each side opening separately at the surface; and the *Myxinidæ,* with the single genus *Myxine* (hag fishes, q.v.), in which the six pairs of gill pouches have a single common external opening on each side. To these Prof. Cope has added the great extinct group *Ostracophori* (q.v.).

Cydias, sĭd'ĭ-ăs, Greek painter: b. the island of Cythnus, one of the Cyclades. Hortensius, the orator, purchased his painting of the Argonauts for 144,000 sesterces (nearly $7,200). This same piece was afterward transferred by Agrippa to the portico of Neptune.

Cyd'nus, a river of Cilicia, rising in the Taurus, and flowing through Tarsus into the Mediterranean Sea. The mouth of the Cydnus is often choked with sand and other alluvial deposits.

Cydonia (named, it is believed, from a place called Kydon, in the island of Crete, of which this fruit is a native); a genus of fruit trees, order *Pomaceæ.* It has leafy calyx lobes, and many-seeded cells in its fruit. *C. vulgaris* is the quince; *C. japonica* is an ornamental shrub. See QUINCE.

Cygnus, sĭg'nŭs («the Swan»), one of Ptolemy's northern constellations. It includes the double star Albiero, the components of which are differently colored, one of them being orange and the other blue. The motions of the double star, 61 Cygni, have been carefully observed, and it has been estimated that the pair together weigh about one third as much as our sun.

Cylinder, the name of a geometrical solid formed by two parallel circular surfaces, called the superior base and the inferior base, and a convex surface terminated by them. There is a distinction between rectangular cylinders and oblique cylinders. In the first case, the axis, that is, the straight line joining the centres of the two opposite bases, must be perpendicular to them in the second, the axis must form an oblique angle with each base. The cubic contents of a cylinder are equal to the product of the base by the altitude. Archimedes found that the solidity of a sphere inscribed in an equilateral cylinder, that is, of a sphere whose diameter is equal to the height and also to the diameter of the base of the cylinder, is equal to two thirds of the cubic contents of the cylinder. A right circular cylinder may be defined as the solid generated by the revolution of a rectangle about one of its sides.

Cylindrical Lens, a lens whose surfaces are cylindrical instead of spherical, which is usually the case. A convex cylindrical lens brings the image of a source of light to a focus in a line instead of in a point. These lenses are employed in spectroscopes for examining star-spectra. They are usually planocylindrical; that is, cylindrical on one side and flat on the other.

Cylindroma. See TUMOR.

Cylon, an Athenian leader who, with the intent to make himself tyrant of Athens, occupied the Acropolis, and being reduced by a blockade, was put to death by Megacles, in violation of his oath to spare him.

Cyma, sī'mą, in architecture, a wavy molding the profile of which is made up of a curve of contrary flexure, either concave at top and convex at bottom or the reverse. In the first case it is called a cyma recta; in the second a cyma reversa. It is a member of the cornice, standing below the abacus or corona.

Cymbals, among the ancients, musical instruments, consisting of two hollow basins of brass, which emitted a ringing sound when struck together. The instruments which are now used in military music, and have been borrowed from the East, seem to have taken their rise from these. They were used in the worship of Cybele, Bacchus, Juno and other deities.

Cymbeline, sĭm'bĕ-lĭn or sĭm'bĕ-līn, British king of the 1st century. Not much is known of his career. Shakespeare's play of 'Cymbeline' was written about 1609. A few statements about Cymbeline and his sons the dramatist took from Holinshed's 'Chronicle,' but the story of Imogen forms the ninth novel of the second day of Boccaccio's 'Decameron.' These two stories Shakespeare has interwoven; and the atmosphere of the two is not dissimilar: there is a tonic moral quality in Imogen's unassailable virtue like the bracing mountain air in which the royal youths have been brought up.

Cyme, an ancient city of Æolia, which, although styled by Strabo the largest and noblest of Æolian cities, is of little historical importance. The father of Hesiod lived here before he migrated to Ascra in Bœotia.

Cyme, in botany, a mode of definite inflorescence in which the principal axis terminates in a flower, and a number of secondary

axes rise from the primary, each of these terminating in a flower, while from these secondary axes others may rise terminating in the same way, and so on. All the flower-stalks rise to nearly the same height, so that they resemble a compressed panicle.

Cymri, kĭm'rĭ, or **Kymry,** a branch of the Celtic family of nations which appears to have succeeded the Gaels in the great migration of the Celts westward, and to have driven the Gaelic branch to the west (into Ireland and the Isle of Man) and to the north (into the Highlands of Scotland), while they themselves occupied the southern parts of Great Britain. At a later period (during the 5th and subsequent centuries) they were themselves driven out of the Lowlands of Great Britain by the invasions of German tribes, and compelled to take refuge in the mountainous regions of Wales, Cornwall, and the northwest of England. A part of them also crossed over into Gaul, and settled in Brittany. Wales may now be regarded as the chief seat of the Cymri (a name which the Welsh still give to themselves), as it is still the chief place where the Cymric dialect of the Celtic language is spoken. A variety of this dialect, called the Cornish, was at one time spoken also in Cornwall, and another variety, called the Armorican, is still spoken in some parts of Brittany. On account of the similarity of the name the Cymri have been identified both with the Cimbri and the Cimmerii, but the identification in both cases, especially the latter, is doubtful. The origin of the name is unknown.

Cynægirus, sĭn-ē-jī'rus, Athenian hero, brother of Æschylus. At the battle of Marathon he lost his hands in attempting to prevent a Persian ship from being pushed off, and then seized the gunwale with his teeth.

Cynanchum, sĭ-năn'kŭm, a genus of *Asclepiadaceæ,* of which some species have been used medicinally, as *C. monspeliacum,* a violent purgative, the so-called Montpellier scammony, and *C. vincetoricum,* formerly in repute as an antidote to other poisons. The Indian *C. extensum* yields fibre, and the *C. ovalifolium* of Penang, caoutchouc.

Cyn'ara, a small genus of compositæ, in many respects like the thistle. The two best-known species are the artichoke (*C. scolymus*) and the cardoon (*C. cardunculus*). Both are hardy perennials, found wild in southern Europe and northern Africa. The flowers are sometimes used to curdle milk. See Artichoke; Cardoon.

Cynewulf, kĭn'ĕ-woolf, Anglo-Saxon religious poet. His name is only known from its being given in runes in the poems attributed to him, namely: 'Elene' (Helena), the legend of the discovery of the true cross; 'Juliana,' the story of the martyr of that name; and 'Crist' (Christ), a long poem incomplete at the beginning. The name Cynewulf also occurs as the solution of one of the metrical riddles in the Anglo-Saxon collection. Other poems, the 'Andreas,' the 'Wanderer,' the 'Sea-farer,' etc., have been ascribed to him without sufficient grounds. Cynewulf probably lived in the first half of the 8th century. From his poems we may gather that he spent the earlier part of his life as a wandering minstrel, devoting the latter to the composition of the religious poems connected with his name.

Cynics, a school of philosophers founded by Antisthenes, a scholar of Socrates, at Athens, about 380 B.C. This philosophy was a one-sided development of the Socratic teaching by Antisthenes and his followers, who looked only to the severer aspect of their master's doctrines, and did not see or did not rightly appreciate the way in which the seeming severity of the teaching of Socrates was corrected by the genial character of the man himself. An equally one-sided attention to the other aspect of the practical philosophy of Socrates, as exhibited in his own life, gave rise to the opposite teaching of Aristippus and his followers. There were, nevertheless, some noble features in the doctrines of the Cynics. They made virtue to consist in self-denial and independence of external circumstances, by which, as they thought, man assimilates himself to God. This simplicity of life, however, was soon carried so far by the Cynics that it degenerated into carelessness, and even neglect of decency. In their attempts at living conformably to nature they brought themselves down to the level of savages, and even of brutes. No wonder, then, that the Cynics soon became objects of contempt. The most famous of their number were, besides their founder, Diogenes of Sinope (412 to 323 B.C.), Crates of Thebes (about 328 B.C.), with his wife Hipparchia, and Menippus (about 60 B.C.), who was the last of them. After him this philosophy merged in the Stoic, a more worthy and honorable sect. See Cyrenaics.

Cynips, the gall-fly; a genus of insects belonging to the order *Hymenoptera,* the suborder *Petiolata,* section *Parasitica,* and family *Cynipidæ.* They are a kind of small flies remarkable for their extremely minute head and large, elevated thorax. The females are provided with an ovipositor by which they make holes where they deposit their eggs in different parts of plants, thus producing those excrescences which are known as galls. In these excrescences the small larvæ are produced, which live there either singly or several of them together for five or six months, and consume the interior for their nourishment. Some of the species undergo their transformations before leaving the excrescences, others quit them and bury themselves in the earth, to undergo their transformations there. The *C. gallotinctoria* is of a pale fawn-color, and lives on a species of oak which grows in the Levant, where it produces the so-called gall-nuts, which yield a black coloring matter, and are used in the making of ink. The *C. rosæ,* or bedeguar gall-fly, produces the hairy excrescences which are seen on the rose-bush and the sweet-brier. It is black, with the exception of the feet and the abdomen, which are red. The *C. psenes* is used in the Levant for caprification, an operation intended to hasten the maturity of figs. (See Caprification.) Some species of gall-flies, such as the *C. fulviceps* and the *C. quercus-inferus,* have in some cases been produced from aphides instead of in the ordinary way from galls.

Cynocephalus, sī-nō-sef'a-lŭs (Gr. "dog-head"), a genus of monkeys including the various species of baboon (q.v.).

Cynodictis, sī-nō-dĭk'tĭs, a genus of primitive *Canidæ* (see Dogs, Fossil) of the Oligocene Epoch in Europe and America, a collateral ancestor of the modern dog family. It was of weasel-like proportions, with long tail, small brain, civet-like teeth and other primitive characters. Most of the species were small.

Cy'nodon Dac'tylon, Capriola Dactylon, Bermuda or **Bahama Grass,** a low, creeping, perennial grass found in most warm and tropical countries, where from its drought-resisting capacity it is used as a common pasture grass. It has delicate leaves and upright, leafy flowering branches which bear three to seven slender divergent spikes. Three of the four species are Australian. In the United States it is dispersed from Pennsylvania to Florida and westward to Texas and California, being hardy from Philadelphia southward. It grows freely on poor, sandy soils, but the leaves are short; on good soil it will grow one or two feet high. It will grow on almost any soil, if not too wet. Its root-stock runs readily, thus making it a valuable grass for binding drifting sands and for holding embankments liable to wash. Being insensible to heat and drought it soon makes a fine sod equally useful for grazing or for a lawn. It is also used for hay and is in bloom from April to October. It will not grow in the shade and it is easily injured by low temperatures, turning brown with the first frosts. It rarely bears seed, except in the extreme Southern States. The usual method of propagation is to chop up the roots, sow them broadcast and plow in, shallow. Once introduced it is hard to get rid of, but it has been eradicated by constantly plowing the land every week or so, or growing oats, followed by cowpeas in rows, which could be cultivated. Its rhizome is used in medicine, as a substitute for sarsaparilla. The plant is a favorite food of the wild goat, hence the name *Capriola.*

Cynoglossum, hound's-tongue, a genus of plants of the natural order *Boraginaceæ,* consisting of about 75 species of coarse herbs of wide distribution in temperate climates. The flowers form scorpioid racemes, as in the allied comfrey and forget-me-not, and are of a reddish color. Five species are found in America, the best known being hound's-tongue *C. officinale*). This genus is found in waste places from Quebec to Minnesota, and south to Kansas and North Carolina. It has a disagreeable smell like that of mice, and was at one time used as a remedy for scrofula. It is a troublesome weed, native in Europe and Asia. Another well-known species is *C. virginicum,* wild comfrey, which grows from New Brunswick south to Florida, and west to Louisiana and Kansas.

Cynomo'rium, a genus of parasitic plants, the best-known representative of which is *Cynomorium coccineum,* a fungus-like plant, found in the islands of Malta and Gozo. It was long known as *Fungus melitensis,* and enjoyed the highest reputation as a styptic, besides being used as an astringent in dysentery and other maladies. These uses, however, depended on the doctrine of signatures alone, its scarlet color and blood-like juice being interpreted as providential indications of its curative destination for all injuries or diseases accompanied by bleeding. It was jealously guarded by the Knights of Malta.

Cynosarges, sī-nō-săr'jēz, in ancient Athens, originally the name of a sanctuary of Hercules and a gymnasium in the east of the city, afterward extended to the suburb of Athens surrounding the gymnasium. It was in this gymnasium that Antisthenes, the founder of the Cynics, taught.

Cynoscephalæ, sĭn-ŏs-sĕf'ạ-lē (Gr. signifying dogs' heads), the name of a range of hills in Thessaly, memorable for two battles fought there in ancient times. The first was 364 B.C., between the Thebans and Alexander of Pheræ, in which Pelopidas was slain; and the second, 197 B.C., in which the last Philip of Macedon was defeated by the Roman consul Flaminius.

Cynosure, sĭn'ō- or sī'nō-shūr, or **Cynosura,** an old name for the constellation of the Little Bear or Ursa Minor, which contains the pole star in the tip of the tail. Cynosure, in a figurative sense, is hence used as equivalent to something which attracts general attention or draws all eyes toward it. The word literally means dog's tail.

Cynosu'rus, a genus of grasses. See Dog's-tail Grass.

Cynthia, the moon; a surname of Artemis or Diana, the moon goddess. In mythology Mount Cynthus, on the island of Delos, is said to have been the birthplace of Diana.

Cynthiana, sĭn-thĭ-ā'nạ, Ky., city, county-seat of Harrison County, on the south fork of the Licking River and on the Kentucky Central Railroad; 33 miles northeast of Lexington. It is a trade centre for farming and stock raising, and is the seat of Harrison Female College. It has carriage, plow, and cigar factories, distilleries (noted for their Bourbon whiskey), good schools, public library, two national banks, and several newspapers. Pop. (1900) 3,257.

Cynthius, surname of Apollo, the sun god, from Mount Cynthus, on the island of Delos, at the foot of which he had a temple, and on which he was born. Diana, his sister, is called Cynthia.

Cyperaceæ, sī-pē-rā'sē-ē, a natural order of monocotyledonous plants including 2,000 species. These herbaceous plants generally grow in moist places on the margins of lakes and streams, with a cylindrical or triangular culm with or without knots; the leaves are sheathing. The order comprises the genera *Carex, Scirpus, Cyperus, Schœnus, Mariscus, Papyrus,* and others.

Cyperus, sī-pē'rus, a genus of perennial herbs of the natural order *Cyperaceæ* (q.v.). The numerous species which are natives of tropical and temperate climates are characterized by having rootstocks or tubers, grass-like leaves, simple stems sparsely leafy below, perfect flowers in small compressed spikes which are arranged in compound umbels with numerous more or less attenuated bracts which have suggested the popular names umbrella plant and umbrella palm, which are perhaps most frequently given to *C. alternifolius.* This species is a very popular window garden and greenhouse plant, native of Madagascar. It is readily propagated by means of seed or by division of the larger plants and is easily cultivated in any good potting soil kept moist. It does best in a moist atmosphere. Many of the species are troublesome weeds in cultivated fields; some

are useful for food, their underground parts being starchy and mucilaginous; the tubers of others are used in perfumery. The chufa (*C. esculentus*) is valued in the Southern States for its tubers, upon which swine thrive well. Papyrus (q.v.) is the product of *C. papyrus*. Some species have been used in medicine but are now rarely employed.

Cy-près, sē prā (Fr. «as near,» namely, as possible), the principle in the American and English law whereby a gift legal in form, which cannot be administered exactly as the testator specified, or which is not definitely specified, may be applied as nearly as possible like what was intended by the donor. In the United States the majority of cases wherein the cy-près doctrine is applied comes under charitable bequests on gifts for the advancement of education. In the United States it is held that the equity courts cannot make valid charities which are uncertain, but where charitable trusts have once been in part administered as directed by the testator, such action will prevent the trust from being defeated by change of circumstances. Where only a general charitable intention is expressed, as, relief of the poor, aid for the injured, under the cy-près doctrine the court of chancery may direct the disposal of the gift to some form of charity «as nearly as possible» like that mentioned or indicated by the testamentary gift of the testator. The laws based on the cy-près doctrine vary in different States. For further ways in which the cy-près doctrine is applied see ESTATE; FEE TAIL.

Cypress, the popular name for members of the genus *Cupressus* and for certain species of the related genera, *Taxodium* and *Chamæcyparis,* all of which belong to the natural order *Coniferæ*. There are about a dozen species of *Cupressus,* which are trees or sometimes shrubs with small aromatic, evergreen opposite leaves and tiny monœcious solitary flowers, the pistillate developing into almost globular cones containing numerous seeds which mature the second season. The best-known species is probably the common European cypress (*C. sempervirens*) which has been introduced into the United States. It is a stately tree of about 80 feet, of remarkable longevity, and of wide utility principally on account of its remarkably durable wood, which is highly resistant to the attacks of insects. It is yellowish or reddish, hard and dense and is used in cabinet work and in the making of musical instruments. Some writers believe it is the «cedar» and also the «gopher» wood mentioned in the Bible. *C. tortulosa* is probably the tallest species; it is a native of the Himalayas and attains a height of 150 feet. The hardiest species and perhaps the one most frequently planted is *C. macnabiana,* a bush with several small trunks or a small, dense, pyramidal tree of about 20 feet. It is a native of California, where it is very popular in private grounds and public parks. Another popular Californian species is *C. macrocarpa,* generally known as the Monterey cypress. It usually grows about 40 feet tall but occasionally nearly doubles that height. It thrives well even upon poor soils and makes a rapid growth under favorable conditions, but is more susceptible to frost than the preceding species. Numerous horticultural varieties of diversely colored foliage, and varying habit and height have been developed. *C. funebris,* a native of China, ranks about with the last-mentioned species in hardiness, rather excels it in height and is frequently planted on account of its wide-extending, pendulous branches and twigs. The cedar of Goa (*C. lusitanica*) is of unknown habitat but is frequently planted in southern Europe.

The bald or deciduous cypress (*Taxodium distichum,* formerly called *Cupressus disticha* and *Schubertia disticha*) is one of the most valuable of American timber trees, its straight and close-grained, soft, brown wood being highly esteemed where exposure to moisture is expected and where durability but not great strength is demanded. It is very largely used in greenhouse construction. Its range is from Delaware to Missouri and southward to the Gulf States and is especially abundant in swamps, but will thrive with a more or less noticeable change of habit in dry ground. It is a highly ornamental tree often 150 feet tall and sometimes more than 10 feet in diameter, with buttressed trunk, brown, flaky bark, erect or spreading branches bearing narrow light green leaves, purplish staminate flowers and nearly globular cones. The spread of the branches in old specimens is often more than 80 feet. It has developed a large number of horticultural varieties and is very popular as a park tree as far north as New York, about its northern limit of hardiness. In the southern swamps the trees develop «knees» from their roots. These knees, which are sometimes 10 feet tall, are supposed to act as aërators, but their function is not definitely known. When fully developed their tops are above high-water level.

The species of *Chamæcyparis* best known as cypress are *C. obtusa,* the hinoki cypress, and *C. pisifera,* the Sawara cypress. *C. lawsoniana,* the Orford cedar, was formerly known as *Cupressus lawsoniana.* It is a native of the Pacific coast States; the other two are natives of eastern Asia. They attain heights of about 100 and 120 feet respectively, have developed numerous horticultural varieties and are frequently planted in parks for their ornamental foliage and graceful habit of growth. See CEDAR.

Cypress Vine. See IPOMŒA.

Cyprian, sĭp'rĭ-an, **Saint (Thasius Cæcilius Cyprianus),** African bishop, martyr and one of the fathers of the Church: b. about 200; d. Carthage 14 Sept. 258. He was of patrician parentage, and inherited a considerable estate. Having received the highest education he professed rhetoric with eminent success in Carthage and in his school held disputations with representatives of the schools of philosophy and with believers in the Christian religion, with the result that he applied for admission in the Church. Shortly after being baptized (246) he was ordained priest and then was elected by the Christians of Carthage to be their bishop (248). In the persecution of the Christians by Decius (249–51) he prudently withdrew from Carthage and lived in concealment, but on the accession of Gallus (251-3) he returned to his see. There had been lively controversies among the churches over the question of readmission to the Christian communion of those who in times of persecution had renounced the religion of Christ; churches in Asia Minor and churches in Africa, among them the church

of Carthage, had in synods and in the letters addressed by their bishops to other bishops, strongly condemned the practice of some churches, among them that of Rome, in accepting as valid the baptism conferred by heretics. On the question of readmitting the *lapsi* to communion Cyprian favored leniency: he would readmit the fallen on proof of sincere repentance. But he would not acknowledge the validity of baptism conferred by an heretical minister. On this point he was at variance with the tradition and practice of the Church of Rome, and in support of his view he sent to Pope Stephen the acts of a synod of Carthage in which the invalidity of baptism conferred by heretics was declared. Pope Stephen replied that the tradition of the Church was opposed to this and bade Cyprian not to innovate, but to recognize as true and valid baptism administered by heretics if given in the name of the Trinity. Firmilian, a contemporary, states that Stephen threatened Cyprian with excommunication. To the threat the bishop of Carthage replied with great heat, but in the entire controversy on rebaptism he never calls the authority of the Pontiff in question, although he laments what he calls the injustice of the decision. In this controversy the final decision of the Roman Catholic Church was in favor of Stephen: that decision was rendered in the Council of Arles (314) and in that of Nice (325). In the reign of Valerian a new persecution of the Christians was decreed, and Cyprian being arrested and brought before the proconsul refused to sacrifice to the gods and was beheaded 14 Sept. 258; his day in the Roman calendar is 16 September, which day he shares with Pope Saint Cornelius.

Cyprinidæ, sĭ-prĭn'ĭ-dē, a family of fishes (the minnows) of the order *Plectospondyli.* The body is covered with cycloid scales, the head naked; the mouth is toothless and the maxillary bone does not enter its margin; the lower pharyngeal bones are large, elongated and bear one, two, or three series, of a few teeth each; the dorsal fin is short and there is no adipose fin. The intestine is usually normal, but one genus (*Compostoma*) is unique in having its coils passed around the swim bladder. The number of genera and species is estimated at 200 and 1,000 respectively, and in point of numbers they are the most important fresh-water fishes of Eurasia and North America, swarming in every brook, river, and pond. Some of the Old World species reach a large size but the American ones are mostly very small, only a very few ever exceeding a foot in length. They have little importance commercially, but are vastly important in nature, as they furnish the food supply of larger fishes, many birds, etc. Sexual dimorphism is very generally displayed during the breeding season in the spring, when the males become ornamented with epidermal warts and tubercles on the head and elsewhere, and their fins become bright red, yellow, or silvery. Thirty-five genera and about 250 species are recorded by Jordan and Evermann as belonging to the North American fauna. Among them are the different varieties of minnows, dace, shiners, chub, and roach (qq.v.).

Cyprinodon'tidæ (Gr. «carp-toothed»), a family of fishes, order *Malacoptera,* sub-order *Abdominalia.* Although the dentition of the family resembles that of the carp, the jaws are more retractile and toothed. *Fundulus* is the most prominent genus of the family.

Cypripedium, a genus of plants of the natural order *Orchidaceæ.* The genus has about 40 species, 10 of them occurring in North America, and known generally as lady's-slippers. In medicine the term is applied to the rhizomes and rootlets of several species of *Cypripedium.* The root contains a volatile oil, tannic, and gallic acids, and is used as a mild antispasmodic, for much the same purposes as valerian.

Cy'pris, a fresh-water crustacean, typical of the *Cypridæ,* of the order *Ostracoda.* It is sometimes called water flea, and has an unsegmented body, seven pairs of appendages, a rudimentary abdomen, and a bivalve enclosing all. The shell is dainty and elastic; the posterior antennæ bear a long tuft of bristles on their second joint; the second pair of maxillæ have a small gill-appendage; and the posterior limbs are very irregular. *C. pubera,* the largest form, measures about one tenth of an inch. Some species, including *C. fusca* and *C. pubera,* reproduce by parthenogenesis in summer and autumn, the males being transient; while others, notably the *C. ovum,* the males are found throughout the year, and parthenogenesis seems not to occur. The eggs are usually laid in masses on stones and water-plants. The adults are said to be able to survive desiccation, and this is true of the eggs. Some species are very abundant as fossils in fresh-water strata.

Cyprus, an island under British control, lying south of Asia Minor, and the most eastern in the Mediterranean, near the mouth of the Bay or Gulf of Iskanderun. Stretching from southwest to northeast, it is about 148 miles long, with a width varying from 100 miles to 15 miles at a narrow peninsula in the north. Area 3,584 square miles. The main physical features of Cyprus consist of a range of mountains running along a large part of the northern coast, and a range parallel to it occupying a considerable part of the island on the south, with a broad tract of plain, called the Messaria, between, extending on either side to the sea. The second range culminates in Mount Troödos (6,406 feet). Cyprus is deficient in water, its streams being chiefly mountain torrents, which dry up in summer. The climate is in general healthy, excepting in various places during the heats of summer, which, causing a rapid evaporation, give rise to malarial fever. The forests were formerly very extensive, and in ancient times yielded wood much valued by the Phœnicians for ship-building, but owing to indiscriminate cutting, the depredations of goats, etc., they now cover a comparatively small area, with the result that the fertility of much of the soil has been impaired. The forests are now under government supervision, and eucalypti, pines, and other trees are being planted. Agriculture is in a rather backward state, but various vegetables are raised. The cultivation of the vine and the production of wine is increasing, most of it being sent to Egypt and France. Much mischief is sometimes done by locusts, but measures have been taken, under the supervision of the government, by

which their numbers have been greatly diminished in recent years. The extensive pasture lands of the island support numbers of sheep and goats. Cyprus possesses much mineral wealth, and in early times was celebrated for its copper, a metal the English name of which can be traced to that of this island. The copper is again being worked, as are also quarries of sandstone, marble, granite, limestone, etc. Salt in large quantities is obtained from works at Limasol and Larnaca. The sponge-fishery is of some importance. In addition to wine the chief articles of export are carobs, cotton, silk cocoons, cereals, raisins, skins, wool, cheese, and fruits. The imports are cottons and other manufactured goods. Education is being attended to by the government and about $22,000 is expended annually in government grants, three fourths to Christian and the remainder to Moslem schools. There are five high schools and fully 300 elementary schools. Roads and telegraphs have been constructed throughout the island, but there are no railroads. Cables connect it with Syria and Egypt. About one fourth of the people are Mohammedans, the rest are mostly members of the Greek Church.

The Phœnicians established themselves in Cyprus about 1100 or 1200 B.C. Greek colonists followed later; and for a time it was under Assyria. The Phœnicians introduced the worship of Astarte, which afterward passed into that of the Greek goddess Aphrodite (Venus). Amasis brought the island under the Egyptian yoke, 550 B.C. In 525 B.C. it was subdued by Cambyses and annexed to the Persian empire, but it again became a dependency of Egypt under Ptolemy Soter toward the end of the 4th century B.C. In this condition it remained till the year 57 B.C., when it was made a Roman province. After the division of the Roman territories Cyprus continued subject to the eastern empire. In 1182 Isaac Comnenus, a prince of the imperial family of Constantinople, made himself independent, but the island was wrested from him in 1191, during the third Crusade, by Richard I. of England, who afterward bestowed it upon Guy of Lusignan on condition of his renouncing his claim to the title of king of Jerusalem. After the extinction of the legitimate male line of Lusignan, James, an illegitimate descendant, became the ruler. His wife was a Venetian (Catharine Cornaro), and as she had no children, at his death the Venetians took advantage of this circumstance to make themselves masters of the island (1489). They enjoyed the undisturbed possession of it till 1571, when, in the reign of Selim II., notwithstanding a brave resistance on the part of Marco Antonio Bragadino, who defended Famagusta 11 months, it was conquered by the Turks and annexed to the Ottoman empire. In 1830 it was taken by the viceroy of Egypt, but was retaken by the Turks in 1840, and retained by them till June 1878, when it was ceded to Great Britain by the Convention of Constantinople, concluded during the negotiations consequent on the Russo-Turkish war of 1877–8. It still nominally forms a part of the Turkish dominions, the agreement being that it should be administered by Great Britain so long as Russia should retain possession of Batoum and Kars. Great Britain was also bound to pay a subsidy to the Porte, which amounts annually to £92,868. It is not paid directly, however, but retained as an offset against British claims against Turkey. In 1882 a new constitution was framed by the British government for Cyprus. By this a legislative council consisting of 12 elected and 6 official members is appointed, and is presided over by the high commissioner. Of the 12 elected members 9 are Christians and 3 Mohammedans. The yearly budget is laid before the council, and no new tax is to be imposed or existing tax increased without the vote of the council. Control is, however, reserved from the council over such permanent charges on the revenue as the amount of tribute payable to Turkey, the salaries of the high commissioner, judges, the official members of the council, etc. To provide for special emergencies and matters of international concern, power is reserved to the British sovereign to legislate for the island by order in council. The island is divided into six districts, each presided over by a commissioner, and each having a district court. In recent years a vast quantity of interesting archæological objects have been found in Cyprus. Pop. about 300,000.

Cypsel'idæ. See SWIFT.

Cyrano de Bergerac. See BERGERAC, CYRANO DE.

Cyrenaica, sĭr-ē-nā'ĭ-ka, anciently a Greek state in the north of Africa, west of Egypt, comprising five cities (Pentapolis), among which was Cyrene, a Spartan colony. During the most flourishing period of the history of the city of Cyrene that town held in nominal subjection the whole of Cyrenaica, or the country lying between Carthage on the west, Egypt on the east, and Phazania (Fezzan) on the south, with the Mediterranean for its northern boundary. But the Greek colonists actually occupied no more than the elevated district in the north, now called Jebel Akdar, along with the adjacent coast. Cyrenaica remained independent at first as a monarchy under a dynasty of kings, the successors of Battus, who led the first colony to Cyrene, afterward as a republic, until it was subdued by Ptolemy, the son of Lagus, and annexed to Egypt 321 or 322 B.C. By the will of the last king of Cyrenaica belonging to the Ptolemaic dynasty, it was left to the Romans, 95 B.C., who, about 20 years later, erected it along with Crete into a Roman province. Under Constantine it was separated from Crete and made a province by itself. See CYRENE.

Cyrenaics, or **Cyrenians,** a sect of ancient philosophers, whose founder was a disciple of Socrates, being Aristippus, a native of Cyrene, in Africa, after which city his followers were called. His great maxim was, that a man ought to control circumstances, and not be controlled by them. He held that the sum of life was made up of pleasure and pain; the one to be sought after as good, the other to be avoided as evil. The chief good then, was the greatest number of agreeable perceptions; and the true philosopher the man who actively and successfully pursued pleasure. Every act was regarded as morally indifferent, and only to be viewed as it produced pleasure or pain to the individual. The chief successors of Aristippus were Theodorus, Hegesias, and Anniceris, each of whom became the founder of a sect known respectively as the Theodoran, Hegesian, and Annicerian schools. As cynicism was the forerunner of

stoicism, so cyrenaicism paved the way for epicureanism, which constitutes its chief merit.

Cyrene, sī-rē'nē, in Greek mythology, the daughter of Peneus, who was carried by her lover Apollo into Africa, and gave name to that part called Cyrenaica.

Cyrene, in ancient times a celebrated city and the capital of Cyrenaica, in Africa, about 10 miles from the north coast, founded by Battus and a body of Dorian colonists, 631 B.C. Numerous interesting remains have been discovered here, including a bath, two temples (supposed to be of the Roman period), and a magnificent necropolis, containing grottoes, façades, and monuments of various kinds. In one of the grottoes are several curious paintings. Cyrene was the birthplace of Aristippus, Carneades the philosopher, Eratosthenes, and Callimachus the grammarian. The town now occupying the site of the ancient Cyrene is a miserable place in the regency of Tripolis. See CYRENAICA.

Cyre'nius, a Greek form of Publius Sulpicius Quirinus, named in Luke ii. as governor of Syria. He received his appointment as governor in 6 A.D., but the difficulty in harmonizing this with Luke is obviated by admitting that he had been governor also at an earlier date — according to Zumpt, from 4 B.C. to 1 B.C.

Cyril, sĭr'ĭl, **Saint,** patriarch of Alexandria, and one of the fathers of the Church: b. Alexandria 376; d. there June 444. He was patriarch of Alexandria from 412, when he succeeded to his uncle Theophilus in that station, till his death. He was a very zealous champion of orthodoxy and a fiery adversary of Nestorius, Eutyches, and all the heresiarchs and heresies of his time. So intemperate was his zeal for orthodoxy and for the extermination of dissent from the creed of Nicæa, Chalcedon, and Constantinople, that it has brought down upon him the animadversion of some modern Church historians and has given material for historical novels in which imagination fills in what was lacking in the portrait of Saint Cyril drawn by his contemporary adversaries. Among modern Protestant writers Dean Milman in his 'History of Latin Christianity' presses against him charges of barbarity, persecution, and bloodshed, on account of which Cyril, though styled saint, must be esteemed "one of the worst heretics against the spirit of the gospel." He is charged with having closed the churches of the Novations and seized their church property; with having with an armed rabble wrecked the synagogues and driven the Jews in thousands out of the city; with having excited such tumults that the authority of the governor of Egypt, Orestes, was for a time defied. The murder of the illustrious Hypatia, neo-platonist philosopher and adversary of the Christian Church, is not alleged to have been instigated by him, but it is regarded as the inevitable sequel to his violent acts and speeches; and the perpetrators of it were, it is alleged on the authority of contemporaries, "officers of his Church." It is further charged that he was attended at Ephesus, on the occasion of the council of the Church held there in 431, by a rabble of followers, presumably to overawe the fathers, over whom he himself presided: in that council he procured the condemnation of Nestorius, followed by deprivation and banishment by the emperor. The works of Cyril, in the edition published at Paris in 1638 (7 vols.) consist of commentaries, treatises, homilies, and epistles. Cyril holds high rank among the Church fathers as a theologian.

Cyrillus and **Methodius,** apostles of the Slavs. They were brothers, and natives of Thessalonica. Cyril was the name adopted as a monk by Constantine, b. 827. For his learning he was surnamed "the philosopher." The Khasars, a Tartar people, having about the year 860 asked the Emperor Michael III. to send them Christian missionaries, Cyril was sent and made many converts. The Bulgarians of Thrace and Mœsia were evangelized by Methodius, who baptized their king Bogoris in 861. At the request of Ratislav, Duke of Moravia, the brothers then turned to the countries on the March and Danube. They prepared a Slav translation of the Scriptures and chief liturgical books (which became the foundation of the literature of the Slavs), and by their services in the mother-tongue won the hearts of the people from the Roman missionaries. The two brothers were summoned to Rome to explain their conduct; in conducting services in the vernacular, and Cyril died there in 869. Methodius, who in the same year was consecrated bishop of the Moravians, completed the evangelization of the Slavs. Called to Rome in 879 to justify his celebration of the mass in the native tongue, he succeeded in gaining the approval of Pope John VIII., and (according to the most probable account) d. Hradisch on the March 6 April 885. Bohemia and Moravia celebrated the millenary festival of their two apostles on 5 July 1863. Both brothers are recognized as saints by the Roman Catholic Church. Their festival falls in the Roman Catholic Church on 9 March; in the Greek Church 11 May. The Cyrillic alphabet, modified out of the Greek by Cyril, superseded the more ancient Slavonic alphabet over a wide area. The history of Cyril and Methodius is still very obscure. See Ginzel, 'Geschichte der Slawenapostel Cyril und Method' (1857); Dümmler and Miklosich, 'Die Legende vom Heiligen Cyril' (1870).

Cyril of Jerusalem, Saint, Greek father of the Church: b. Jerusalem about 315; d. there about 386. After his ordination to the priesthood in 345 his special office was to instruct the catechumens, both those who were to be prepared for admission to the Christian communion through baptism and those who after baptism were to be inducted into knowledge of the mysteries of the Christian religion, especially the mystery of the Eucharist. This occupation led to his writing his book of 'Catecheses,' one of the most interesting monuments of the ecclesiastical literature of that time. He was made bishop of Jerusalem in 350. Twice he was deposed and sent into exile by imperial decree because of his unflinching zeal for the creed of Nicæa as against the Arian party, first in the reign of Constantine II. and then in that of Valens. On the accession of Theodosius in 379, he was restored to his see and there remained till his death. At the ecumenical council of Constantinople (381) he was received with acclamations by the fathers as a confessor of the faith who had gladly suffered persecution

for the truth's sake. His 'Catecheses,' or catechetical lectures are 23 in number, of which 18 are for the instruction of catechumens in the stage of preparation for baptism, while the remaining five, called the 'Catecheses Mystagogicæ,' treat, as their title imports, of the mysteries of the Christian religion. The work, translated into English, is one of the volumes of the Oxford 'Library of the Fathers.'

Cyrilla, a genus of shrubs consisting of one variable species, *C. racemiflora,* of the natural order *Cyrillaceæ.* The shrubs are found from the Carolinas westward to Texas and southward to Brazil. They are almost evergreen, and have attractive bright green leaves and white flowers in racemes. Popularly they are known as leatherwood and are sometimes seen in ornamental plantings as far north as New York, which is about the limit of their hardiness. They succeed best in moist, sandy soil and partial shade.

Cyrillian Letters, a kind of Slavonian alphabet, more properly called Kirillitsa, used in Russia, Servia, and Bulgaria, with some modifications. Tradition makes them the invention of St. Cyril in the 9th century, but modern research points toward the fact that the name was originally used of the rival alphabet, the Glagolitic or Glagolitsa. But the form now known as Cyrillian is much nearer the modern alphabet of the three Slavic peoples mentioned.

Cyrus, king of Persia: d. 529 B.C. The only ancient original authorities for the facts of his life are Herodotus and Ctesias. According to Herodotus he was the son of Cambyses, a distinguished Persian, and of Mandane, daughter of the Median king Astyages. He founded the Persian monarchy. A short time before his birth the soothsayers at the court of Astyages divined from a dream of his that his future grandson was to dethrone him. Upon this he gave orders that Cyrus should be destroyed immediately after his birth. For this purpose he was delivered to a herdsman, who, moved with compassion, brought him up, and named him Cyrus. His courage and spirit betrayed his descent to the king. The Magi having succeeded in quieting the uneasiness which the discovery occasioned him, he sent Cyrus to his parents in Persia, with marks of his favor. But Cyrus soon drew together a formidable army of Persians, and conquered his grandfather (559 B.C.), and thus became king of Media and Persia. In 546 he conquered Crœsus, the rich and powerful king of Lydia, and in 538 took Babylon after a siege of two years. He also subdued Phœnicia and Palestine, to which he caused the Jews to return from the Babylonish captivity. While Asia, from the Hellespont to the Indies, was under his dominion, he engaged in an unjust war against the Massagetæ — a people of Scythia, northeast of the Caspian Sea, beyond the Araxes, then ruled by a queen named Tomyris. In the first battle he conquered by stratagem, but in the second was defeated, and was himself slain (529 B.C.). The stories related by Xenophon in the 'Cyropædia' (professing to be an account of the life and character of Cyrus), that he received a splendid education at the court of Astyages, inherited his kingdom, and ruled like a genuine philosopher, are mere romance, Xenophon's design being to represent the model of a king, without regard to historical truth, and in this way perhaps to exhibit to his countrymen the advantages of a monarchy. The chief points in which the account of Ctesias differs from that of Herodotus are that Ctesias does not make Cyrus any relation of Astyages, that after the conquest of Media Cyrus married Amytis, the daughter of Astyages, and honored the latter as a father, and that he met his death in a battle with a nation called the Derbices, who were assisted by the Indians. Ctesias also mentions certain wars of Cyrus not related by Herodotus, and gives a somewhat different account of the war with Crœsus, king of Lydia.

Cyrus, called the Younger, king of Persia: b. about 424 B.C.; d. 401 B.C. He was the second son of Darius Nothus, or Ochus, and at 15 obtained the supreme power over all the provinces of Asia Minor. His ambition early displayed itself; and when, after his father's death (404 B.C.), his elder brother, Artaxerxes Memnon, ascended the throne, Cyrus formed a conspiracy against him, which was, however, discovered. Cyrus was arrested by his brother and condemned to death, but at the intercession of his mother Parysatis, was released, and made governor of Asia Minor. Here Cyrus assembled a numerous army to make war upon Artaxerxes and dethrone him. Being informed of his brother's design, Artaxerxes marched against him with a much larger army. In the plains of Cunaxa, in the province of Babylon, the two armies encountered each other (401 B.C.). In the battle that ensued the troops of Cyrus were at first victorious, but the fruits of the victory were lost through the death of Cyrus himself in the battle. An account of the life of Cyrus is contained in the opening book of Xenophon's 'Anabasis,' which gives a detailed account of the retreat of the Greek auxiliaries of Cyrus from the interior of Persia to the coast of the Black Sea.

Cys″tadeno′ma. See TUMOR.

Cysticercus, sĭs-tĭ-sẽr′kŭs, a larval stage of the tapeworm, sometimes found in the human body in the form of small-sized tumors, and which may be distributed in a variety of situations. The tumors may range from the size of a pea to that of a hazelnut, and may exist singly or may be multiple. They are found chiefly in the back and sides of the trunk, less frequently in the extremities, and are sometimes subcutaneous. Occasionally they involve the brain and other organs, as the liver, kidneys, spleen, etc. Frequently they give rise to no symptoms whatever, but when occurring in an important organ of the body may cause major symptoms. In the flesh of many of the lower animals cysticerci also frequently occur, and it is by those present in the meat which he eats that tapeworms are largely communicated to man.

Cystinu′ria, a condition in which large amounts of cystin are found in the urine. It is a very rare condition, and is usually associated with excessive intestinal putrefaction. Sometimes cystin calculi result because of the excess of this acid in the urine.

Cysti′tis, an inflammation of the urinary bladder, usually resulting in pain and increased desire to urinate. The urine may be cloudy or bloody, and there is usually an excess of mu-

cus and pus found. The pain is situated over the pubic bone and may extend to the back, and there may be some associated fever with chills, if the inflammation is severe. Cystitis is most frequently due to an infection from without, usually the result of passing an unclean catheter. It may also result from urethritis, and is a very common condition in old men in whom the prostate gland is enlarged. It may also result from the presence of a stone in the bladder. Treatment is often difficult, requiring skilled medical attendance; but sitz-baths and hot applications to the abdomen are of service, and abstinence from peppery or alcoholic foods is advisable.

Cystoi'dea, an order of extinct echinoderms. They are spheroidal animals, pedunculate or sessile, enclosed by polygonal calcareous plates. They have a mouth above; the arms are rudimentary. Buch first elucidated their structure and affinities in an essay published at Berlin, in 1845, and gave them the name of *Cystideæ* in place of *Sphæronites,* which was their original appellation. Now *Cystideæ* has become *Cystoidea.* They range from the Upper Cambrian to the Silurian, being especially prominent in the Bala Limestone.

Cystop'teris, bladder-fern, a genus of delicate flaccid polypodiaceous ferns. They are found in moist, cool localities. Two are natives of Great Britain, *C. fragilis* (the brittle fern), common, and *C. montana,* very rare. The brittle fern has a wide range, being found within the Arctic circle to Chile, south Africa, and Australasia. They have dot-like sori covered by coral-like indusia.

Cysts, circumscribed tumors containing more or less fluid substance, or occasional gases, cut off from the neighboring tissues by a distinct limiting wall. See TUMORS.

Cy'tase, a ferment or enzyme that exerts a kind of digestive action upon the cell-walls of plants, rendering them soluble in water. It occurs in the hyphæ of certain parasitic fungi, and also in the germinating seeds of certain plants in which the reserve food-material is normally stored up in masses of stony hardness. It dissolves cellulose, but has no effect upon lignin, and is destroyed by exposure to a temperature of 150° F. The chemical nature of cytase is not yet established, and it may prove to be a mixture of several enzymes instead of a single substance of definite composition.

Cythere, sī-thē'rē, a genus of *Entomostraca,* order *Ostracoda,* family *Cytheridæ.* The eye is single, the inferior antennæ setigerous, but without a tuft or pencil of tiny filaments; three pairs of feet are enclosed within the shell, and no heart is present.

Cytherea (from Cytherea, a name for Venus), a genus of conchiferous mollusks belonging to the family *Veneridæ.* The shell is like that of the genus *Venus.* There are three cardinal teeth and an anterior one beneath the tunicle. The cythereas are in all seas; 176 recent species are known, and 200 fossil, the latter ranging from the Oölite down.

Cytisin, sĭt'ĭ-sĭn ($C_{24}H_{27}N_3O$). When the ripe seeds of laburnum are powdered, extracted with acidulated water, the fluid treated successively with lead acetate and tannic acid, and the precipitate, before it becomes resinous, mixed with lead oxide, then dried and exhausted with alcohol, crude cytisin is obtained on evaporation, and after proper purification it forms a brilliant crystalline mass. It is very soluble in water and alcohol, but insoluble in ether, benzol, and chloroform, has a bitter taste, but no odor. It is a very powerful base, decomposing the salts of ammonia and the metals even in the cold. It combines with the strong acids, but the salts are all deliquescent except the nitrate, which crystallizes very readily in splendid, thick, transparent, colorless, monoclinic prisms. It can be sublimed without decomposition by careful heating in a current of hydrogen. The poisonous properties of laburnum are well known. The toxicological effects are due to this alkaloid, which in doses of from 0.1 to 0.5 of a grain is fatal in a few minutes to ordinary small animals.

Cytisus, sĭt'ĭ-sŭs, a genus of low shrubs or small trees of the natural order *Leguminosæ.* There are about 40 species, natives mostly of Europe, western Asia and northern Africa. They are characterized by small, deciduous or evergreen trifoliate leaves, yellow, purple or white flowers in terminal or axillary racemes or heads, and few- to many-seeded pods. Several species with long twiggy branches are called broom; others are popularly known as laburnum and others by the genus name. A good many are cultivated for ornament either in shrubberies or in greenhouses, where some, especially *C. canariensis,* are known as genistas and are very popular about Easter time. In Europe several species are valued as forage plants, but in America they have not met the expectations of experimenters. See BROOM; GENISTA.

Cytode, sī'tōd, a piece or bit of protoplasm, defined by Haeckel as without a nucleus. In this respect it differs from a cell. The monera of Haeckel are cytodes which have not yet reached a cell-stage. At present, although the nucleus of some of the monera has not been detected, it is supposed that they may yet be found to be provided with it. A cytode is thus a provisional unit of organization.

Cytology, the science which deals with the structure, development, and functions of the cell; of the multiplication of cells and of the relations of cells to organs and tissues. It is distinguished from histology in that histology deals with tissues, while cytology deals rather with the cells of which tissues are composed. A sharp distinction cannot be made between cytology and morphology, although in general it may be said that cytology is concerned more with individual cells than with organs. Cytology may be called "oil immersion" morphology, because microscopes with very high magnifying powers are required for cytological studies. The terms, cytology and morphology, are used very indiscriminately by many botanists and zoologists. During the past 10 years, most botanical studies with such titles as "The Morphology of —," contain more or less cytology, while only a smaller number of articles purporting to be cytological, are largely morphological. Among the problems which belong indisputably to cytology are the following: The origin, development, structure, and functions of the cell and of its various constituents; nuclear and cell division; fertilization; organization of the embryo; the relation of the individual cell to cell complexes; the role of the cell in heredity.

An idea of the subject matter of cytology can best be gained by examining, from the cytological standpoint, a few prominent subjects which are also studied by investigators in other fields. See EMBRYOLOGY, FERTILIZATION, HEREDITY (*Cell*), etc.

The Cell.—A cell has been defined as "a mass of protoplasm with a nucleus in it." While this is true for many simple forms, there is in addition, in the vast majority of cases, a cell wall surrounding the protoplasm. (FIG. 1.)

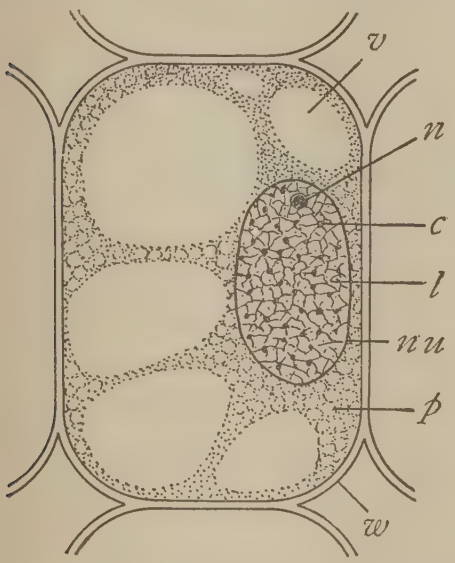


FIG. 1

FIG. 1.— A cell illustrating the parts which are common to nearly all cells. Highly magnified. *v*, vacuole; *n*, nucleolus; *c*, chromatin; *l*, linin; *nu*, nucleus; *p*, protoplasm; *w*, cell wall.

Cells without nuclei were reported frequently about 30 years ago, but at present no animal cells without nuclei are known. Numerous cases of non-nucleate cells were reported by the older botanists, but as lenses and methods of preparation have improved, nuclei have been demonstrated until the only doubtful cases now known to the botanist are the blue-green algæ and the bacteria.

Most cells are too small to be seen without a microscope, cells which are visible to the naked eye being rather exceptional. The egg of a bird consists of a single cell, as do the eggs of all animals and plants. The largest plant cells are the internodal cells of the stonewort, *Chara*, which reach a length of two inches. The largest egg cell described for any plant is that of *Zamia*, a plant related to the sago palm; this cell reaches a length of about one eighth of an inch.

The most usual shape of free cells is the spherical, and cells forming a part of a tissue are usually more or less rectangular in form.

When first formed, the cells of the individual animal or plant are very much alike, but as one examines cells farther and farther from the regions where active cell multiplication is taking place, it is seen that the originally similar cells are becoming very unlike. In the higher plants the outer cells become differentiated into protective tissue, the innermost into conductive tissue, others into assimilative tissue and still others become reproductive cells. In higher animals similar differentiations take place, cells which finally become so different, as those which form nerves, muscle, glands, and even the teeth, having been practically alike in the beginning. Among the unicellular organisms there is often a remarkable differentiation and division of labor, the single cell performing the functions of locomotion, securing food, respiration, digestion, assimilation, etc. Such differentiation and the causes which lead to it are among the most important of cytological problems.

It is a remarkable fact that while undergoing nuclear division, the cells of animals and plants strikingly resemble one another, even in the behavior of the most minute constituents of the nucleus and protoplasm. (FIG. 2.) This

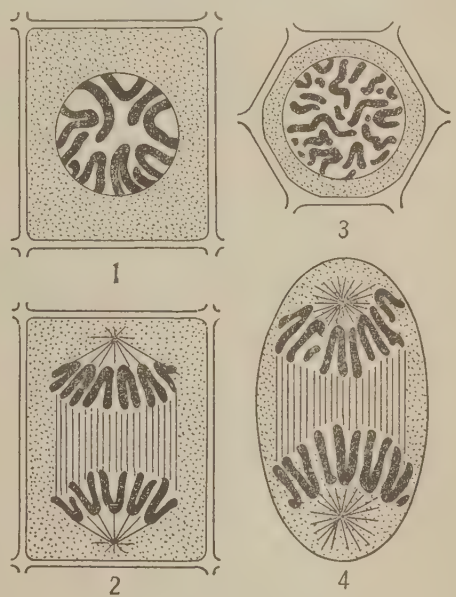

FIG. 2

FIG. 2.— Cells undergoing nuclear division: 1 an early and 2 a later stage in the division of the nucleus in a cell of the root tip of the common *Onion*. 3 and 4, the corresponding stages in epidermal cells of the *Salamander*. In 2 and 4 the V-shaped chromosomes, which are regarded as the physical basis of heredity, are clearly seen. Highly magnified.

must mean that animals have been derived from plants or that structures of amazing similarity have arisen independently in animals and plants.

Fertilization.—One of the most important problems of cytology is the problem of fertilization and attendant phenomena. While new individuals, even in the more highly organized plants and animals, may arise occasionally without fertilization (by parthenogenesis, chemical stimulus, vegetative multiplication, etc.), such cases are so rare that fertilization is assumed to occur unless its absence is definitely established. To the cytologist, fertilization consists in the union of definitely organized male and female elements. The cytological details of fertilization are essentially alike in plants and animals. (FIG. 3.) Fertilization, both in plants and in animals, is preceded by a reduction in the number of

chromosomes, so that the number of chromosomes found in the male nucleus or in the female nucleus is just one half the number which is found in the body cells of a given plant or animal. Consequently, when the two sexual nuclei fuse during fertilization, the number of chromosomes which characterizes the body cells

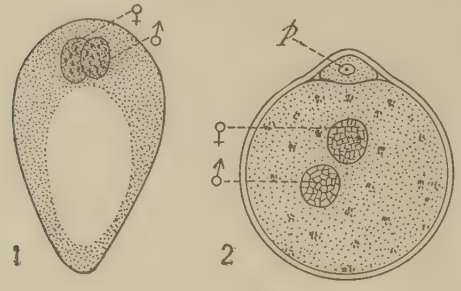

FIG. 3

FIG. 3.— Fertilization. 1, the egg (oosphere) of a *Lily*, showing the male and female nuclei about to unite; 2, the egg of a *mouse* with the male and female nuclei about to unite; *p*, polar body. (2, after SOBOTTA.) Highly magnified.

is restored. The complicated details of the processes by which this reduction in the number of chromosomes is effected, are essentially alike in animals and plants. Those cytologists who have investigated most thoroughly the phenomena of fertilization have come to the conclusion that heredity is referable to a definite cytological basis.

A Cytological View of Heredity.— Almost without exception, cytologists believe that chromatin is the physical basis of heredity. The reasons for this belief are, briefly, as follows: The male and female parents are equally potent in transmitting characters to offspring; an equal amount of chromatin and an equal number of chromosomes are contributed by each parent; nothing but chromatin is contributed equally by the two parents. (FIG. 4.) There is usually a great difference in size between the male and female germ cells. The sperm cell (spermatozoan) of the ostrich is almost invisible to the naked eye, while the egg is as large as a cocoanut, and such differences in size are usual both in plants and animals. The egg contains a large amount of protoplasm and various foodstuffs, while the male cell contains very little protoplasm or foodstuffs and in many cases even that little is left outside at the time of fertilization, only the nucleus entering the egg. Hence, protoplasm and foodstuffs do not transmit hereditary characters. While the male nucleus is usually the smaller at the time of its entrance into the egg, it increases in size so that, at the time of fusion, the sex nuclei are alike in size. (See FIG. 3.) Investigators of this subject are usually tempted into speculative philosophy. Philosophizing over the facts is commendable, but the wild philosophizing in advance of the facts which has attended this subject, has been of little value, except as it has stimulated investigation.

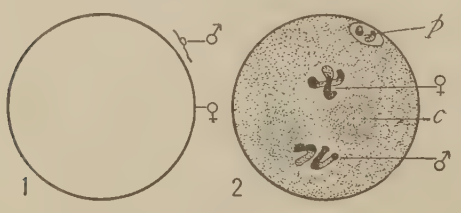

FIG. 4

FIG. 4.— 1, The egg and sperm of *Fucus*, showing great inequality in size; 2, fertilization in a *worm* (*Ascaris*) showing the equal contribution of chromatin, each parent contributing two chromosomes. *p*, polar body; *c*, centrosome. (2 after BOVERI.) Highly magnified.

The organization of embryos and mature organisms from eggs is a cytological problem which has not yet been solved. The visible stages in development have been observed and described *ad infinitum*. Both experimental cytology dealing largely with living material, and anatomical studies of thin sections, stained so as to show the most minute details of structure, are contributing to the solution of the problem, but the fundamental causes underlying the phenomena are still unknown and seem as difficult of solution as the problem of the origin of life. The eggs of the sunflower and the willow, like the eggs of all flowering plants, are too small to be examined with the naked eye, but even when examined with the aid of modern technique and the most powerful microscopes, they present no essential differences in external appearance or internal structure, and yet one always develops into a sunflower, and the other into a willow. Within the fertilized egg are all the potentialities of the adult, even to the color of the flower or the markings on the wings of the butterfly. Some have believed that each part of the adult comes from a certain predetermined part of the fertilized egg. This is called the theory of germinal localization. Others have made experiments to show that this theory is not true. Most botanists and zoologists accept, as a working hypothesis, that chromatin is the physical basis of heredity, an hypothesis which assumes that there is no pre-localization in the protoplasm of the egg. The problem of organization is so bound up with that of heredity that much of the literature of the subject will be found in treatises on heredity.

References.—Cytology is too recent a subject to have given rise to many text-books, most of the literature being in the form of articles in leading botanical and zoological journals. Probably the most important book on the subject is Prof. E. B. Wilson's 'The Cell in Development and Inheritance.' The following headings of chapters in Prof. Wilson's treatise indicate quite accurately the subject matter of cytology as presented in the few universities which offer courses in this subject: (1) General sketch of the cell; (2) Cell division; (3) The germ cells; (4) Fertilization of the ovum; (5) Reduction of chromosomes, oogenesis, and spermatogenesis; (6) Some problems of cell organization; (7) Some aspects of cell chemistry and cell physiology; (8) Cell division and development; (9) Theories of inheritance and development. This book contains a very complete bibliography. Other books on the subject are: Hertwig's 'The Cell' and Häcker's 'Praxis und Theorie der Zellen- und Befruchtungslehre.' All volumes cited above, are by zoologists; no similar books have been written by botanists. A part of the subject is covered by Prof. Strasburger's

book on 'Reduktionstheilung, Spindelbildung, Centrosomen, und Cilienbildner im Pflanzenreich.' The chief scientific journals in which the great majority of cytological investigations are published are: (Botanical), 'Annals of Botany,' 'Botanical Gazette,' 'Jahrbücher für wissenschaftliche Botanik,' 'Berichte der Deutschen Botanischen Gesellschaft,' 'Flora,' and 'Annals des Science Naturelles Botanique,' (Zoological), 'Journal of Morphology,' 'La Cellule.' 'Anatomische Anzeiger,' 'Archives de Biologie,' 'Sitzungsbericht der Gesellschaft für Morphologie und Physiologie München,' and 'Bulletin Acad. Roy. de Belgique.'

CHARLES JOSEPH CHAMBERLAIN,
The University of Chicago.

Cy'toplasm. See CELL.

Cyz'icus, Asia Minor, a peninsula 60 miles southwest of Constantinople. It projects into the Sea of Marmora, and is connected with the mainland by a narrow isthmus, but was once an island and the site of the ancient town of same name, which stood on its south extremity, and of which some remains, including a fine amphitheatre, are still seen. The peninsula, which stretches east to west for 18 miles, with a breadth of about 9 miles, is very beautiful and picturesque.

Czar, zär, **Zar,** or **Tsar,** tsär, the ordinary title of the emperor of Russia, derived from the Old Slavonic *cesar,* king or emperor, which, although long held to be derived from the Roman tital *Cæsar,* is almost certainly of Tartar origin and is a survival of Asiatic dominion in Russia, as may be judged from the fact that there were czars of Georgia and other khanates, evidence of the non-imperial content of the term. In the beginning of the 10th century the Bulgarian prince Symeon assumed this title, which remained attached to the Bulgarian crown. In 1346 it was adopted by Stephan Duschan, king of Servia. Among the Russians the Byzantine emperors were so called, as were also the khans of the Mongols that ruled in Russia. Ivan III., grand prince of Moscow, held the title, and Ivan IV. caused himself to be crowned as czar in 1547. In 1721 the senate and clergy conferred on Peter I., in the name of the nation, the title Emperor of Russia, for which in Russia the Latin word *imperator* is used. But among the Russians the common designation of the emperor is czar, or, as it is more properly spelled, tsar.

Czarina, zär-ē'nä, the title of the wife of the czar of Russia.

Czarovitz, zär'ō-vĭch, or **Czarevitch,** the title of the eldest son of the czar of Russia.

Czartoryski, chär-tō-rĭ'skē, **Adam George,** prince, Polish statesman, and patriot: b. Warsaw 14 Jan. 1770; d. Paris 16 July 1861. His education was completed at the University of Edinburgh and in London. After the partition of his country in 1795 he was sent as a hostage to St. Petersburg. There he formed a close friendship with Prince Alexander, who on his elevation to the throne appointed him minister of foreign affairs and curator of all the educational establishments in Poland. On 11 April 1805 he signed in name of Russia the Treaty of Alliance with Great Britain, after which he resigned his office. On the outbreak of the Polish revolution of 1830 he showed himself active on behalf of his country, and was chosen president of the provisional government (18 December). On 30 Jan. 1831 he became the head of the national government, and gave up the half of his property to the service of his country On the appointment of Krukowiecki to the dictatorship Czartoryski resigned his post as president of the senate. In the last days of the struggle for freedom he served as a common soldier in the corps of Gen. Romarino. Thenceforth he lived at Paris, ceaselessly engaged in aiding his needy fellow-countrymen. He was excluded from the amnesty of 1831, and his estates in Poland were confiscated.

Czaslau, chäs'low, Bohemia. 1. Town, capital of a circle or district of the same name; located in a fertile plain, 45 miles east-southeast of Prague; and is memorable for the defeat which the Austrians sustained from Frederick the Great in 1742. The Church Saint Peter and Saint Paul has the loftiest steeple in Bohemia, and contains the remains of the celebrated Hussite leader, John Ziska. Pop. (1890), 8,388. 2. The circle or district is well wooded and fertile, yielding excellent crops of corn and flax; and large quantities of minerals, especially iron. Area, 233 square miles. Pop. 61,064.

Czech (or **Chekh**) **Language and Literature.** The Czech is a dialect of the Slavonic family of Aryan languages; it is the speech of the people of Bohemia and is spoken also by the Moravians and by the Slovaks of Hungary. It is a language very rich in native radical words which lend themselves readily to combination, and hence the language possesses in itself ample resources for the expression of new ideas without need of recourse to foreign tongues. It has a precise and regular grammatical structure comparable to that of the classical languages; yet like other languages of the Slavonic family it is without a definite form for the passive voice of the verb. The Czech had the rare good fortune in the 15th century of having its alphabetic system constituted according to phonetic laws and as a result each of the letters has a fixed phonetic value, and there are no superfluous letters. To John Hus, who revised the Czech version of the Scriptures is due the credit of setting up a standard both of orthography and of literary expression. Others have since worked on the same lines and now the Czech language is an unexcelled mechanism for the expression of thought.

The language was cultivated for literary production in the 9th century or earlier; but owing to the intrusion of Germanic speech and of Germanic civilization, also to the universal employment of the Latin language by churchmen, the speech of the privileged and the cultured classes was Teutonic or Roman, and the native tongue was for a long time neglected as a means of communication save among peasants and serfs. Hence the literature of Bohemia for centuries was written in Latin and the court speech was German. But there was a remnant of the educated who cherished the mother tongue and kept alive the national traditions; and to them,—and chief among them to the patriotic monks of the abbey of Sazava,—is mainly due the retention of the vernacular speech in its literary forms, and its having been saved from degradation and from becoming the patois of rustics; these monks and patriots saved the literary language from extinction and kept

alive the national spirit of the people by reproducing and adding to the epic and lyric poesy and the chronicles of their Slavonic forefathers.

There are in existence fragments of Czech literature dating from the 10th century; the genuineness of other alleged fragments for which a like antiquity is claimed is disputable; we reach firm ground with the Czech version (about 1245) of the Latin work 'Alexandreis,' written by Philippus Gualterus ab Insulis; contemporary with this are several metrical lives of saints and several legends. To the beginning of the 14th century is referred the lengthy 'Chronicle' of Dalimil,—a versified history of the world from the creation to the year 1314; the author cherished a cordial hatred of the Teutonic race. To the 14th century also belongs a series of pungent 'Satires on Craftsmen,' and a notable epic poem, 'The New Council,' by Smil of Pardubitz, who is also the reputed author of a lively and original 'Dialogue Between a Groom and a Scholar.' There is extant also from the 14th century an important law treatise, 'Exposition of the Law of the Land of Bohemia,' by Andreas Duba, the chief justice of the realm. There are extant translations of books of the Scripture into Czech dating from the 13th and 14th centuries,—mostly of books of the New Testament and the book of Psalms. John Wiclif mentions a copy of an *evangelium* (gospel, probably meaning a book of the four gospels) in Bohemian (Czech), German and Latin, owned by Anne of Luxemburg, sister of the Emperor Charles IV., who was hereditary king of Bohemia: Anne was the first wife of Richard II. of England. There were in existence at this time two Czech versions of the Psalter; the Czech version of the whole Bible was made in the beginning of the 15th century. Another monument of Czech literature in the 14th century is a prose chronicle extending from the earliest times to the year 1330, by the priest Pulkava, which he wrote originally in Latin, but which afterward he translated into his native idiom. The most original of the Czech authors of the same period is Thomas of Stitny, a writer on religious and moral questions; his aim was to popularize the teachings of the schoolmen touching matters of belief and Christian living; the titles of his two principal works are: 'General Christian Matters' and 'Books of Christian Instruction.' Finally, to this age is to be referred a Czech version of the 'History of the Trojan War,' written in Italian by Guido di Colonna, but made up from the works of Dictys Cretensis and Dares Phrygius; this was one of the first works in the Bohemian language to be multiplied by the printer's art (1468).

John Hus (died at the stake 6 July 1415) did for the national tongue of the Czechs what Luther did for that of the Germans. He did not himself translate the Bible into Czech, but made a great many changes in the Czech version of the Bible already in existence, and incidentally systematized the orthography of the language. Like the commotions attending the rise of Protestantism, the Hussite wars called forth a swarm of political and religious manifestoes and tractates. Of more lasting importance were the Czech translations of the 'Travels' of Marco Polo and of Sir John Mandeville, which appeared about the same time. Though the printing press was as yet unknown the 'Postils,' the 'Net of Faith,' and other fugitive pieces of the cobbler, Peter Chelcicky, the Hans Sachs of the United Brethren, had a universal circulation among the masses. In 1487 the printing press was set up at Prague, and the following year the Czech Bible was first printed.

The printing press and the Protestant Reformation stimulated literary activity enormously, and there is room here only for a most cursory review of the field. The first grammar of the Czech language was published in 1533. A work, entitled a 'Chronicle,' but which is in fact a collection of old Czech legends, compiled by one Hajek and published before 1550, became the people's *vade mecum;* it is a treasury of Czech myth. Christopher Harant wrote an account of his travels in the Holy Land, a work of real value, which is not yet antiquated; it was reprinted in 1854. After the subjugation of the Czechs in 1621 by Austria, Czech literature with Czech national spirit went into decline and so continued till their resuscitation in the beginning of the 19th century. The first impulse to the Czech renaissance was given by the philological researches of Joseph Dobrovsky. He wrote, not in the national tongue, but in German and in Latin, and his researches were conducted with purely scientific, philological ends; for he had no thought that the Czech language and literature would ever regain eminent standing, but were doomed to extinction in the struggle for life, in which it had been for centuries engaged; his works he regarded as monuments of a language and a literature that before long must be numbered with the languages and literatures of ancient peoples. But his writings and the labors of his successors in the same field, epecially Joseph Jungmann, author of a noble dictionary of the Czech language and of a history of Czech literature, called forth a national movement that has seldom had a parallel. Since 1809, date of Dobrovsky's first work on the 'Bohemian Language' (*Ausführliches Lehrgebäude der bömischen Sprache*) there has been a great revival of national feeling in the Czech people and of Czech literary activity in all departments, poetry, fiction, folklore, history, drama, antiquarianism, philology, music, moral and intellectual philosophy, natural and physical science. In the University of Prague the national language is a recognized medium of instruction; scientific and literary societies employing the national language are numerous; and the scientific and literary periodicals of Bohemia are both numerous and of the highest class.

Czechs (cheks), the extreme western branch of the great Slavonic family of races. The Czechs have their headquarters in Bohemia, where they arrived in the 5th century. The origin of the name is unknown. The total number of the Czechs (including Moravians, Slovaks, etc.), is about 6,000,000, nearly all of whom live in the Austrian empire. The Czechs proper, in Bohemia, number about 2,700,000. They speak a Slavonic dialect of great antiquity and of high scientific cultivation. The Czech language is distinguished as highly inflectional, with great facility for forming derivatives, frequentatives, inceptives, and diminutives of all kinds, and is very musical. Like the Greek it has a dual number, and its manifold declensions, tenses, and participial formations, with their

subtle shades of distinction, give the language a complex grammatical structure. The alphabet consists of 42 letters, expressing a great variety of sounds.

Czegled, tsē'glād, Hungary, large market town, in the county of Pest, circle of Ketskemet, on a plain between the Danube and Theiss, 39 miles southeast of Budapest. The land in the vicinity is well cultivated, and produces large quantities of grain and common red wine. Pop. (1900) 29,900, mostly Protestants.

Czermak, chĕr'mäk, **John Nepomuk,** German physiologist and physician: b. Prague 17 June 1828; d. Leipsic 16 Sept. 1873. In 1865 he became professor of physiology at Jena, and from 1869 till his death filled a similar position at Leipsic. He was the inventor and introducer of the laryngoscope and rhinoscope, and of a new method for the therapeutical and surgical treatment of diseases of the epiglottis and throat. His work on 'The Laryngoscope' has been translated and published in several languages.

Czernigov, chĕr'nē-gōf, Russia, a province; area 20,243 square miles. The surface, with exception of a hilly district along the Dneiper, is flat and the soil fertile. The Dnieper flows along its west frontier, and the Desna passes through its centre. It has numerous lakes, though none are of great extent. All kinds of grain grow in abundance, but the crops often suffer from hosts of locusts. Hemp, flax, tobacco, and the opium poppy grow well, and the forests furnish timber and fuel. The chief mineral products are saltpetre, porcelain-earth, chalk, and a little iron. The interior trade is almost confined to the four annual fairs, which are held in Nijni-Novgorod. The chief exports are cattle, corn, brandy, honey, wax, and potash. Pop., almost all belonging to the Greek Church, nearly 3,000,000.

Czernigov, Russia, town, capital of the province of the same name, situated on the right bank of the Desna, 80 miles north-northeast of Kiev. It is a place of great antiquity, and contains numerous buildings of antiquarian interest. It is the seat of an archbishop, and has many churches — one of them, St. Sophia, supposed to have been founded in 1024 — three monasteries, a gymnasium, and an orphan hospital. Three important annual fairs are held here. Pop. about 27,000.

Czernowitz, chĕr'nō-vĭts, Austria, capital of the province of Bukowina; 720 feet above sea-level, near the right bank of the Pruth, 165 miles southeast of Lemberg. Among its buildings are the palace of a Greek archbishop; the cathedral modeled after St. Isaac's at St. Petersburg; the Armenian Church; the synagogue; and the "Austria Monument." The university was founded in 1875. The manufactures and trade are steadily developing. Pop. (1900) 67,622.

Czerny, chĕr'nē, **George,** Servian hospodar: b. near Belgrade 21 Dec. 1766; d. July 1817. His true name was George Petrovitch, but he was called Czerny or Kara George on account of his dark color, Czerny in Slavonic, and Kara in Turkish, signifying black. In 1788, as the leader of a Servian volunteer corps, he fought in the Austrian army against the Turks, and in 1801 returned to his native country and organized an insurrection with the view of delivering it from the Turkish yoke. He succeeded in driving the Turkish garrisons out of Servia, took the town of Belgrade, and compelled the Porte to recognize him as hospodar of Servia. When the Turks again invaded Servia, in 1813, he was compelled to retire. In 1817 he ventured to return to his native country, in the hope of inducing Milosh Obrenovitch, who had meanwhile received Servia as a vassal state from the Turks, to take part in a comprehensive scheme of rebellion; but Milosh betrayed him to the pasha of Belgrade, who caused him to be assassinated.

Czerny, Karl, Austrian pianist and composer: b. Vienna 21 Feb. 1791; d. there 15 July 1857; son of a teacher of the pianoforte. He was the author of an immense number of pieces, which, from their brilliancy, were at one time extremely popular. His exercises for the pianoforte are still valuable. Among his pupils were Liszt, Döhler, and other distinguished musicians.

Czerny, or **Tcherny,** a Slavonic prefix sometimes signifying *black,* and sometimes *tributary,* appearing in many geographical names, as Czernigov, Czernowitz. It corresponds in the former meaning to Turkish Kara, Czerny George and Karageorge being interchangeable.

Czolgosz, chōl'gōsh, **Leon,** American assassin: b. Detroit, Mich., 1873; d. Auburn 29 Oct. 1901. He was of Polish-German ancestry; worked at various trades in the United States and became affiliated with anarchists through the teachings of Emma Goldman (q.v.). On 6 Sept. 1901, while President McKinley was holding a public reception at the Pan-American Exposition in Buffalo, N. Y., Czolgosz shot him twice. On 14 September the President died; on 23 September Czolgosz was brought to trial; on the 26th was sentenced to death, and was executed in the prison at Auburn, N. Y.

Czuczor, tsoo'tsōr, **Gergely,** Hungarian poet and philologist: b. Audod 17 Dec. 1800; d. Pest 9 Sept. 1866. His two fine hero-ballads, 'The Battle of Augsburg' (1824) and 'The Diet of Arad' (1828), brought him instant celebrity. He was a Benedictine monk, and the eroticism of the first collection of his 'Poetical Works' (1836) brought on him stern animadversion from his superiors. In 1848 he published 'Reveil,' a passionate appeal to Hungarian national sentiment, and was imprisoned for it.

D

D the fourth letter of the English alphabet and the third consonant, is a sonant dental corresponding to the mute dental T. It holds the same place in the alphabets of the Phœnician, Syrian, Chaldee, Hebrew, Samaritan, Greek, and Latin, and in those of all the modern European languages, except the Russian and the two or three others which retain the Cyrillic alphabet; in these the symbol of delta is the fifth letter. The most ancient forms of the symbol D in the languages of Phœnicia, Palestine, etc., are angular with the vertex pointing to the left, for example, ◅, ◁, and the most ancient Greek form was the same angular figure reversed, ▷ (changed afterward to △). In some ancient Greek inscriptions in Hellas itself and in the Greek colonies the angular form of the primitive delta (▷) is rounded to the form D, and this form was adopted by the Latins, who got it from the Greeks who had settled in Campania, now the province of Caserta. The sound of D is produced by pressing the end of the tongue against the upper gums and then forcing the vocalized breath into the mouth. The point of contact of the tip of the tongue with the gums in articulating the sound of D in English pronunciation is a little higher above the insertion of the teeth than when the D of those speaking other languages is sounded, and the same is to be said of the production of the sound of T: the d of continental Europeans is nearer to dh than to the sound of d in English speech. Hence the English sound is alveolar rather than dental. The letter D in very many English words represents an element in the speech of our early language ancestors which became for the Greeks theta (*θ,th*), for the Latins *f*, for the Germans *t*, for example, Eng. *deer*, Gr. θήρ, Lat. *fera*, Ger. *tier*. More curious is the change of the Greek name *Odysseus* to the form *Ulysses* in Latin, and within the Latin language itself the change of *olor* to *odor*, and from *dacrima* to *lacrima*. In many words in English *d* is intercalated or appended for phonetic reasons, for example, Old English *thonor* becomes *thunder*, Old English *soun* becomes *sound*, Norman English *jaunisse* becomes *jaundice;* on the other hand the *d* is dropped out of some words, for example, Old English *woodbind* becomes *woodbine; godsib, gossip; godspel, gospel.*

D is the Latin numerical symbol for five hundred. The ancient Romans represented a thousand by the symbol Ⅽ|Ↄ, and they took one half of that symbol to express half a thousand, five hundred. (It was later written ⅭⅠↃ.) The symbol D with a horizontal stroke over it (D̄) stood for five thousand. In Roman personal names D stood for the prænomen Decimus; thus D. Junius Brutus.

As an initial it is used:

1. In chronology, (1) For *Domini*, genit. sing. of Latin. *Dominus* = Lord, as A. D. = *Anno Domini* = in the year of our Lord. (2) For died.

2. In music, as an abbreviation for *Discantus, Dessus, Destra*, etc.

3. In university degrees, etc., for Doctor, as M.D. = Doctor of Medicine; D.C.L. = Doctor of Civil Law; D.D. = Doctor of Divinity; D.Sc. = Doctor of Science, etc.

4. In English titles, for duke.

D as a symbol is used:

1. In chemistry, didymium.

2. In music.

(1) For the first note of the Phrygian, afterward called the Dorian, mode.

(2) For the second note of the normal scale of C corresponding to the Italian *re*.

(3) For the major scale having two sharps and for the minor scale having one flat in its signature.

(4) For a string tuned to D, for example, the third string of the violin, the second of the viola and violoncello.

(5) For a clef in old mensurable music, D *excellens*.

(6) For *do* in the tonic sol-fa system.

3. In biblical criticism, for the Beza manuscript of the Greek New Testament.

4. In commerce, for English penny or pence, as £ s. d. = pounds, shillings, and pence, being the initial of Latin *denarius*.

Daae, dä'ė, **Ludvig,** Norwegian historian: b. Aremark, near Frederikshald, 7 Dec. 1834; d. Christiania May 1893. He was for 20 years an active member of the Storthing; was several times minister in the various Radical cabinets; and won several gold medals with his historical essays on ancient Norway. He paid particular attention to the annals of his own country; his best-known works being: 'Norwegian Village Legends' (1870–2); 'Norway's Saints' (1879); 'The Migrations of the Norsemen to Holland and England' (1880); and others in this field.

Dab, a popular name given to several species of flatfish (*Pleuronectidæ*), which are found on European sea-coasts. The best known of these is the plaice or fluke. This edible fish is covered with small imbricated scales of brown color mottled with orange spots, and averages about two pounds in weight. In London 3,000,000 of them are consumed annually. The American *Pleuronectes* is the common flounder of the northeastern Atlantic coast, of many species, and an excellent table-fish. The habits of all these flatfish are similar. They live on the shallow bottom, and when danger approaches bury their bodies in the mud, leaving only the eyes exposed.

Dabaiba (also written Dabaybe, d'Abaibe, etc.), a region lying south of the Gulf of Darien, of which the boundaries were never exactly defined. Spanish adventurers in the 16th century learned, as a matter of common report, that they might find there, or at least by exploring in that general direction, a temple lined with gold; and in this half-true story told by the Indians of Darien we probably have the earliest form of the Eldorado myth. Balboa, when governor on the Isthmus, organized a Dabaiba expedition which he led in person (1512). One hundred and sixty men in two brigantines proceeded up the Atrato River, but made little headway against the hostile natives. Governor Pedrarias Davila (June 1515) sent 200 men under Luis Carillo and Balboa on the same errand. Attacked by Indians on the Atrato, one half of the soldiers were killed, and the survivors took nothing but news of shameful defeat back to the coast. It seemed that "the mysterious dominion so mysteriously defended must hold great treasure, and in the inflamed minds of the Christians the savage pantheon of Dabaiba had risen into a lofty edifice glittering with gold and gems, and situated in a region rich and beautiful beyond comparison." (H. H. Bancroft.) Subsequently an expedition of 160 men under Tabira and Birues, with light brigantines and canoes, tempted fate upon the river. The savages on this occasion enjoyed more than their usual measure of supernatural protection, for "the divinity of the golden temple" sent a flood which uprooted trees, overturned one of the vessels, and drowned both leaders. Even Francisco Pizarro, who was of the party, shared the superstitious fears inspired by these events to such a degree that he declined to assume command and continue the quest. Peter Martyr speaks of four attempts to gain the golden temple, one expedition attaining a distance up the river of 80 leagues; but "wonderful mischance! — the unarmed and naked people always overcame the armed and armored." Francisco César, captain of infantry, starting from San Sebastian in 1536, with 80-foot soldiers and 20 horse penetrated a short way into the mountains, returning with treasure valued at 30,000 castellanos. Pedro de Heredia in the same year led 210 mail-clad men into the sierra, but came back empty-handed. César, repeating his experiment, secured treasure amounting to 40,000 ducats. Next, Badillo led 350 men from Cartagena to explore the same region in 1537. The expedition lasted more than a year, and was a complete failure. One half of the soldiers died; Badillo was ruined and disgraced; César, who accompanied him, lost his life. Such luring by occasional gains, such varied and dire misfortunes seemed the work of enchantment; but a realistic explanation is not far to seek. We know that the territory southeast of the Gulf of Urabá or Darien was subject to a cacique named Dabaybe; his name is still given to a village in the department of Antioquia and to a spur of the Western Cordillera in Colombia. This mountain range for years was an insuperable barrier preventing the isthmian Spaniards from extending their domain overland toward the south. Accordingly their eager search was fruitless, though the temple actually was in existence. The Indian stories described, accurately enough, the splendors of the Inca empire, of Curi-cancha, and Cuzco (see those titles). But the adventurers could not realize, and the Indians themselves probably did not know, how far away the famous temple at Cuzco really was. The facts in the case, the accent of truth in the Indians' accounts, sustained the explorers' confidence year after year; but confident search in a region far removed from the object sought is always "mysteriously" baffling. Long before the report of Pizarro's discoveries in Peru reached the isthmus, a fixed belief had taken possession of the minds of the Spaniards that a kingdom more desirable than any they had despoiled, with gold-adorned temples, was somewhere hidden away in the heart of the continent. The attributes of elusiveness and mystery had become an indispensable part of the conception; therefore the true accounts of the wonderful Temple of the Sun did not exactly tally with the "glittering phantom" of their imagination. After Quesada (see COLOMBIA), starting from Santa Marta, succeeded in penetrating, by way of the Magdalena River, the region of Colombian uplands which lay beyond Dabaiba, naturally the golden temple was sought still further inland; and thus the headwaters of the Orinoco and Amazon were discovered. Bancroft and other writers following his prompting have suggested that an ancient building in the Cenú valley, near which were found tombs containing gold and gems, may have been the temple of Dabaiba; it is quite impossible, however, to accept this conjecture, for the reason that colonists of San Sebastian came upon the Cenú building at an early date, and, if it had been the real object of their search, they would have been able, with the assistance of the natives, to identify it beyond question. See ELDORADO.

MARRION WILCOX.

Dabajuro, Venezuela, a township in the district of Buchivacoa, state of Falcón. It includes a village of the same name near which a severe battle occurred 7 June 1822, in the war for the independence of Venezuela; the Royalists under Morales defeating the Republican forces. The patriots lost 167 men in the battle, and afterward some of the prisoners, including several officers, were shot, in violation of the treaty of Trujillo.

Dabb, or **Palm-lizard,** an agamoid lizard (*Uromastix acanthurus*), common in the sandy deserts of northern Africa and Arabia.

Dabchick (*Podilymbus podiceps*), a bird of the family *Podicipedidæ* and the smallest of the grebes, distinguished by the thick bill and absence of cephalic crests. The total length slightly exceeds one foot; the back is brownish black; the belly silvery gray mottled with dusk, but whiter and more silky in winter; the bill bluish in summer, dull yellow in winter. It ranges and breeds throughout tropical and temperate America. *P. fluviatilis* is a closely similar European species. See GREBE.

Dabney, Charles William, American consular officer: b. Alexandria, Va., 19 March 1794; d. Fayal, Azores, 12 March 1871. He was made United States consul in the Azores in 1826, and by his services to the people of the islands made his name a household word among them.

Dabney, Charles William, American college president: b. Hampden-Sydney, Va., 19 June 1855. He is a son of R. L. Dabney (q.v.). He was graduated at Hampden-Sydney College

in 1873, and at the University of Virginia in 1877; and for two years studied in Berlin and Göttingen. He was professor of chemistry in the University of North Carolina, and State chemist, and later director of the North Carolina Agricultural Experiment Station at Raleigh, and an executive officer of the Cotton Centennial Exposition, New Orleans, 1884–5, and of other industrial expositions. He was prominent in establishing the North Carolina College of Agricultural and Mechanical Arts, Raleigh; assistant secretary of agriculture of the United States, 1893–7; president of the University of Tennessee, 1887–1904; and president of the University of Cincinnati after 1904. He has published among other works: 'Washington's Interest in Education' (1899); 'History of Agricultural Education in America' (1899); 'Agriculture and Education' (1899).

Dabney, Julia Parker, American artist and author: b. Fayal, Azores, about 1850. She was educated at Teneriffe, Canary Islands, and in Boston; and has published 'Little Daughter of the Sun' (1896); 'Poor Chola' (1897); 'Songs of Destiny' (1898); 'The Musical Basis of Verse' (1901).

Dabney, Richard Heath, American historical writer: b. Memphis, Tenn., 29 March 1860. He is a son of Virginius Dabney (q.v.). He was graduated at the University of Virginia, afterward studying and taking the doctor's degree at Heidelberg, 1885. He was professor of history in Indiana University, 1886–9; and assistant professor, 1889–96; associate professor, 1896–7, and professor of historical and economical science after 1897 in the University of Virginia. He has published: 'The Causes of the French Revolution' (1888); 'John Randolph: A Character Sketch' (1898); and numerous magazine articles and pamphlets.

Dabney, Robert Lewis, American Presbyterian clergyman: b. Louisa Co., Va., 5 March 1820; d. 1898. He was a professor in Union Theological Seminary, Virginia, 1853–83, and from 1883 was professor of philosophy in the University of Texas. During the Civil War he was a major in the Confederate army and in 1862 was Gen. "Stonewall" Jackson's chief of staff. He published: 'Life of General Thomas J. Jackson' (1864); 'Defense of Virginia and the South' (1868); 'Sacred Rhetoric' (1866); 'Sensualistic Philosophy' (1878); 'Theology, Dogmatic and Polemic' (1879); and 'Collected Discussions' (1891).

Dabney, Virginius, American author: b. Elmington, Va., 15 Feb. 1835. His publication of 'The Story of Don Miff, as Told by his Friend, John Bouche Whacker, a Symphony of Life' (1886), reached its 4th edition in six months. He published: 'Gold that Did not Glitter.

Daboia, dȧ-boi'ȧ, the generic name of a venomous serpent of the East Indies, known also as Russell's viper (q.v.).

Daboll, dā'bŏl, **Nathan,** American educator and writer: b. about 1750; d. Groton, Conn., 9 March 1818. He wrote the 'Schoolmaster's Assistant' (1799) and the 'Practical Navigator.' He is best known for his share in the universally used 'New England Almanac,' which he began in 1773.

Daboll, Nathan, American writer: b. Connecticut 1782; d. 1863. He was son of the preceding, and compiled the 'New England Almanac' begun by his father. He is the author of 'Daboll's New Arithmetic,' long a terror to the American school-boy.

Da Capo, dä kä'pō (It. "from the head or beginning"), in music, an expression written at the end of a movement, to acquaint the performer that he is to return to, and end with, the first strain. It is frequently used in the abbreviated form D. C.

Dacca, dăk'ȧ, or **Dhaka,** dhä'kä, India, a commissioner's division in one of the lower provinces of Bengal. It is one of the richest divisions in India, and although containing a good deal of jungle and unoccupied land, produces such quantities of rice as to be called the granary of Bengal. The surface is an uninterrupted flat, and is intersected by two of the largest rivers in the world — the Ganges and Brahmaputra — from whose periodical inundations its extraordinary fertility arises. Dacca was at one time celebrated for its hand-woven muslins, which are of singular delicacy and beauty. This branch of industry, however, is now carried on to a very small extent. The fineness of the yarn or thread used in the making of these muslins is not equal to that in some fabrics of European manufacture, but in durability and delicacy the Dacca muslins excel other muslins. The finest or "royal muslin" used to be worth about $5 a yard. For the most delicate varieties only yarns are used that are some years old. Pop. 9,844,127.

Dacca, India, city, capital of the district of the same name, and for 80 years, during the 17th century, the capital of Bengal. It is situated on the river called the Boor Gunga (Old Ganges), at the distance of about 150 miles northeast of Calcutta. In this city and vicinity, the celebrated Dacca muslins are still manufactured to a small extent, and jute works have been established in recent years. It has an extensive manufacture of shell bracelets, much worn by the Hindu women. The city was formerly much more extensive than it is at present, and exhibited a degree of splendor to which it has now no pretensions, as the magnificent ruins of bridges, causeways, caravanseries, palaces, gardens, etc., sufficiently prove. Dacca is considered one of the healthiest and most pleasant places in Bengal. In this city is one of the four hospitals for the insane under the Bengal presidency, and a college maintained at the public expense, in which there are about 340 students, mostly Hindus. Pop. (1901) 90,679.

Dace, a name rather loosely applied to various species of small fresh-water fishes of the minnow family (*Cyprinidæ*), but especially to members of the genus *Leu ciscus,* of which 22 North American species are discriminated; others belong to *Rhinichthys, Notropis,* and *Semotilus,* those of the latter being also called chubs and roach. *Semotilus atromaculatus,* the horned dace, is one of the best known and largest species, and abounds in the small brooks of the eastern half of the United States. As in many of the other species, the upper surface of the head of the male is ornamented during the breeding season with cutaneous tubercles. Because of their abundance the dace are im-

portant as furnishing food for larger fishes, and some of the larger species are much sought by juvenile anglers. The European dace (*Leuciscus vulgaris*) is common in British rivers, as well as in those of France, Germany, and Italy. It prefers deep, clear streams and swims in shoals. See CYPRINIDÆ.

Dacelo. See JACKASS KINGFISHER.

Dach, däh, **Simon,** German lyrist: b. Memel 1605; d. 1659. His numerous hymns and songs are found in various collections, his hymns especially in the 'Scriptural Arias' of Heinrich Albert. His 'Annie of Tharau,' a Low-German lay for the wedding of his friend Parson Portatius with Anna Neander, became a popular favorite; his 'Praise of Friendship' seems to belong to a better age; and his spiritual songs, 'In Thy Control, O Lord,' 'Be Comforted, my Soul,' etc., are hardly surpassed by any compositions of his day.

D'Ache', Caran, kä-räṅ däsh. See POIRE, EMMANUEL.

Dachshund, däks'hoont (Ger. *dachs,* badger; *hund,* dog), a breed of small German hounds with very long, cylinder-shaped bodies; short, crooked legs; large heads; long pendant ears; and short, stiff, smooth hair. In color these dogs are black-and-tan, or tan with black ears, the former being the characteristic coloring of the best sort. They were originally used in Germany to hunt badgers, and sometimes even in fox-hunting. Though slow in movement, they are possessed of a keen scent, and great power of endurance, rendering them valuable as hunting-dogs when suitably trained. They are much used by sportsmen on the continent of Europe, but their usefulness is impaired by the difficulty of keeping them under proper command. The dachshund is akin to the old English turnspit, and a similar dog is depicted on the ancient Egyptian monuments.

Dacia, dā'shĭ-ạ, in ancient times, a district of uncertain limits to the north of the Danube, inhabited by the Daci or Getæ, afterward a Roman province. It comprised that region now known as Moldavia, Wallachia, and portions of Transylvania and Hungary. For a long time the Daci were formidable enemies of the Romans, and during the reign of the Emperor Domitian obtained so great an advantage that the emperor was compelled to accede to a disgraceful peace. To wipe off this stain Trajan, the second emperor after Domitian, in the year 100 A.D. invaded the Dacian territory, and forced the Dacian king, Decebalus, to accept humiliating terms of peace. These he soon broke; and Trajan entering Dacia a second time, again subdued it, and then erected it into a Roman province, 106 A.D. The Romans remained masters of this province till the reign of the Emperor Aurelian, when, in 274 A.D., they withdrew from the region to the north of the Danube, and assigned to the Roman colonists of Dacia a territory on the south of the Danube lying between Upper and Lower Mœsia, which was hence called Dacia Aureliani. The former Dacia was now successively overrun by the Goths, Huns, Gepidæ, and Avares. Since that time the history of this country, which then lost the name of Dacia, is to be sought for in that of the provinces of which it formerly consisted.

Dacier, André, än'drā dä-sē-ā, French philologist: b. Castres, Upper Languedoc, 6 April 1651; d. 18 Sept. 1722. He studied at Saumur under Tanneguy Lefèvre, whose daughter Anne was associated in his studies. After the death of Lefèvre, in 1672, he went to Paris, and in 1683 he married the daughter of his former teacher. In 1695 Dacier was elected a member of the Academy of Inscriptions and of the French Academy; of the latter he was afterward perpetual secretary. The care of the cabinet in the Louvre was intrusted to him. Besides editions of 'Pompeius Festus' and the 'Œuvres d'Horace, en Latin et en Français, with the Nouveaux Eclaircissemens sur les Œuvres d'Horace' (1681–9), and 'The Nouvelle Traduction d'Horace' with critical annotations, he prepared translations of 'Marcus Antoninus,' 'Epictetus,' 'Aristotle's Art of Poetry, with Annotations,' etc.

Dacier, Anne Lefèvre, än lė-fāvr, French classical scholar: b. Saumur March 1654; d. Paris 17 Aug. 1720. She was wife of the preceding, and early displayed her learning by an edition of 'Callimachus.' Her learned works were not interrupted by her marriage, which took place in 1683. In her 'Considérations sur les Causes de la Corruption du Goût' she defended Homer with the acuteness of a profound commentator, and Lamotte replied with a great deal of wit and elegance; on which account it was said Lamotte wrote like an ingenious woman, Madame Dacier like a learned man. In her 'Homère Défendu' she showed little mercy to Hardouin, who had written a satirical eulogy of this poet. On this occasion she was said to have uttered more invectives against the reviler of Homer than the poet himself had placed in the mouths of all his heroes. She translated 'Terence' and three pieces of 'Plautus,' in the prologue of which she treats of the origin, the cultivation, and changes of dramatic poetry with acuteness. Her translation of the 'Plutus' and the 'Clouds' of Aristophanes deserves indulgence as the first translation of the Greek comic poet. Her translation of Anacreon and Sappho, with a defense of the latter, met with success. Equally estimable for her character and her talents, she gained as many admirers by her virtue, constancy, and equanimity, as by her works. She was a member of several learned academies.

Dacite, an igneous rock of the diorite family, of porphyritic or compact texture, having crystals of plagioclase felspar quartz and biotite in a glassy or finely crystalline-ground mass. The name is derived from the old province of Dacia, now part of Hungary. Dacites grade into andesites by a lessening of the amount of silica, and differ from rhyolites and trachytes in containing plagioclase rather than orthoclase felspar. A typical dacite shows on analysis the constituent acids and bases in about these proportions: S_2O_2 67.2; Al_2O_3, 17.0; Fe_2O_3, 3.5; FeO 1.2; CaO 4.5; MgO 1.5; Na_2O 3.7; K_2O, 1.6. Dacites are found at Lassen's Peak, Cal.; in the Yellowstone Park; in the Eureka District, Nev., and elsewhere in the western United States. See DIABASE.

Dacoits', bands of robbers in the East, especially in Burma, India, where for years they were the terror of the country until the annexation of Burma by the British in 1886.

Da Costa, dä kŏs'tä, **Izaak,** Dutch poet and theologian: b. Amsterdam 14 Jan. 1798; d. Leyden 28 April 1860. Among his works are: 'Prometheus' (1820); 'Poems' (1821-2); 'Gala Songs' (1828); and 'Hagar' (1840).

Da Costa, Jacob Mendes, American physician: b. St. Thomas, W. I., 7 Feb. 1833; d. Villanova, Pa., 11 Sept. 1900. He was graduated at Jefferson Medical College in 1852, practising in Philadelphia. In 1863 he became lecturer in Jefferson Medical College, in 1872 professor of the theory and practice of medicine there, and in 1891 professor emeritus. In 1895 he was chosen president of the College of Physicians and Surgeons in Philadelphia. He wrote: 'Harvey and His Discovery'; 'Medical Diagnosis,' etc.

Dacrocystitis, dăk-rō-cys-tī'tĭs, an inflammation in the tear-sac. It may result only in the sub-acute swelling of the tear-sac, or it may become purulent, very much inflamed, swollen and painful, and finally discharge pus. Prompt evacuation by surgical means is the safest and best treatment.

Dacryd'ium, a genus of tall trees, mostly Australian, of the natural order *Taxaceæ,* to which also belong the genera *Podocarpus* and *Taxodium,* important timber and ornamental trees. Several species are of wide utility in ship- and house-building and furniture-making, especially for carved furniture; others yield edible fruits (drupes). A kind of beer is made from the young twigs of some species. The most valued species are probably *D. kirkii, D. cupressinum,* and *D. franklinii,* the so-called huon-pine, which is really a yew. They often attain heights of 100 feet and diameters of four feet or more.

Dacryo'ma, a disease of the lachrymal duct of the eye, by which the tears are prevented from passing into the nose, and consequently run over the eyelid.

Dac'tyl, in Greek and Roman versification, a foot consisting of one long followed by two short syllables. In the following line, for example,

Tityre | tu patu | lae recu | bans sub | tegmine | fagi,

the first, second, third, and fifth feet are dactyls. In modern hexameter verse a dactyl is represented by one accented and two unaccented syllables. The word is derived from the Greek *daktylos,* a finger, because a finger has one long and two short joints. See RHYTHM.

Dactyl'iomancy (Greek *daktylios,* a ring, and *manteia,* divination), the pretended art of divining by means of finger rings.

Dac'tylis, or **Orchard-grass,** a monotypic genus of the grass family (*Gramineæ*) native of Europe and Asia. It is naturalized in America, and cultivated as a fodder plant. The flowers are in rounded compressed spikelets at the end of a one-sided panicle. The fruit is loosely enveloped in the glume. The common orchard grass (*D. glomerata*) is often met with in fields and waste places. It is a coarse grass, little relished by cattle in its wild state, but is acceptable in its cultivated state. It grows from New Brunswick south to South Carolina, westward to Kansas, and north to Manitoba. It is sometimes called cocksfoot-grass. See GRASSES.

Dactyli'tis, etymologically, an inflammation of the finger, but generally restricted to an osteomyelitis of the phalanges or metatarsal or metacarpal bones. This may be either tuberculous or syphilitic. In tuberculous form the bone slowly enlarges, the skin becomes reddish, softening takes place, and pus is discharged through a short cavity which leads to dead bone. In its treatment care should be paid to the general condition of the patient. General up-building, by cod-liver oil and other tonics, is necessary. Surgical procedures may be imperative. In the syphilitic form, which usually affects infants, there is as a rule a gummatous deposit in the bones. It resembles the tuberculous forms, but responds to treatment by means of potassium iodide.

Dadayag, dä-dä-yäg', the name of a tribe of the Malayan race, who live in the Cagayan mountains in Luzon. The Dadayags are said to have been cannibals. Their speech differs in some respects from that of any other of the 47 tribes of the Malayans.

Daddy-long-legs, a name sometimes substituted for the more appropriate term "crane-fly," to designate the small British dipterous insect of the family of *Tipulidæ,* some groups of which are harmless, and dance in the twilight air, while others are injurious to growing crops. They are true flies, though having long legs. In America the name daddy-long-legs is applied only to the harvest-spider, of the family *Phalangidæ,* which is not a fly. The body is very small when compared with the great length of the legs, which contain over 50 joints each. The legs are thought to be organs of sense as well as of locomotion. This harvestman lives on small insects and is entirely harmless to man.

Dado, dā'dō, an architectural term for the middle part of a pedestal, that is to say, the solid rectangular part between the plinth and the cornice; also called the die. In the interior of houses it is applied to a skirting of wood several feet high round the lower part of the walls, or an imitation of this in wall-paper, painting, etc.

Dadu'chus (Lat.-Gr., *dadouchos*), literally a torch-bearer, but applied as an epithet to any of the ancient divinities or other personages when they were represented as bearing a torch or flambeau. Daduchi were also those persons who, in the celebration of the Eleusinia at Athens, carried the sacred torches. The daduchus was inferior to the hierophant, and of equal rank with the keryx.

Dædalion, dē-dăl'ĭ-ŏn, the son of Lucifer, changed, according to the Greek legend, by Apollo into a falcon.

Dædalus, dē'dą-lŭs or dĕd'ā-lŭs, mythical Greek sculptor, the scene of most of whose labors is placed in Crete. According to the common accounts Dædalus lived three generations before the Trojan war, was distinguished for his talents in architecture, sculpture, and engraving, and as the inventor of many instruments; for instance, the axe, the saw, the plummet, the auger; also of glue, and masts and yards for ships. As a sculptor he wrought mostly in wood, and was the first who made the eyes of his statues open. He built the famous labyrinth and a temple of Artemus Britomartis in Crete; and executed for Pasiphaë the noto-

rious wooden cow. Being imprisoned with his son Icarus, he invented wings for flying. The wings were fastened on with wax, and Icarus flew so high that the heat of the sun melted the wax, and the wings dropped off, leaving him to fall into the sea, whence the Icarian Sea is said to have received its name. Dædalus himself reached Sicily, on the southern coast of which a place was called, after him, Dædalium. Philologists suppose that Dædalus is not really a proper name, but the common appellation of all the first architects, metallurgists, and sculptors in Grecian antiquity, being derived from or akin to the Greek daidallein, "to work with skill." The mythical Dædalus is sometimes confused with Dædalus of Sicyon.

Dædalus of Sicyon, Greek sculptor who lived about 400 B.C. He is said to have been the pupil, and some authorities say the son of Patrocles. The trophy or stack of armor erected at Olympia, in remembrance of the victory over the Lacedæmonians, was attributed to Dædalus. Other works credited to him are: 'Two Boys using the Strigil'; 'Cowering' or 'Crouching Venus'; and a number of portrait statues of victors in the Olympian games.

Dæmonelix, a scientific name provisionally given to an extraordinary formation, apparently fossiliferous, extending over a large area in northeastern Nebraska and eastern Wyoming. The soft sandstone of this region has undergone excessive erosion, leaving fantastic figures, some of them 40 feet high. The objects to which the term is especially applied are of various shapes, including gigantic pillars, lower cake-like forms, and columns appearing like fingers and cigars. Those particularly exciting scientific inquiry are spiral and twisted, giving rise to the local name "Devil's Corkscrew." These in some cases resemble huge hop-poles with definite vines running up spirally, or screws with exactly cut threads. In other cases the corkscrew is closely imitated, leaving the spiral without the central pole. So far as the tests have gone, the composing material is found to contain cellular, non-vascular, parenchymatous tissue — a fibre distinguishing it from its stony matrix, and not to be referred to animal but rather to plant origin, and pointing to the cryptogam group.

Daendels, Hermann Wilhelm, hĕr'män vĭl'hĕlm dän'dĕls, Dutch general: b. Hattem Gelderland, 1762; d. Africa June 1818. He took part in revolutionary disturbances in Holland in 1787, and was in consequence compelled to seek refuge in France. In the campaign of 1793 he rendered important service to Dumouriez, and was elevated to the rank of a general of brigade. In 1806 he took service under the king of Holland, and from 1808 to 1811 he was governor-general of the Dutch East Indian possessions, and published 'Staat der Nederlandsche Oost-Indische Bezittingen' (1808–11). On the overthrow of Napoleon, the new king of Holland, William I., intrusted Daendels with the organization of the Dutch colonies on the coast of Africa, and there he died.

Dáet, dä'ät, Philippines. 1. City of Luzon, in the province of Ambos Camarines, situated between the Dáet River and one of its branches. It is a radiating point of several roads, a port of entry. It was the capital of the Spanish province of Camarines Norte. Pop. 10,650. 2. A river which enters the sea near the town of the same name.

Daffodil (corrupted from the Latin *asphodelus*), the English name of those species of *Narcissus* which have a large bell-shaped corona. The common daffodil (*N. pseudo-narcissus*) is a native of England and of nearly all parts of Europe, growing in woods and hedges, and often cultivated in gardens, where it not unfrequently becomes double. In gardens many varieties of it are among the most esteemed of early flowers.

Dagami, dä-gä'mē, Philippines, town in the province of Leyte, on the Binahaan River, 16 miles south-southwest of Tacloban. Pop. 25,000.

Däge, Eduard, ĕd'ooärd dä'gė, German historical painter: b. Berlin 10 April 1805; d. there 6 June 1883. He was a pupil of Neiderlich and Wach, finishing his studies in Italy. Besides his religious paintings Däge was remarkable for his genre pictures of small size. His chief works are found in the churches of Rostock and Sigmaringen, and in the chapel of the Château at Berlin. His 'The Old Sacristan' and the 'Discovery of Painting' hang in the National Gallery at Berlin. Among his other works are many altar pieces for churches: 'The Parcæ' and 'Woman and Child,' in the Raczynski Gallery in Berlin; 'Initiation of a Nun'; 'Shelter at the Altar'; 'Charitable Monk'; 'Roman Woman and Child.'

Dagger, a weapon resembling a short sword, with a two-edged, sometimes three-cornered, sharp-pointed blade. In the feudal period it was carried by knights in addition to their sword; and in single combat it was wielded in the left hand, and used by them to parry the blows of their adversaries, and also to despatch a vanquished opponent, unless he begged for quarter, whence it was called the "dagger of mercy." A kind of dagger known as a dirk was formerly used by the Scottish Highlanders, and is still regarded as an essential part of a Highland costume. The dagger has been regarded as especially the weapon of assassins. In printing, a dagger (†) is often used for the second reference on a page when there is more than one.

Dagger-moth, a common name given to both *Acronycta* and *Apatala,* genera of nocturnal moths, which feed upon the leaves of orchard trees and small fruits. *Acronycta* has fore wings varied with dagger-like black marks. *Apatala* has gray fore wings margined with black dots and transverse lines. The caterpillar is of a velvety black color, and is beautiful. It changes into the pupa by wrapping itself in leaves bound with a silken thread.

Daggett, Mary Stewart, American writer: b. Morristown, Ohio, 30 May 1856; married Charles Daggett in 1875. She has published: 'Mariposilla' (1895); 'The Broad Isle' (1899).

Dagh, a Persian word signifying mountain; hence Daghestan, land of mountains.

Daghestan, dä-gĕs-tän', Russia, province in the Caucasus, stretching along the west side of the Caspian Sea; area, 11,036 square miles. Its fertile and cultivated valleys produce good crops of grain, silk, cotton, flax, and tobacco.

The inhabitants are chiefly Mohammedans, of Tartar and Circassian origin. Capital is Derbend. Pop. 601,987.

Dagnan-Bouveret, Pascal Adolphe Jean, päs-kal ä-dōlf zhŏn dän-yän boov-rā, French painter: b. Paris 7 Jan. 1852. He was a pupil of Gérome, and recipient in 1874 of the second "Grand Prize of Rome." He soon broke with the style of Gérome and showed the influence of Bastien Lepage. His picture of the death of Manon Lescaut, which took the medal of the third class at the Salon of 1878, showed him to be in possession of an original and particularly individual style of painting. 'A Wedding Party at the Photographer's,' exhibited in the Salon of 1879, was much admired for composition and technique. But this style was too close to caricature and was soon abandoned. In the Salon of 1880 he displayed a much more serious form of talent. His picture 'An Accident,' which took the medal of the first class that year, remains one of his masterpieces, being greatly admired for the truth of its types and expressions. These early works ranked him among the most keen portrayers of our modern manners. 'The Blessing of a Young Couple before Marriage' (1882) bore the stamp of extraordinary poetical feeling which his later paintings, illustrating, for the most part, the life, customs, and costumes of Bretagne, served to accentuate. In his 'Hamlet and the Grave Diggers' the artist is himself represented as the moody Danish prince. Among his best-known works are: 'The Consecrated Bread,' in the Luxembourg; 'The Virgin'; 'The Bretons at the Pardon' (1887); 'The Breton Peasant' (1888); 'The Cemetery of Side Kebir'; 'The Conscripts'; 'The Lord's Supper' (1896), a very great work; 'The Horses at the Watering Trough' and two portraits of de la Rochetaille and Gustave Courtois. Very modern in his taste for individuality, he resembles the great masters in the touching simplicity of his feeling, and the idealism which is evolved from his strong realism and illumines it. See Stranahan, 'History of French Painting' (1899); Van Dyke, 'Modern French Painters' (1896)

Dago, dăg'ē, or **Dagden,** Russia, an island included in the government of Esthonia. It is situated to the southwest of the entrance of the Gulf of Finland, and has productive fisheries. The soil is mostly poor, and the coast rocky. The inhabitants include many Swedes. Pop. about 16,000.

Dag'oba, in Buddhist countries and those which at one time held the Buddhist faith, a massive erection containing relics. The word is said to be derived from *dá, dátu,* or *dhátu,* a relic, and *geba* or *garbha,* the womb. They are built of brick or stone, are circular in form, and are erected on natural or artificial mounds, while the stone or brick structure itself sometimes rises to an immense height. The contents of a dagoba usually consist of stone or metallic vessels of various shapes and sizes. One of the articles is usually a silver casket, with a gold casket, often highly wrought with chased work on the surface and set with precious stones, and this second casket is either enclosed in the first or lying beside it with the rest of the objects. Some of the smaller articles, such as pearls, gold, buttons, rings, beads, etc., are sometimes contained in these caskets, which are in some cases scratched on the surface with a peculiar character. These dagobas have always been held in the highest veneration by the Buddhists, and a common mode of testifying their veneration is to walk around them, repeating prayers the while. Some remarkable dagobas are to be seen at Anuradhpura, in Ceylon.

Dagobert (dăg'ō-bėrt or dä-gō-bār) **I.,** king of the Franks: b. about 600; d. Epinay 638. In 628 he succeeded his father, Clothaire II., who had acquired the divided members of the Frankish empire. He waged war with success against the Slavonians, Gascons, and Bretons; but stained the splendor of his victories by cruelty, violence, and licentiousness. After he had conquered the Saxons, it is said that he caused all those whose stature exceeded the length of his sword to be put to death. He deserves praise for his improvement of the laws of the Franks. He was buried in St. Denis, which he had founded.

Dagon, a deity of the Philistines, whose image is generally believed to have been in the form of a triton or merman, with the upper part human and the extremities, from the waist downward, in the shape of the tail of a fish. From this latter circumstance the name is derived, from the Hebrew *dag,* a fish. Dagon and his temple are mentioned in Scripture, more especially in 1 Sam. v. 4. Milton alludes to him in describing the infernal senate in 'Paradise Lost.'

Daguerre, Louis Jacques Mandé, loo-ē zhäk män-dā dä-gār, French inventor: b. Cormeilles, Seine-et-Oise, 18 Nov. 1789; d. Petit-Brie, near Paris, 10 July 1851. He was at first a scene-painter at Paris, and while engaged in painting panoramic views, he discovered a method of representing moonlight, day and night, changes of season, and so on, by the proper illumination of a large transparent canvas painted on both sides. (See Diorama.) The pictures were first exhibited in Paris in 1822. On 19 Aug. 1839 his successful completion of photographic printing was announced to the Academy by Arago. As early as 1814 Nicéphore Niépce had directed his attention to photography, and in 1827 had delivered pictures on metal to the Royal Society. In 1826 he had been joined by Daguerre, and on 14 Dec. 1829 a formal agreement was made between them. Niépce died 5 July 1833, and had apparently before his death given up the hope of succeeding with a plate sensitized by iodine. Daguerre, however, persevered, and at length produced the method which has been since called daguerreotype. See Daguerreotype Process.

Daguerreotype (da-ger'-ō-tīp) **Process,** one of the earliest methods known for fixing the image afforded by the camera, and thus producing permanent pictures, or "photographs." As practised by Daguerre, the method consists in exposing a silver plate to the action of iodine vapor until a sufficient coating of iodide of silver is produced upon it, and then allowing the image in the camera to fall upon it for a time varying from three minutes to an hour or more, according to the nature of the subject and the intensity of the light. The plate is then submitted to the action of the vapor of mercury, which condenses most upon the parts where the light has acted most, and in this way greatly increases the distinctness

of the image. The plate, after development by mercury vapor in this way, is immersed in a solution of hyposulphite of soda, which dissolves those parts of the iodide that have not been affected by light, and thus renders the picture permanent. Daguerre made the details of his process public in 1839, and for this he was awarded a pension by the French government. Important improvements in the method were soon made. The iodide of silver is so feebly sensitive to light that Daguerre, in his public demonstration of 17 Sept. 1839 gave his picture an exposure of 1 hour and 12 minutes. In December 1839, before the first French photograph by the iodine process had been received in the United States, Dr. Paul Beck Goddard of Philadelphia discovered that iodine could be advantageously replaced by bromine, an element discovered by Balard 13 years before. By the use of bromine, the sensitiveness of the plate was increased so greatly that Dr. Goddard obtained some practically instantaneous views. The earlier method had been tried for portraiture, but, owing to the great exposures required, the results were described by a newspaper of the time (and no doubt with reason) as "most terrific facsimiles of the human visage." Upon the substitution of bromine for iodine, or the use of bromine in conjunction with iodine, the exposures were reduced to more reasonable lengths, and the pictures that were obtained were much less "terrific." Early in 1840 Robert Cornelius, of Philadelphia, fitted up a room exclusively for portraiture, and this was the first photographic studio in the world. The expensive silver plates were afterward replaced by plates of copper that had been heavily electroplated with silver, and a method of toning the pictures by the use of chloride of gold was also devised. Daguerre was associated, in his experimental work, with Nicéphore Niépce, who had previously discovered the bitumen process (q.v.) of taking photographs; and many authorities maintain that Daguerre took unfair advantage of his partner, and published, as his own, processes for which Niépce should have had equal credit. However this may be, it is certain that Niépce died in 1833, some years before Daguerre produced any pictures by the method that now bears his name; and it would appear that Daguerre is at least entitled to the sole credit for the discovery of mercury as a developing agent. The way in which this discovery came about is of deep interest, and as the legend was cited by Professor Liebig as one of the finest examples of the inductive method of reasoning, it may perhaps be received with some degree of confidence in its authenticity. Daguerre had discovered that iodide of silver is affected by light, and he had repeatedly iodized silver plates and exposed them in his camera, with the result that feeble images were obtained. He was filled with hope that some way might be found to intensify these images, but he worked for years without success, and Niépce died with a feeling of regret that they had wasted so much time upon a method that was apparently incapable of yielding the results that they sought. On one occasion, after the death of Niépce, Daguerre removed one of his old plates from a closet in which it had been stored, and was about to repolish it and use it over again in a new experiment, when he observed that the view to which it had been previously exposed, and which showed but faintly when he had put the plate away, was now strong and clear. Without disturbing anything in the closet, he prepared a new plate, sensitized and exposed it as before, and placed it in the closet for a similar time. The same intensification of the image was observed. He concluded that the developing agent that he had sought so indefatigably was present in his closet, but he had no idea what it could be. To identify it, he prepared and exposed plate after plate, each time leaving the plate where the first one had stood, but each time removing one article from the closet. The pictures still developed, even when the last thing had been apparently removed. He found, however, that some mercury had been spilled in the closet, and being driven to the conclusion that this was the mysterious agent sought, he tried it, and his mercury-development process was the result.

Dagun, a god worshipped in Pegu. According to Indian mythology, when Kiakiak destroyed the world, Dagun reconstructed it.

Dagupan, dä-goo-pän′, Philippines, a town in the province of Pangasinan, Luzon, situated on the Lingayen River where it enters the gulf of the same name, about 130 miles northwest of Manila, on the Manila & Dagupan Railroad. It is an important road centre, and has a large trade. It was one of the strongholds of the Filipino insurgents and the point where most of the filibustering expeditions landed. Soon after hostilities between the United States and the insurgents opened, the American military authorities were unanimous in the opinion that Dagupan should be made a base of operations, but sufficient troops were lacking till November 1899, when an expedition left Manila for this place under command of Gen. Wheaton. A landing from the transports, supported by a number of naval vessels, was made at Lingayen, a suburb of Dagupan, which has a sheltered harbor and had hastily constructed earthworks. The works and town were shelled, but there was no response from shore. As the American troops were being landed in steam launches a long line of insurgents suddenly appeared among the sand dunes and fired upon the troops. The Americans returned the fire, completed their landing, and drove the insurgents out of Dagupan, and then started on a march to the east and south in the expectation of surrounding Aguinaldo at Tarlac, where he had established his headquarters.

Dahabieh, dä-hä-bē′ė, a barge-like boat used on the Nile for conveyance of travelers. It varies considerably in size, has one or two masts, with a very long slanting yard on each mast supporting a triangular or lateen sail, and accommodates from two to eight passengers. Wealthy travelers often hire one of these vessels for a trip up and down the river, the voyage to the First Cataract and back, under the most favorable circumstances, occupying seven weeks, and three weeks more if prolonged to the Second Cataract.

Dahl, Johann Kristen Clausen, yō′hän krĭs′tĕn klow′sĕn däl, Norwegian landscape painter: b. Bergen, Norway, 24 Feb. 1778; d. Dresden, 14 Oct. 1857. His talent displayed itself early and he studied at the Academy of Copenhagen 1811–18. He then went to Dresden, where from 1821 onward, he was professor of

painting in the Art Academy. Among his works are: 'Storm at Sea' (1823); 'Winter Landscape.' He was a prolific painter and his works are found in many European galleries. See Aubert, 'Maleren Professor Dahl' (1892–4).

Dahl, Konrad Neuman Hjelm, kōn'räd noi'mān hyĕlm, Norwegian poet and novelist: b. Drontheim 24 June 1843. He is author of a series of stories and novels of Norwegian and Lapp life, with much insight into nature and into the heart of the people. Most notable among them are: 'The Finnish Youth' (1873); 'The Lion' (1874); 'Eda Mansika' (1875); 'The Voyager in the Icy Sea' (1878).

Dahl, Michael, Swedish painter: b. Stockholm, Sweden, 1658; d. London, England, 20 Oct. 1743. He was taught painting by Ernstraen Blocker; later studied in France and Italy; and settled in London in 1688, where he had a very successful career. During the reign of Queen Anne and George I. he acquired an extensive patronage among the nobility and at court. His coloring is good and the accessories are rendered honestly, though in rather a tasteless style. He did not display either originality or genius, but was content to portray his patrons as he found them.

Dahlak, dä-läk', a group of three islands, with many smaller rocks, in the Red Sea, off the Bay of Massowah. They were famous in Roman times for their pearl-fisheries, but the beds have long since been exhausted and abandoned. The inhabitants number about 1,500, and are under the rule of a sheik holding authority from Egypt. They carry on a trade with the Arabian coast.

Dahlgren, däl'grĕn, **Fredrik August,** Swedish poet and dramatist: b. Nordmark 20 Aug. 1816; d. 1895. He wrote many dialect songs and ballads, collections of which were published in three volumes (1876). These have attained an extraordinary degree of popularity. Of his dramas many have been very successful; his 'Vermlandingarne,' a musical drama (1846), had more than 100 consecutive representations. He translated a great many dramas from foreign languages, and wrote a history of the Swedish stage.

Dahlgren, däl'grĕn, **John Adolf,** American naval commander: b. Philadelphia, Pa., 13 Nov. 1809; d. Washington, D. C., 1870. In 1826 he entered the navy of the United States as a midshipman, in 1837 was advanced to the rank of lieutenant, and in 1855 to that of commander. From the year 1847 he was employed on ordnance duty, and invented the cannons which are called after him Dahlgren guns, besides contriving a more effective method of arming gunboats with 12 to 24 pounder howitzers, throwing canister-shot and shrapnel-shells. At the outbreak of the Civil War he was commander of the naval station at Washington; in July 1862 he undertook the supreme command of the South Atlantic squadron; and after the death of Admiral Foote in 1863 was appointed to the command of the fleet stationed before Charleston. He is the author of 'Thirty-Two Pound Practice for Ranges' (1850); 'Systems of Boat Armament in the United States Navy' (1852); 'Naval Percussion Locks and Primers' (1852); 'Ordnance Memoranda' (1853); and 'Shells and Shell-guns' (1856). Consult 'Memoir of John A. Dahlgren' (1882).

Dahlgren, däl'grĕn, **Karl Fredrik,** Swedish poet and humorist: b. Stens-Bruk, East Gothland, 20 June 1791; d. Stockholm 2 May 1844. He excelled in descriptions of nature and in the idyllic burlesque. Many of his songs and ballads have a permanent place in the treasury of Swedish popular songs. For years he published a 'Muses' Almanac,' containing his stories and comic sketches. His novel 'Nahum Fredrik Bergström's Chronicle' (1831) is a work of distinguished merit.

Dahlgren, Madeleine Vinton, American author: wife of Rear-Admiral Dahlgren; b. Gallipolis, Ohio, about 1835; d. Washington, D. C., 28 May 1898. She was married in 1865 to J. A. Dahlgren (q.v.). Her works include: 'Idealities' (1859); 'South Sea Sketches' (1881); 'Etiquette of Social Life in Washington' (1881); 'Memoirs of John A. Dahlgren' (1882); 'The Lost Name'; and 'Lights and Shadows of a Life' (1886). For her Spanish translation of Donoso Cortes' 'Catholicism, Liberalism, and Socialism,' she received the thanks of Pius IX.

Dahlgren, Ulric, American military and naval officer: b. Bucks County, Pa., 1842; d. 4 March 1864. He was a son of Rear-Admiral J. A. Dahlgren (q.v.). At the outbreak of the Civil War he became aide, first to his father and later to Gen. Sigel, and was Sigel's chief of artillery at the second battle of Bull Run. He distinguished himself in an attack on Fredericksburg and at the battle of Chancellorsville, and on the retreat of the Confederates from Gettysburg he led the charge into Hagerstown. He lost his life in a raid undertaken for the purpose of releasing national prisoners at Libby prison and Belle Isle.

Dahlgren Gun (named from Rear-Admiral John A. Dahlgren), a gun in which the front portion is materially lightened and the metal transferred to the rear, giving the "bottle-shape," which caused some surprise on its first appearance in Europe. Col. Bomford, chief of ordnance of the United States army, began making this experiment previous to the War of 1812, and gave the name of "Columbiad" to the piece.

Dahlia, dä'lĭ-ą, a genus of perennial herbs of the natural order *Compositæ,* closely related to the genera *Bidens, Coreopsis,* and *Cosmos* (q.v.), which are distinguished by technical characters. Indeed, *Cosmos diversifolius,* or black cosmos, is well known to American gardeners as *Bidens* and *Dahlia.* The true dahlias are much confused as to nomenclature, only about 10 well-authenticated species being recognized out of a large number of synonyms. With few exceptions (Central American species) they are natives of Mexico. Six species are cultivated, but only one of these (*D. variabilis*) and its apparent sub-species, *D. juarezii,* are of wide horticultural importance. The former has given rise to several thousand horticultural varieties since 1814, when well-marked double varieties first appeared; the latter, which was introduced about 1879, has produced a considerable number popularly known as cactus dahlias. There are also many single varieties. Considering the short time the dahlias have been in cultivation (since 1879) they have attained a very high rank as a garden plant, being numbered among a dozen plants to have special societies and

exhibitions, both in Europe and America. Besides the cactus forms, which are less formal than the earlier double varieties, there are many forms and sizes ranging in color from white to yellow and deep red, but deficient in the shades of blue.

The plants may be propagated by seeds for obtaining new varieties, by division of the underground parts, or commercially, by cuttings. They succeed well in almost any good soil, the tubers or the young plants being set in beds as soon as danger from frost is past. When frost has killed the tops in the autumn the plants are dug and the tubers stored in a cool, dry cellar until spring, or until they are needed for obtaining cuttings, when they are placed on greenhouse benches and forced. Few pests attack the plants.

Consult: Bull. No. 47, Missouri Experiment Station; Peacock, 'The Dahlia,' and other literature mentioned in article 'Dahlia' by Bailey in 'Cyclopedia of American Horticulture' (New York 1900–2).

Dahlin, dä'lĭn, a white substance, also called inulin, obtained from the pounded tubers of the dahlia. The juice is pressed from the tubers, clarified by standing, mixed with an equal bulk of strong alcohol, filtered, and then with two other volumes of alcohol. Inulin precipitates, and is washed and dried. It is a white starchy powder, with distinct crystalline character; it has no taste or smell, is hygroscopic, but sparingly soluble in water, until it passes into a non-crystalline modification. The tubers pounded and distilled with water yield a strongly smelling, sweetish ethereal oil, which is heavier than water, but becomes buttery and semi-crystalline in it. The tubers also contain a fixed oil and salts of organic acids. The coloring matter of the purple dahlia is very sensitive to acids, which turn it red, and to alkalies, which turn it green. When extracted by water or alcohol, and paper steeped in it, it forms Georgina paper, and is used as a chemical test instead of red and blue litmus paper.

Dahlmann, Friedrich Christoph, frēd'rĭH krĭs'tōf däl'män, German historian: b. Wismar 13 May 1785; d. Bonn, Prussia, 5 Dec. 1860. He studied at Copenhagen and Halle; in 1812 was appointed professor extraordinary of history at Kiel, and in 1829 accepted a call to fill the chair of political science in the university of Göttingen. There he continued his historical studies, but did not on that account altogether abandon the domain of politics. He contributed in great measure to the establishment of the constitution of Hanover in 1833, and was a vigorous advocate of liberal principles. In 1842 he was appointed to the chair of history in the university of Bonn, where he gave himself up entirely to literary pursuits. The revolution of 1848 recalled him to public life. He was sent as a deputy to the diet of the confederation, had a share in elaborating the constitution called that of the "Seventeen," and became one of the chiefs of the constitutional or parliamentary party. He was afterward a member of the Prussian chamber of deputies, in which he set himself to withstand the reactionary movement which followed the troubled period of 1848–9; but finally renounced politics entirely, and devoted the remainder of his life to literature. He left a large number of works, all characterized by great depth, an accurate understanding of the events he relates, and a thorough knowledge of men. Among these are his 'Quellenkunde der deutschen Geschichte' (1830); 'Geschichte Dänemarks' (1840–3); 'Geschichte der englischen Revolution' (1844); and 'Geschichte der französischen Revolution' (1845). See Springer, 'F. C. Dahlmann' (1870–2).

Dahlonega, dä-lōn'ę-gą, Ga., county-seat of Lumpkin County, about 20 miles north by west of Gainesville, on one of the branches of the Chattahoochee River, among the foothills south of the Blue Ridge Mountains. It is the seat of the Georgia Agricultural College. The town is the centre of the richest gold mining region east of the Mississippi River. The town was first settled in 1831 by gold miners. The principal industries are those connected with the mining and refining of gold. Pop. (1900) 1,255.

Dahn, dän, **Julius Sophus Felix,** German historian: b. Hamburg 9 Feb. 1834. He was professor of jurisprudence successively in the universities of Munich, Würzburg, Königsberg, and Breslau. Among his historical works are 'The Kings of the Germans' (1861–71); 'Geschichte der deutschen Urzeit' (1883–8). He is the author of many tractates on the jurisprudence of the ancient Germans, and the civil and criminal law and procedure of modern German states. He has also written epics and lyrics. Of the former may be named 'Herald and Theano' (1856); of the lyrics, 'Ballads and Songs' (1878). He is author also of the dramas: 'König Roderich'; 'Sühne'; etc., as well as several romances.

Dahomey, dä-hō'mĭ or -mā (native name of the people, *Dauma* or *Dahomé*), a French protectorate in western Africa, bounded on the east by the British possessions of Nigeria and Lagos, on the south by the Gulf of Guinea, on the west by Togoland (German), and on the north by the French military possessions; area about 60,000 square miles, having been increased in 1900 by territory in the north, adjacent to the Niger. The coast line is only about 70 miles in length. About midway on the coast lagoon is the port of Whydah, whence a road extends inland to Abomey, a distance of 65 miles. Dense forests and dismal swamps cover nearly two thirds of this distance, but from the Great Swamp of Agrimé vast undulating plains rise for many miles in the direction of the Kong Mountains. The Avon and Denham lagoons receive the rivers, which are not very important. The soil is extremely fertile. Among native trees are the baobab and the cocoanut palm. Groves of oil-palms encircle each town, and palm-oil is made in large quantities. Maize, beans, and peas, as well as cassava, yams, sweet potatoes, limes, oranges, pineapples, and other tropical fruits grow in luxuriance; cotton, sugar, and spices of all kinds are also grown, and sheep, goats, swine, and poultry are raised, though not in large numbers.

In 1901 the imports, which consisted chiefly of liquors, tobacco, and cotton goods, were valued at $3,150,130; and the exports, which were chiefly palm-oil and palm kernels, $2,095,763. Some cotton cloth is made in the country, and weapons and tools are forged from native iron. There are few roads in the country.

In 1902 a railway was constructed from the port of Kotonu into the interior. A telegraph line connects that port with Abomey, the Niger and the Senegal. There were 950 miles of telegraph and 100 of telephone line in 1903. The currency consists of cowrie shells and French, English, and American coins. The colony is administered by a lieutenant-governor with an administrative council.

Daibutsu, dī-boo'tsoo, the name given in Japan to a gigantic statue of Buddha. The largest Daibutsu in the empire is found at Nara (q.v.). It is 53 feet high and supposed to date from the 8th century. The image is shrined in a pagoda. At Kamakura (q.v.) is a bronze Daibutsu over 49½ feet in height. The eyes, which are four feet long, are made of gold.

Daillé, Jean, zhŏn dä-yā, French Protestant theologian: b. Châtelherault 6 Jan. 1594; d. Charenton, near Paris, 15 April 1670. He became pastor in 1625 of the church at Saumur, and in 1626 of that of Charenton at Paris, where he passed the remainder of his life. He was one of the ablest and most learned divines of his day, and did essential service to the Protestant cause by several works, among which the most celebrated is entitled 'Traité de l'emploi des SS. Pères pour le Jugement des Différends de la Religion' (1632). It was also published in Latin and translated into English, and in both forms has had a very extensive circulation both in England and on the continent. It aims to show that the authority of the fathers has been far too much overvalued, and that the ignorance or inaccuracy apparent in almost all their works unfit them for the establishment of any doctrine not clearly laid down in Scripture. He also wrote distinct treatises on several of the leading points of controversy between Protestants and Roman Catholics.

Daimiel, dī-mē-ĕl', Spain, town in the province of Ciudad Real; about 20 miles east-northeast of the town of Ciudad Real on the Azuer River. It is well built; the principal edifices are two parish churches, the one Gothic, the other Doric, and both surmounted by towers. The manufactures consist chiefly of linen and woolen fabrics, and lace, and the trade is chiefly in grain, cattle, wine, and wool. Pop. 11,850.

Daimios, dī'mē-ōz, a class of feudal lords formerly existing in Japan, but now deprived of their privileges and jurisdiction. As long as their feudal possessions remained to them, they exercised in their own domains the rights of petty rulers, and 18 of them were to all intents and purposes independent; a circumstance which greatly limited the power of the mikado, and formed a hindrance to the career of progress and reform on which Japan had entered. In order to centralize the power of the government, a decree was issued on 12 Aug. 1871 by which the daimios were deprived of all rights of sovereignty, their districts incorporated with the imperial territories, and their troops handed over to the imperial government. At the same time a new constitution and organization were given to the state. A deliberative assembly, consisting of two chambers, was created, to which deputies were sent by the former feudal governments or districts of the daimios (Han); and the daimios themselves were made official governors of those districts which they previously held as feudal rulers, and were placed upon a salary hereditary in their families. Their salaries now equal one tenth of their former income.

Daiquiri (dăē-ke-ree'), a town lying about 15½ miles southeast of Santiago, on the southern coast of Cuba. The American army of invasion, excepting Kent's division, made (22 June 1898) a successful landing at this place. See UNITED STATES: **The War With Spain.**

Dair-el-Kamar, dīr-ĕl-kā'mär, Syria, the chief town of the Druses, on a slope of Mount Lebanon, 12 miles southeast of Beirut. It is accessible only by two narrow paths. The only remarkable buildings are a large khan, a palace which formed the old serai of the emir of Lebanon, a Maronite convent, and several churches. Pop. 8,000.

Daircell, Saint, said to have lived in Kerry, Ireland, in the 7th century. The legend is that he was the illegitimate son of a husbandman, and that the mother sought to kill the child at birth. A fluttering white dove, which seemed to descend from heaven, stayed her hand, and saved the life of the babe.

Dairy Cattle, the name given to the neat cattle raised for their milk, rather than for their flesh, the latter being called beef cattle. Man has, by careful attention, prolonged the natural period of milk-flow and increased the quantity much beyond the needs of the calf. This is drawn from the cow by the milking process familiar to most people; and the value of the cattle depends upon the quantity and richness of the milk produced, more than upon any other feature. Naturally, however, the more robust breeds, and those that can do well on comparatively coarse food, are most useful in certain sections of country subject to extremes of temperature, and producing inferior fodder-grass.

Though dairy cattle are bred almost all over the civilized world, the stock of the best breeds comes from the British Isles, Holland, and Switzerland, the two last named countries being justly famous for their rich milk and fine cheese.

In America, almost all breeds of cattle are represented, and experiments have been made and statistics gathered under the supervision of government, as to the breeds that thrive best in the various agricultural districts. According to the reports of the United States Department of Agriculture these are the Brown Swiss, which, as its name signifies, is of Swiss origin; the Dutch Belted, and Holsteins, two breeds from Holland; and the Ayrshire, Devon, Guernsey, Jersey, and various breeds of Durham from Great Britain.

Dairy cattle are usually somewhat less heavy than beef cattle; and, except in rare cases, are extremely gentle. They should be well cared for, and kept in as cleanly a manner as possible, as such care is fully repaid by both the amount and condition of the milk produced.

The Brown Swiss is a breed of medium size, fleshy, well-proportioned, with a straight, broad back, heavy legs and neck, and a somewhat coarse appearance. Despite this, however, these cattle are rather small-boned, have fine silky coats, and rich elastic skin. The color is brown, shading into a soft mouse color, or dun, on the body, with head, neck, and legs very dark, often almost black. The nose, tongue, hoofs, and switch are quite black. There is a light-colored stripe around lips and nostrils, a tuft of light

hair between the horns, and a similarly colored stripe along the tail. The eyes are full, gentle, very bright, and usually black. The small horns are white, tipped with black, and curve forward and inward. The ears are good-sized, and round, and lined with light-colored, silky hair. The udder is large, and quite white. The average weight is from 1,200 to 1,400 pounds, the bulls sometimes attaining greater size and weight. Both bulls and cows are hardy and active, and, owing to their origin, thrive well in mountainous regions. The bulls are just as docile as the cows, and even in big herds, are easily managed.

The Dutch Belted are gentle, vigorous cattle, with rather longer legs and less bulky bodies than other breeds, and are easily known by the broad belt of white encircling the body, between hips and shoulder blades, forming a marked contrast to the jet-black, glossy coat of the remainder of the body. No white should appear on the black portion, and on the white belt there should be no black spot.

The second Dutch breed, the Holstein-Friesian, is characterized by great size, and by the black-and-white coat. The ground-color is usually jet-black, of a silken texture, with marks of pure white upon it. These do not merge gradually into the black, but are clearly outlined patches. The horns are small, usually white, tipped with black. The tail is tipped with a white brush. Though the largest and heaviest of dairy cattle, the Holsteins are not so easily satisfied with coarse food, nor so hardy as many other breeds; and they are large feeders.

The British breeds are varied. The Ayrshire is the breed best suited to rugged uplands, pastures, and inclement weather. These cattle, generally under the average in weight, are short-legged, small-boned, and alert. The horns are gracefully curved, generally upward; the eyes are unusually bright. The color is red and white in spots; the red sometimes varying to a rich brown. The coat is always glossy; and the intelligence, economy, and large yield of milk make this a favorite breed.

The Devon, considered the most beautiful of dairy breeds, is a red-coated, smooth-skinned animal, active, hardy, symmetrical, and intelligent. Though the typical red may vary in tone, being sometimes pale, sometimes dark, no markings of white or black appear, save one patch of white on and in front of the udder. The females have beautiful, creamy, black-tipped, pointed horns, curving upward. The males have shorter, thicker, and less graceful horns.

Guernseys, as their name signifies, originated in the island of Guernsey in the English Channel. They are yellowish in color, often with patches of white on the body and legs. The ground color is deepened almost to brown in many cases. The horns are small, fine, and graceful, often yellowish from the base. This breed secretes a large amount of yellow coloring-matter, noticeable in the animals themselves, and very prominent in the golden color of the butter made from their milk. Guernseys are nervous, and yet with care may be kept quite gentle.

The Jerseys, from the same group of islands as the former breed, are smaller than any other breed of dairy cattle. In color these animals are rather variable, ranging through shades of brown to black, yellow, tan, or cream, either solid color, or broken, patches often being white. The horns are small and crumpled, the eyes soft and gentle. Jerseys are much less fleshy than most other breeds, and are sharper in outline. They are light, quick, and rather graceful in motion; and are second only to Guernseys in the richness and color of their milk. There is an unmistakable, though indefinable, air of breeding about a Jersey that invariably shows.

The Durham cattle are of various breeds. They are all short-horned or quite hornless; are red in color, sometimes marked with white; have heavy bodies, and short, broad heads. They are usually classed as beef cattle; but are so capable of giving good milk in large quantities that they are often bred for dairy purposes. They are exceedingly docile, even the great bulls, which attain a weight of 2,500 to 3,000 pounds, being thoroughly domesticated.

Dairy Industry, American. Compared with other farming and agricultural industries in the United States, dairying is one of considerable import and shows great development during the last two or three decades. The industry is most prominent in sections where natural advantages are the greatest. According to government statistics, the leading dairy States are Vermont, Connecticut, Massachusetts, New York, New Jersey, Pennsylvania, Ohio, Michigan, Indiana, Illinois, Wisconsin, Iowa, and Minnesota. Butter is made in all these States, while New York, Wisconsin, and Ohio are the heaviest producers of cheese, the varieties including imitations of many foreign cheeses. Dairy farms are rapidly developing in sections where wheat and other "general" crops have become unprofitable. The industry has recently made great advances in North and South Dakota, Nebraska, Kansas, Missouri, and the Pacific Coast States, also in the Southern States where only a few years ago it was hardly known. The old belief, that dairy operations could be carried on only within narrow limits, comprising those few States wherein the industry originated in this country, exists no longer. It has been proved that cows can be kept and good butter and cheese can be made in almost any district where suitable coarse fodder can be produced. It is often possible to grow more abundant and better fodder crops than are furnished by the natural grasses. Well or cistern water may take the place of the flowing spring. Freight rates and fast refrigerator-car transportation lines have the effect of placing the distant dairyman near the markets where grains can be purchased and his products can be disposed of to the best advantage. Dairying seems to be the one branch of agriculture least affected by conditions of soil and climate.

Dairying has many advantages over other kinds of farming. It improves the land instead of wearing it out, because the products of the dairy which leave the farm permanently are not rich in plant food, as is the case with field crops, and it provides fertilizer in the form of manure which is of immense value for enriching poor soil. It furnishes a profitable way of using certain farm products, such as grass and straw, that otherwise would be valueless. It provides a cheap by-product in the form of skimmed milk or whey, which can be very profitably fed to calves and other animals. It can be combined

with other forms of agriculture. Perhaps best of all, it engages the farmer in paying work for the entire year. It is for these reasons that the general appearance of any section where dairying is extensively followed, is one of thrift and progress. The growth of the dairy industry is sometimes checked temporarily by unfavorable economic conditions, such as high cost of feeds and high prices of beef, as well as by overproduction of dairy products.

The United States census for 1900 gives the following dairy statistics:

Cows on farms and ranges	17,139,674
Cows in towns and cities	973,033
Total cows in the United States	18,112,707
Total milk produced, gallons	7,728,583,350
Butter made on farms, pounds	1,071,745,127
Butter made in creameries and urban establishments, pounds	420,954,016
Total butter, pounds	1,492,699,143
Cheese made on farms, pounds	16,372,330
Cheese made in factories and urban establishments, pounds	282,332,774
Total cheese, pounds	299,006,818
Creameries and cheese factories, number	9,355
Average annual yield of milk, per cow, gallons	424

Alvord's estimates for 1903 are as follows:

Number of cows producing milk to be used,—	
For milk, cream and condensed milk	6,400,000
For making butter (151½ pounds each per year)	10,900,000
For making cheese (356 pounds each per year)	840,000
For rearing calves	860,000
Total cows, estimated	19,000,000

The aggregate annual value of dairy products is estimated to exceed $500,000,000. Exports of dairy products have always been small, as the great market for them is at home. The demands of foreign markets differ somewhat from domestic requirements, and as the latter are observed almost universally by makers of butter and cheese, an explanation is thus furnished of the fact that these products do not enjoy the highest reputation abroad. That butter and cheese which will fully satisfy foreign tastes can be supplied from this country has been proved many times by experience of exporters as well as by trial shipments made by the Department of Agriculture. There are great possibilities for American dairy products in other countries, and these will be developed as soon as our production is permanently in excess of our needs. During recent years the annual exports of butter have seldom exceeded 25,000,000 pounds, and those of cheese 75,000,000 pounds. The quantities and values exported (principally to Great Britain) in the fiscal year 1902 were: Butter, 16,002,169 pounds; value, $2,885,609; cheese, 27,203,184 pounds; value, $2,745,597. Through the efforts of a few American manufacturers of condensed milk an excellent grade of this article is rapidly becoming established in the world's markets. The value of condensed milk exported in the fiscal year 1902 was $1,473,564.

The best and most profitable breed of dairy cattle has as yet never been agreed upon. Each of about half a dozen different breeds has strong claims to highest merit and each has its enthusiastic advocates. The latter are often influenced by conditions which have no economic importance. Different breeds differ markedly in certain characteristics such as size, color, and disposition, as well as quantity and quality of milk. As a general rule, when a large amount of milk is given, it is low in fat-content or "richness." Interesting data regarding several leading dairy breeds of cattle have been compiled by Woll as follows:

Breed	Cows included	Lactation periods	Average yield per lactation period		Average fat	Average cost of		
			Milk	Butt'r fat		Food eaten per day	Producing 100 lbs. milk	Producing 1 lb. of fat
	No.	No.	Lbs.	Lbs.	Per c't.	Cts	Cts	Cts
Ayrshire	10	20	6,909	248.5	3.60	14.5	78.5	21.5
Devon	3	5	3,984	183.3	4.60	10.3	94.0	20.5
Guernsey	8	10	6,210	322.9	5.20	13.5	82.8	15.8
Holst'n-Fries'n	9	10	8,215	282.0	3.43	17.2	74.7	21.5
Jersey	9	18	5,579	301.1	5.40	13.9	94.7	17.4
Shorthorn	4	5	8,696	345.4	3.97	14.3	78.7	19.4

There is a wide variation in the milk production of different cows of any breed. Yields of milk amounting to 10,000 pounds (two and one seventh pounds to one quart) in one year are not rare. They are exceeded even by some Jerseys and Guernseys, whose milk is always of high quality. Records of over 20,000 pounds are credited to Holsteins, whose milk tests considerably lower in fat. The great majority of dairy cows throughout the country are "grades," that is, their blood represents different breeds and in no definite proportions. As producers of milk, individual grade cows can be selected that will equal thoroughbred animals, but the latter are more satisfactory for breeding purposes. Farrington reports a high grade Shorthorn cow in Wisconsin that gave in one year 11,131.7 pounds of milk containing 500 pounds of fat, an equivalent of 584 pounds of butter. The total feed consumed in the year cost $39.60. The total value of her butter and skimmed milk was $131.83. The cost of feed consumed for every pound of butter produced was only 6.7 cents. Too often the value of the annual product of a cow is very low,— even less than $25.00. It is a fact that on account of lack of business methods many such cows are kept at an actual loss to their owners.

Dairymen are divided upon the question as to the merits of the "single-purpose" and "dual-purpose" animals. The latter include those that can be profitably disposed of for beef when their period of usefulness in the dairy is ended. Advocates of the former think this advantage is purchased at a high cost and that the single-purpose cows are enough more profitable while in the dairy herd to permit of their final disposition at a low figure.

Milk of the cow is secreted in the mammary glands known as the udder. Wing thus well describes the udder of a good cow: "It should be large and well developed; it should occupy the whole space between the hind legs, extending well up between the thighs and well forward upon the belly. It should be held firmly against the wall of the abdomen. It should be level or nearly so on the bottom, and the four quarters should be as nearly as possible equally developed and each furnished with a cylindrical perpendic-

1. Stalls in a Modern Sanitary Cow Stable.

2. Cows in a Model Sanitary Stable.

ular teat of moderate length. The whole organ should diminish rapidly in size, as the milk is withdrawn. The hair upon the udder should be fairly abundant, fine and soft, and abundantly supplied with brownish dandruff.» As milk is a product of the blood, the importance of an ample blood supply to the udder, a vigorous constitution and a strong circulation is readily seen. It is highly important to withdraw the milk from the udder regularly, quietly and completely if the flow is to be maintained.

Van Slyke gives the average of 5,552 American analyses of cow's milk as follows:

Water	Total Solids	Fat	Casein	Albumin	Sugar	Ash
87.10	12.90	3.90	2.50	0.70	5.10	0.70

In addition to the constituents named, certain others are present in minute quantities. The average specific gravity of milk is 1.032. The composition of milk of different cows varies between wide limits. The same may be true of the product of any individual cow from day to day. The New York Agricultural Experiment Station is authority for the following averages of analyses of milks from cows of different breeds:

Breed	No. Analyses	Water	Total Solids	Solids not fat	Fat	Casein	Milk Sugar	Ash	Nitrogen	Daily Milk Yield
Ayrshire	252	86.95	13.06	9.35	3.57	3.43	5.33	0.698	0.543	18.40
Devon	72	86.26	13.77	9.60	4.15	3.76	5.07	.760	.595	12.65
Guernsey	112	85.39	14.60	9.47	5.12	3.61	5.11	.753	.570	16.
Holst'n-Fries'n.	132	87.62	12.39	9.07	3.46	3.39	4.84	.735	.540	22.65
Jersey	238	84.60	15.40	9.80	5.61	3.91	5.15	.743	.618	14.07

Koenig gives the variations of milk constituents in about 800 samples as follows:

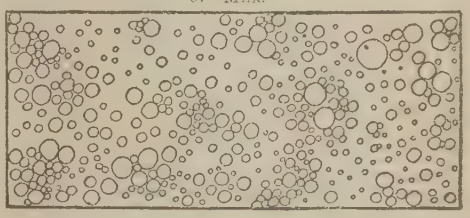
	Maximum	Minimum
Water	90.69	80.32
Fat	6.47	1.67
Casein	4.23	1.79
Albumin	1.44	.25
Sugar	6.03	2.11
Ash	1.21	.35

In some instances American analyses have found even wider variations.

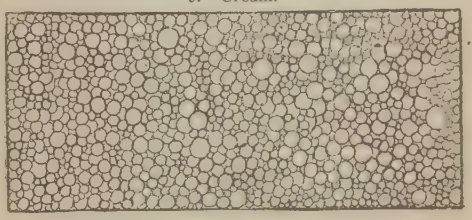
The most variable constituent of milk is fat. By it the «richness» of milk is judged and the commercial value is determined. Milk fat is a complex mixture containing several glycerine compounds. It is present in the form of minute globules suspended in the remaining or watery portion called the serum. The globules average about one ten thousandth of an inch in diameter and are plainly visible under a high power microscope. About 150,000,000 of them are contained in a single drop of milk. Some conditions affecting fat-content of milk have already been mentioned. There are a few others of importance. From about the middle to the last of the period of lactation, the fat in milk slightly increases. The percentage of fat increases gradually from the first to the last of any milking; the first milk drawn contains about 1 per cent fat and the last as high as 9 or 10 per cent. It is popularly supposed that the feed given a cow has a decided influence on the quality of her milk. As a matter of fact, the milk of a cow in normal condition is little affected in this manner. Feed has a much greater influence upon the quantity of milk than its quality. Casein and albumin are proteid or nitrogen constituents of milk. The former is coagulated by rennet or acid, the latter by heat. Coagulated casein or «curd» enters largely into the composition of cheese. Casein is said to be in a state of «pseudo-solution» in milk. Milk sugar or lactose is in solution in milk. When separated it resembles powdered sugar. It is less sweet than cane sugar and is used to a considerable extent in druggists' preparations and in certain proprietary foods. The mineral matter in milk, called ash or salts, is the part remaining when milk is evaporated to dryness and burned. It includes phosphorus, potassium, calcium, chlorine, magnesium, sodium, sulphur, and iron. Certain gases and other constituents are present in milk in minute quantities.

a. Skimmed milk.

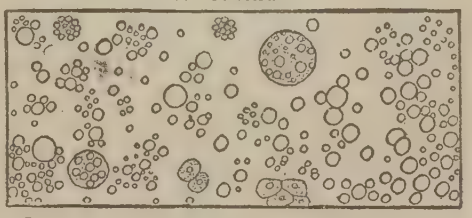
b. Milk.



c. Cream.



d. Colostrum.



Different grades of milk. (Magnified 300 times.)

The first milk given after parturition is called colostrum. It differs in composition from nor-

mal milk, and is fit only as food for the newly born calf.

The only precise method of determining the quality of milk is by a complete gravimetric analysis, but for practical purposes the knowledge of the specific gravity of milk and its fat-content is usually sufficient. The specific gravity can be quickly ascertained by the use of a lactometer, and the fat-content can be more or less accurately determined in a few minutes' time by any one of several quick tests. Of these the one in most general use and the most satisfactory is the Babcock test invented by Dr. S. M. Babcock of the University of Wisconsin. A definite amount of milk is mixed with sulphuric acid in a special bottle having a graduated neck. This is rapidly whirled in a machine and the fat is separated from the rest of the mixture by centrifugal force. By the addition of water the fat is brought up into the neck of the bottle, where its exact percentage can be read. Simple tests have been devised for determining the acidity of milk, and whether or not it has been heated.

Milk is a very delicate product and is subject to taints and changes in great number. It readily absorbs strong odors with which it comes in contact, and it is easily given objectionable flavors when the cows are allowed to eat certain foods within a few hours before milking. The flavors caused by garlic and rag-weed are well known; rape and green rye are claimed to produce bad flavors in the milk when they are fed in certain conditions. Flavors due to the causes named are most noticeable when the milk is first drawn from the udder, and may be largely reduced by aëration or the exposure of milk to the air. When held, milk undergoes many different kinds of changes. The most common is souring, but it may become slimy or "ropy," curdle without souring, become "soapy," turn to a red, blue, or other color, develop peculiar and disagreeable odors, form poisonous products, or become altered in other ways. Most of these changes are directly due to bacteria, but some are caused by enzymes or unorganized ferments. Bacteria find in milk an exceptionally favorable medium for growth. There are so many ways by which they enter that it is a practical impossibility to produce milk which is germ-free. But the character and number of the bacteria that get into milk and their development are largely controllable and have much to do with the success or failure of all operations with milk and its products. Many species of bacteria found in milk are perfectly harmless. Some are essential to certain dairy operations, for example, when it is desired to ripen cream to make butter, lactic acid bacteria are needed; they produce lactic acid from milk sugar and cause the milk or cream to sour. Other species have their peculiar effects in the ripening processes of the various forms of cheese. Numerous varieties of bacteria are objectionable and some are dangerous. The latter include pathogenic bacteria and other forms that may be the direct or indirect cause of disease to the consumer. Well authenticated cases are on record of typhoid fever, diphtheria, and other disease germs being carried by milk and there seems to be proof that tuberculosis is sometimes spread in this manner.

The number of bacteria ordinarily found in milk varies from a few thousand to more than a million per cubic centimetre. Most of the organisms entering milk are carried there by particles of dust, dirt, and foreign matter that fall into the milk from the attendants' hands and clothes, from the hairy coat of the cow and from the dust-laden atmosphere. Another fruitful source of contamination is furnished by milk utensils that have not been thoroughly cleaned. Bacteria thrive best at temperatures between 80 and 100° F. They grow slowly when the temperature is below 60° and there is very little development at temperatures below 45° F. Different methods of reducing bacteria in milk by removing them or killing them are in use. But these methods are only means for somewhat improving undesirable conditions which should have been prevented. When the bacterial content of milk is high because it contains considerable dirt, it can be somewhat reduced by filtering the milk through sand, cotton, or felt, or by passing it through a separator and recombining the streams of cream and skimmed milk. Certain chemicals of a disinfectant nature are sometimes put into milk for the purpose of destroying germ life. They are known as preservatives and the ones most commonly employed are salicylic acid, boracic acid, and formalin. Their use is highly objectionable and in some States and cities they are prohibited by law. Without doubt they inhibit the growth of bacteria, but there are reasons for believing they also reduce the food value of the milk. To a limited extent and for special requirements, milk is sterilized before use. Sterilization means the destruction of *all* germ life, and to accomplish this the milk must be heated to a high degree, sometimes above the boiling point, the exact temperature depending upon the resisting power of spores that happen to be present and the time of exposure. Or it must be treated by a method of intermittent heating, which is objected to on account of the successive heatings and coolings and the amount of work involved. It is generally believed that the digestibility and food value of milk are greatly reduced by subjecting it to high heat. The pasteurization of milk, by which most of the germs are destroyed by exposure to a comparatively low degree of heat, is favored by many authorities, especially when good, clean milk of low bacterial content cannot be secured. Exposure to 150° F. for 30 minutes followed by rapid and thorough cooling is a common practice. There is no definite rule about degree of heat and length of exposure, but the greater the heat and the longer the time, the more germs are destroyed. It is claimed that bacteria can be reduced from many thousand to less than one hundred per cubic centimetre by holding the milk at 156° F. for 30 minutes. Of course the keeping quality would thus be much improved. At about the temperature last named the milk albumin is coagulated and a cooked taste is acquired, hence that degree of heat is rarely exceeded in commercial work. The pasteurization of market milk is not a general practice, but it is gradually increasing. One of the chief objections to pasteurized milk may be stated. It is known that when several species of bacteria are growing in the same medium, some may retard or prevent the growth of others. When milk is heated and the more numerous forms of bacteria are killed a chance *may* be given to some dangerous form not affected by the degree of heat used, to multiply rapidly without restriction and thus to cause serious

results. When cream is pasteurized it becomes thin in appearance, but its "body" can be restored by the use of a lime preparation called "viscogen."

The successful management of a dairy requires great intelligence, patience, and persistence, and no person should expect to succeed in this business unless he has a decided liking for it. Of course the matter requiring first attention is the location of the farm. The elevation and conformation of the land should be such that good air and drainage would obtain. There should be an abundant supply of pure water. For this purpose a well-protected spring or deep well is best and care should be taken to have it located distant from buildings and other possible sources of contamination. Barns and dairy buildings should stand on elevated ground and they should be isolated from other structures. It is well to store all forage in a building separate from the cow stable. By a system of overhead tracks and suspended cars, feed can be easily brought to the herd and manure economically removed. Unless the manure can be spread at once upon the land, it should be stored under a roof. The stable should be planned to facilitate the work of caring for the herd. Light and fresh air are necessary and should be admitted in abundance. It is generally advised that there be allowed at least one cubic foot of space for every pound of live weight. Where the winters are not too cold and expense of construction must be kept low, the cows may be allowed to stand on the ground, the floor of the barn being made from hard packed clay or earth. Better floors are made from planks treated with tar and laid close together. A cement floor is the best, but because of its hardness an abundance of bedding must be used. The stalls should be from three and a half to four feet wide and just long enough so that when the cow is standing, the manure gutter will be immediately back of the hind feet. Many devices for tying cows have been proposed, but one of the most satisfactory is the stanchion attached above and below by a few links of chain, so as to allow some freedom of motion in all directions. A separate feeding box for each animal is objectionable because of the difficulty of keeping it clean. At many of the best dairies the cows are fed on the floor, a long shallow trough in front of the stalls being constructed for this purpose. Provision should be made for frequent access to water. Milch cows should be allowed to go out doors every pleasant day for exercise.

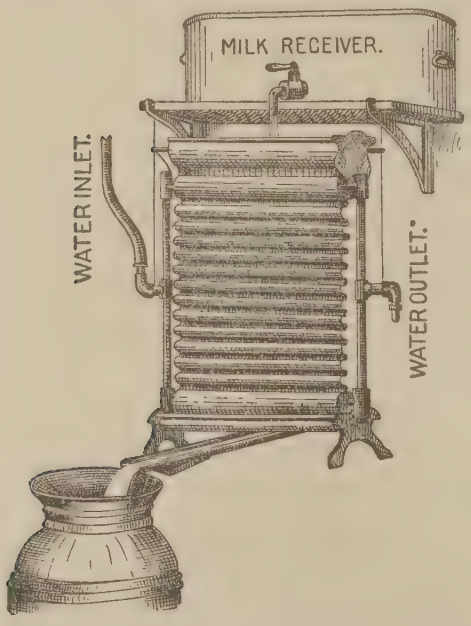
The selection of cows for a dairy herd, regardless of the breed chosen, should be based upon individual merit. Small and unprofitable producers as well as unhealthy cows and those of weak constitution should be avoided, and when they are found in the herd, advantage should be taken of the first opportunity to displace them. It is well said "the bull is half the herd." When calves are to be raised, as is the rule in most dairies, the influence of the bull upon the development of the herd is readily seen. If possible a bull of proved excellence should be used. It is always well to give special attention to the breeding of the bull and attach considerable importance to the performances of his dam and grand-dams. The quantity of milk given by each cow, and its fat test, should be recorded at least one day every two weeks for the purpose of showing which animals of the herd are profitable and which are not. The time for breeding cows depends upon the requirements for milk. Formerly it was the general practice in dairies not supplying milk for retail sale to have cows calve in the spring and be "dry" throughout the winter. At the present time, however, a large number of dairies are operated most profitably during the winter for the purpose of supplying milk for butter and cheese making, as well as for consumption in towns and cities.

Feeding for best results is a subject which requires much study and experience. Especially is this the case where winter dairying is practised. In the first place feed should be wholesome and palatable. Then care should be taken to have the nitrogenous and non-nitrogenous components properly proportioned. Just what feeds will be used depends largely upon local conditions, cost, availability, etc. Practical rations as fed in different parts of the country and reported by Woll are as follows: New York, 20 pounds hay, 2 pounds wheat bran, 2 pounds cotton-seed meal, 2 pounds hominy meal. Vermont, 30 pounds corn silage, 10 pounds hay, 4.2 pounds corn meal, 4.2 pounds wheat bran, 8 pounds linseed meal. Wisconsin, 26 pounds corn silage, 10 pounds clover hay, 5 pounds timothy hay, 8 pounds wheat middlings, 1½ pounds oil meal. Most coarse fodders are low in nitrogenous component or protein; of these, the leguminous plants contain the highest percentages of protein. The concentrated feeding stuffs commonly used and containing the most protein, are cotton-seed meal, linseed meal, gluten meal, dried brewer's grains, wheat middlings, and wheat bran.

Changes in methods of feeding which are especially marked at the present time include the growing use of ensilage and the increasing practice of "soiling" or cutting green feeds of different kinds and bringing these to the animals instead of allowing them to graze.

Milk should be produced and handled in such a manner as to keep bacterial contamination as low as possible. The practical way of accomplishing this is to observe the utmost cleanliness in all the stages of production, to cool the milk at least to 45° F. promptly after it is drawn and to hold it continuously at such low temperature. As pathogenic or disease-producing bacteria are the most dangerous of all forms ever found in milk, special care should be taken to exclude them. For this purpose it is necessary to give close attention to the health of the animals and all persons having to do with the herd or the milk. Serious outbreaks of disease have been due to the handling of milk by persons suffering only mildly with a contagious disease such as typhoid fever or who have been exposed to the disease. Dairy cows should be examined at least three times every year by a competent veterinarian; some of the best dairies have examinations more often. The milk of a cow suspected of being out of condition or not in good health should not be used. By far the largest number of bacteria that enter milk are carried by small particles of foreign matter, such as manure, dust, dirt, hairs, etc. Of course these are most abundant in illy-kept barns where milkers as well as the cows and their surroundings are allowed to be unclean. Barns should be kept thoroughly clean. The use of pine shavings for bedding contributes much to

cleanliness and they are now found in many of the best dairies. Barns should be so constructed and the work should be so planned that there would be no occasion for unnecessary dust in the atmosphere at the time of milking. Milch cows should be "groomed" daily, and udders should always be cleaned just before milking, with the aid of a brush and a damp cloth. As bacteria are liable to be especially numerous in the milk nearest the teat opening, it is a good practice to discard the first few streams drawn. The operation of milking should be performed in a quiet manner. Freeman has shown that the milk drawn by a man who violently agitates the udder may contain 10 times as many bacteria as that drawn by a quiet milker. Milk should not be used until the fourth or fifth day after calving. In addition to being in good health and avoiding exposure to contagion, the attendants in a dairy should be personally clean. Too often this important matter is overlooked and milk is considerably infected by germs from dirty garments and dirty hands. A special clean suit should be put on and hands should always be thoroughly cleaned before milking. The practice of "wet" milking is extremely filthy. All dairy utensils should



Milk cooler and aërator for use with running water.

be simply constructed and easily cleanable. They should not be made of any open or porous material such as wood. Immediately after use they should be cleaned and then sterilized by boiling water, or better, steam. Milk should be promptly removed from the stable, strained, cooled, and cold-stored. It should be handled in a room specially fitted for the purpose,— fresh, clean, and light. A good form of strainer is provided with the usual wire gauze of fine mesh and a double thickness of sterile cheese cloth filled between with pure white sterile cotton. The cloth and cotton should be changed as often as they commence to show dirt near the lower surface. The usual cooling device serves also as an aërator and consists of an aparatus made of thin metal and so arranged that cold water is on one side while the milk being cooled passes over the other. By certain forms of coolers, it is found entirely practicable to quickly bring the temperature of the milk to within 2 to 4° of the temperature of the water. After cooling, milk should be placed in cans or jars, as may be required, and held at a low temperature continuously until used. Recently it has become the practice in a few places and to a limited extent to put milk intended for consumption into glass jars and seal it within a few minutes after it is taken from the cow, and then cool it. This seems to be satisfactory when the milk is exceptionally pure and in no need of aëration. When milk is to be used for butter and cheese making it is not necessary for it to be held at so low a temperature as when it is to be used for retail trade, for the reason that the development of a certain amount of acidity is desirable. This is fortunate for dairymen who happen to have neither cold springs nor ice. Their milk may be delivered to the butter and cheese factory while perfectly fresh, but as high as 80° F., and yet be used in the manufacture of the best butter or cheese.

Items that need to be kept in mind and conditions which should be observed in the management of a first-class dairy are summarized in 'Fifty Dairy Rules' composed by the writer and issued by the United States Department of Agriculture, as follows:

FIFTY DAIRY RULES.

THE OWNER AND HIS HELPERS.

1. Read current dairy literature and keep posted on new ideas.
2. Observe and enforce the utmost cleanliness about the cattle, their attendants, the stable, the dairy, and all utensils.
3. A person suffering from any disease, or who has been exposed to a contagious disease, must remain away from the cows and the milk.

THE STABLE.

4. Keep dairy cattle in a room or building by themselves. It is preferable to have no cellar below and no storage loft above.
5. Stables should be well ventilated, lighted, and drained; should have tight floors and walls and be plainly constructed.
6. Never use musty or dirty litter.
7. Allow no strong smelling material in the stable for any length of time. Store the manure under cover outside the cow stable and remove it to a distance as often as practicable.
8. Whitewash the stable once or twice a year; use land plaster in the manure gutters daily.
9. Use no dry, dusty feed just previous to milking; if fodder is dusty, sprinkle it before it is fed.
10. Clean and thoroughly air the stable before milking; in hot weather sprinkle the floor.
11. Keep the stable and dairy room in good condition, and then insist that the dairy, factory, or place where the milk goes be kept equally well.

THE COWS.

12. Have the herd examined at leace twice a year by a skilled veterinarian.
13. Promptly remove from the herd any animal suspected of being in bad health, and reject her milk. Never add an animal to the herd until certain it is free from disease, especially tuberculosis.
14. Do not move cows faster than a comfortable walk while on the way to place of milking or feeding.
15. Never allow the cows to be excited by hard driving, abuse, loud talking, or unnecessary disturbance; do not expose them to cold or storms.
16. Do not change the feed suddenly.

17. Feed liberally, and use only fresh, palatable feedstuffs; in no case should decomposed or moldy material be used.
18. Provide water in abundance, easy of access, and always pure; fresh, but not too cold.
19. Salt should always be accessible.
20. Do not allow any strong flavored food, like silage, turnips, cabbage, and garlic, to be eaten, except immediately after milking.
21. Clean the entire body of the cow daily. If hair in the region of the udder is not easily kept clean it should be clipped.
22. Do not use the milk within 20 days before calving, nor for 3 to 5 days afterward.

MILKING.

23. The milker should be clean in all respects; he should not use tobacco; he should wash and dry his hands just before milking.
24. The milker should wear a clean outer garment, used only when milking, and kept in a clean place at other times.
25. Brush the udder and surrounding parts just before milking, and wipe them with a clean, damp cloth or sponge.
26. Milk quietly, quickly, cleanly, and thoroughly. Cows do not like unnecessary noise or delay. Commence milking at exactly the same hour every morning and evening, and milk the cows in the same order.
27. Throw away (but not on the floor, better in the gutter) the first few streams from each teat; this milk is very watery and of little value, but it may injure the rest.
28. If in any milking a part of the milk is bloody or stringy or unnatural in appearance, the whole mess should be rejected.
29. Milk with dry hands; never allow the hands to come in contact with the milk.
30. Do not allow dogs, cats, or loafers to be around at milking time.
31. If any accident occurs by which a pail full or partly full of milk becomes dirty, do not try to remedy this by straining, but reject all this milk and rinse the pail.
32. Weigh and record the milk given by each cow, and take a sample morning and night, at least once a week, for testing by the fat test.

CARE OF MILK.

33. Remove the milk of every cow at once from the stable to a clean, dry room, where the air is pure and sweet. Do not allow cans to remain in stables while they are being filled.
34. Strain the milk through a metal gauze and a flannel cloth or layer of cotton as soon as it is drawn.
35. Aërate and cool the milk as soon as strained. If an apparatus for airing and cooling at the same time is not at hand, the milk should be aired first. This must be done in pure air, and it should then be cooled to 45 degrees if the milk is for shipment, or to 60 degrees if for home use or delivery to a factory.
36. Never close a can containing warm milk which has not been aërated.
37. If cover is left off the can, a piece of cloth or mosquito netting should be used to keep out insects.
38. If milk is stored, it should be held in tanks of fresh, cold water (renewed daily), in a clean, dry, cold room. Unless it is desired to remove cream, it should be stirred with a tin stirrer often enough to prevent forming a thick cream layer.
39. Keep the night milk under shelter so rain cannot get into the cans. In warm weather hold it in a tank of fresh cold water.
40. Never mix fresh warm milk with that which has been cooled.
41. Do not allow the milk to freeze.
42. Under no circumstances should anything be added to milk to prevent its souring. Cleanliness and cold are the only preventives needed.
43. All milk should be in good condition when delivered. This may make it necessary to deliver twice a day during the hottest weather.
44. When cans are hauled far they should be full, and carried in a spring wagon.
45. In hot weather cover the cans, when moved in a wagon, with a clean wet blanket or canvas.

THE UTENSILS.

46. Milk utensils for farm use should be made of metal and have all joints smoothly soldered. Never allow them to become rusty or rough inside.
47. Do not haul waste products back to the farm in the same cans used for delivering milk. When this is unavoidable, insist that the skimmed milk or whey tank be kept clean.
48. Cans used for the return of skimmed milk or whey should be emptied and cleaned as soon as they arrive at the farm.
49. Clean all dairy utensils by first thoroughly rinsing then in warm water; then clean inside and out with a brush and hot water in which a cleaning material is dissolved; then rinse and lastly sterilize by boiling water or steam. Use pure water only.
50. After cleaning, keep utensils inverted, in pure air, and in as much sunlight as possible, until wanted for use.

Milk is a food of great value. Next to bread and water it is used more commonly than any other article of food or drink. It contains in easily digestible form the four kinds of nutrients required by the body,—protein, fats, carbohydrates and mineral matter. With few exceptions it contains more nutritive matter than can be obtained at the same cost in any other food. Jordan has shown the economy of using milk in the family dietary. The increased use of good wholesome milk is strongly recommended. Skimmed milk also contains considerable food value and could well be used as a human food much more than is the present custom. The average amount of milk consumed daily in cities and towns is about one half pint per capita and to supply this there must be within easy reach one cow for about every 12 persons. Many cows are kept within corporate limits and their product is delivered twice daily,—often "warm from the cow." For best results it should be cooled promptly, but it is generally used before any considerable change takes place. Most of the milk supply of small and medium-sized towns and a large portion of the milk used in cities is taken from the dairy to the consumer by teams, and the general rule is to serve in the morning the product of the same morning and previous evening.

The bulk of the milk used in large cities is transported by special trains and sometimes these originate as far as 200 to 300 miles from their destination. "Train" milk varies from 12 to 48 hours old when delivered to the consumer. Most of it is either 24 or 36 hours old. Producers, dealers, and shippers have learned that milk so long delayed must receive good care, and it often happens that this milk is finally delivered in better condition than milk less old, but neglected. The receipts of milk in New York city are over 1,335,000 quarts daily, and practically all is brought by trains. Milk is usually transported in heavy tin cans holding 8½, 20, 30, or 40 quarts. In recent years bottles have come into use and they are gradually increasing in favor. Some concerns maintain bottling stations near the producing farms, and their product is shipped in glass jars which are packed in cracked ice during hot weather. Much milk is bottled in the cities before delivery.

Farmers usually receive two to three cents per quart for their milk in the summer and one cent more in the winter. City retail prices range from 6 to 10 cents per quart. Most milk is delivered promptly after it reaches the city. When it must be held before delivery a clean, cold place must be provided for this purpose. The best results with milk in cans or bottles is obtained when these are stored in tanks of ice water. Cream cans should be buried in cracked ice. If the products are thoroughly cold they may be held satisfactorily in cold, dry air.

Much is being done by State and municipal governments to improve market milk, but the greatest influence to this end that can be produced is a determined demand on the part of the consumers for pure milk and a willingness to pay for it. Medical milk commissions in a few cities are entitled to credit for good results already obtained. In New York and Philadelphia several concerns are distributing milk which is produced and handled under the supervision of commissions of physicians. These concerns are pioneers and deserving of great credit. It is their aim to produce milk in a scientific manner and to take every reasonable measure to insure its purity. One of them operates in 16 different cities and conducts dairies which are models in cleanliness and management. The same company has developed a large trade in "modified milk," which is milk altered in its composition according to the peculiar requirements of infants and invalids, and specially prepared upon physicians' prescriptions. The comparatively few high-class dairies now in operation are doing much to stimulate a wholesome interest in the subject.

Kumiss is one of the forms of fermented milk used as a beverage. It is produced with the aid of yeast.

The principal American publications on dairying, exclusive of butter and cheese, include the following: Wing, 'Milk and Its Products' (1897); Conn, 'Dairy Bacteriology' (1903); Farrington and Woll, 'Testing Milk and Its Products' (1897); Grotenfelt, 'Principles of Modern Dairy Practice' (1894); Freeman, 'Low Temperature Pasteurization of Milk' (1896); Jones, 'Dairying for Profit' (1894); Monrad, 'Pasteurization and Milk Preservation' (1895); Russell, 'Outlines of Dairy Bacteriology' (1894); Snyder, 'The Chemistry of Dairying' (1897); also 'Hoard's Dairyman,' weekly periodical and bulletins issued by the Department of Agriculture and by experiment stations in the several dairy States.

RAYMOND A. PEARSON,
Gen. Mgr. of the Walker-Gordon Laboratory Co.

Dais, dā'ĭs, a platform or raised floor at the upper end of an ancient dining-hall, where the high table stood; also a seat with a high wainscot back, and sometimes with a canopy, for those who sat at the high table. The word is also sometimes applied to the high table itself.

Daisy, the popular English name of a plant of the genus *Bellis* of the natural order *Compositæ*. Properly the name belongs to the English daisy (*B. perennis*). This is a native of Europe and Asia, and is one of the most common of the flowers of England. In the United States the English daisy is generally found in gardens, but it has escaped in some cases, and may be found growing in waste places or on lawns from Nova Scotia through New England and southern New York to eastern Pennsylvania. It has been naturalized in California and British Columbia. One species of the true daisy, the western daisy (*B. integrifolia*), is a rare plant found in moist soil from Kentucky and Tennessee to Arkansas and Texas. The flowers generally called daisies in the United States belong to the chrysanthemum family, although some asters are also given the common name.

Daisy Miller, a novelette by Henry James, published in 1878. From the constant incongruity between the Miller social standards and the Draconian code of behavior of the older European communities, come both the motive and the plot of the story.

Dak, dăk, or **Dawk,** a Hindu word used in India for the mail or post; a relay of men, as for carrying letters, despatches, etc., or travelers in palanquins. The route is divided into stages, and each bearer, or set of bearers, serves only for a single stage. A dak-bungalow is a house at the end of the stage designed for those who journey by palanquin.

Dakar, dä-kär', Senegal, a port furnishing one of the best harbors on the west coast of Africa. It is situated near Cape Verde. There is a railroad between the port and the capital, Saint Louis. Dakar is a fortified military post. Pop. (1902) 12,000.

Dako'ta, or **Dakotah,** a tribe of North American Indians, constituting at one time an important element in the great Sioux group. They were reported numerous in the 17th and 18th centuries, and roamed over extensive hunting grounds in parts of the present States of North Dakota and South Dakota. The tribe consisted of six sub-tribes: (1) Santee; (2) Sisseton; (3) Yankton; (4) Wahpeton; (5) Yanktonnai; (6) Teton. These sub-tribes were divided into bands or groups; as, the Tetons consisted of the Brulé, Blackfeet, and other groups. The Dakotas were fond of war and when not fighting against outsiders would sometimes fight among themselves. In 1658 they had 30 towns on the Mississippi, the Missouri, and Saint Croix. The old war spirit has not died out; in 1862 a portion of the tribe attacked the whites and killed about 1,200. In 1890–1 the whites feared another uprising when the ghost-dance took place at the Pine Ridge agency. The Dakotas are located in the United States, chiefly in North and South Dakota, Nebraska, and Montana. There are about 900 in Canada, and in the United States about 2,800. See INDIAN SCHOOLS; RESERVATIONS; SIOUAN.

Dakota. See NORTH DAKOTA; SOUTH DAKOTA.

Dakota River. See JAMES RIVER.

Dakota Stage, one of the formations of the Upper Cretaceous series in the United States. The rocks, mostly conglomerates and sandstones, cover a vast area extending over the Great Plains from Texas northward into Canada. Their origin is still a matter of speculation, since they are not marine; and in Texas lie unconformably upon the Comanche limestone. West of the Rocky Mountain uplift the Dakota rocks are more fine-grained, and include beds of coal or lignite of workable thickness. In much of the Rocky Mountain region the Dakota rests conformably upon Lower Cretaceous and even Jurassic strata. The exact equivalent of the Dakota stage along the eastern border of the United States is undetermined. The lower cross timber sand of Georgia and Mississippi is probably equivalent to the Dakota. See CRETACEOUS SYSTEM.

Daksha, däk'shä, in Hindu mythology, a priest to whom Siva gave a ram's head out of revenge, because he did not invite the god to his grand sacrifice.

Dal, däl, a Swedish word signifying, like the German *Thal,* valley, as in Dalecarlia.

Dalaguete, dä-lä-gā'tā, Philippines, a town on the southeast coast of Cebú, 44 miles southwest of the town of Cebú. Trade in the products raised in the interior is carried on with the adjacent islands. In two years the population increased about 2,000. The town would be of more importance as a port of entry, but it has little or no protection from the northeast monsoons and from the south winds. Pop. 21,825.

Dalberg, däl'bĕrg, **Karl Theodor,** Prince and Archbishop of Mayence, chancellor of the empire, and elector: b. 1744; d. Ratisbon 10 Feb. 1817. Having made his academic studies in the universities of Göttingen and Heidelberg, he devoted himself to the study of canon law and entered the ecclesiastical state. In 1772 he was made, by the Elector-Archbishop of Mayence, privy counselor and governor of Erfurt. His administration was directed purely to the welfare of the people and he earned the reputation of being a faithful and capable man of affairs. He continued in the service of the elector, and at the death of his patron he succeeded him as archbishop, elector, and archchancellor of the empire (1802). In 1804 the Pope, Pius VII., being then in Paris for the occasion of the crowning of Napoleon, Archbishop Dalberg was invited by Napoleon to Paris for the purpose of inducing Pope Pius to approve a proposed readjustment of ecclesiastical affairs in Germany. The Archbishop served well the interests of the French emperor, and later had his reward when the readjustment was effected, for, though he had to give up the archiepiscopal see of Mayence and his dignities in the empire, he was more than recompensed by being made metropolitan of Ratisbon, while Aschaffenburg, Wetzlar, and Ratisbon were erected, on his behalf, into a princedom. Further his purely ecclesiastical jurisdiction was enlarged by being made to extend over such parts of the ecclesiastical jurisdiction of Mayence, Cologne, and Treves as lie on the right bank of the Rhine. But of all these dignities and powers, except the archbishopric of Ratisbon, he was deprived after the fall of Napoleon. He was a man of learning, a lover and patron of art, and the intimate friend of Goethe, Schiller, Wieland, and the great contemporary lights of German literature. He was author of several works on philosophy and æsthetics (much consulted by scholars), and he took a lively interest in natural history, mineralogy, chemistry, and agriculture.

Dalber'gia, a genus of fine tropical forest trees and climbing shrubs, natural order *Leguminosæ,* some species of which yield excellent timber. *D. latifolia* (the blackwood, or East Indian rosewood) is a magnificent tree, furnishing one of the most valuable furniture woods. *D. sissoo* gives a hard durable wood, called sissoo, much employed in India for railroad sleepers, house- and ship-building, etc.

D'Albert, däl-bär, **Eugene,** English musician: b. Glasgow, Scotland, 10 April 1864. He is the son of an English composer of French descent. He was at first trained by his father, but subsequently studied with Sir Arthur Sullivan and Dr. Stainer, and after 1882 was a pupil of Liszt. He is very famous as a pianist and has given recitals in the chief cities of Europe and the United States. Besides concertos, string quartettes, songs, etc., he has composed the operas of 'Ruby'; 'Ghismonda'; 'The Departure'; etc.

Dalby, Isaac, English mathematician: b. Gloucestershire 1744; d. Farnham, Surrey, 3 Feb. 1824. He was self-educated, and while teaching arithmetic in London, his acquirements became known. In 1782 he was appointed mathematical master of the naval school at Chelsea, and in 1787 was employed, on the recommendation of the celebrated instrument-maker Ramsden, to assist Gen. Roy in the great trigonometrical survey. In 1799, on the formation of the Royal Military College at High Wycombe, he was appointed professor of mathematics, and continued to hold the appointment till 1820.

Dale, Alan (Alfred J. Cohen), American dramatic critic: b. Birmingham, England, 14 May 1861. After leaving Oxford University he came to the United States and was dramatic critic on the New York *Evening World* 1887–95, and on the New York *Journal* from 1895. He has published: 'Jonathan's Home'; 'A Marriage Below Zero'; 'An Eerie He and She'; 'My Footlight Husband'; 'A Moral Busybody'; etc.

Dale, David, Scottish manufacturer: b. Stewarton, Ayrshire, 6 Jan. 1739; d. Glasgow 17 March 1806. He commenced life as a weaver, and having made the acquaintance of Sir Richard Arkwright a partnership was entered into between them for the erection of cotton-mills on the Clyde, and the settlement of New Lanark was in consequence formed. He had also extensive shares in other spinning factories established under his superintendence in various parts of Scotland, and was head partner in a large manufacturing firm in Glasgow, besides acting there as agent for the Royal Bank of Scotland. In 1799 he retired from business, and disposed of the works at New Lanark to a company of English capitalists, who entrusted the management of them to the celebrated Robert Owen (q.v.), who afterward married Mr. Dale's eldest daughter. He was the founder and pastor of a small religious sect called "Dalites," or "Old Independents."

Dale, Richard, American naval officer: b. Norfolk, Va., 6 Nov. 1756; d. Philadelphia 24 Feb. 1826. While serving as a midshipman on board of the American brig of war, Lexington, he was taken by a British cutter; but, after being confined a twelvemonth in prison, he effected his escape into France, where he joined the celebrated Paul Jones, then commanding the American ship Bon Homme Richard, and was the first man that boarded the English frigate Serapis, which was captured. In 1801 he had the command of an American squadron and hoisted his pennant on board the President.

Dale, Robert William, English Congregational clergyman: b. London 1 Dec. 1829; d. 13 March 1895. He was for many years one of the foremost of non-conformist leaders in England, and in 1877 delivered a series of lectures on preaching at Yale University, being the first Englishman appointed to the Lyman Beecher lectureship. Among his more important writings are: 'The Atonement' (1875); 'Lectures on Preaching' (1877); 'The Epistle to the Ephesians: its Doctrine and Ethics' (1882);

'The Living Christ and the Five Gospels' (1890); 'Fellowship of Christ' (1891). He was a versatile and powerful speaker and exercised an extended influence, both in the United States and England.

Dalhousie, dăl-hoo'zĭ or dăl-how'zĭ, **James Andrew Ramsey,** 10TH EARL AND 1ST MARQUIS OF, British statesman: b. near Edinburgh 22 April 1812; d. 19 Dec. 1860. After filling the offices of vice-president (1843) and president of the board of trade (1844), he was appointed governor-general of India (1847). In the administration of Indian affairs he showed marked ability and great talent, establishing railway lines, telegraphs, irrigation works, etc., and under his rule was annexed the Punjab, Oude, Berar, and other native states, as well as Pegu in Burma, to the British Empire in India. In 1849 he was made a marquis.

Dalhousie, New Brunswick, capital of Restigouche County, and a port of entry. It is situated on Chaleurs Bay and the estuary of Restigouche River. The chief industries are fishing and trading in lumber, salmon, and lobsters. Pop. (1901) 3,000.

Dalhousie College and University, an institution of learning located at Halifax, N. S. It was founded in 1818 by the Rt. Hon. George Ramsay (q.v.), 9th earl of Dalhousie, whose last public act in Nova Scotia was the laying of the corner stone of the old building, 22 May 1820, but it was not until 13 Jan. 1821 that the "bill to incorporate the Governors of Dalhousie College at Halifax" became a law. The purpose of the college as originally stated was "for the education of youth in the higher branches of science and literature," and "to be open to all occupations and sects of religion." The first name of Dalhousie was the "College of Halifax," but in 1821 the legislature granted £1,000 to the new college and named it after its founder. In 1841 university powers were granted to the college. The early history of Dalhousie is a brave struggle for existence. Two attempts were made to unite it with King's College (q.v.), but both proved failures. From 1844 to 1863 Dalhousie ceased to operate as a college, and the governors either allowed the funds to accumulate or managed it as a high school. In 1863, the college was reorganized, with a staff of six professors, a tutor in modern languages, and about 60 students. The governing powers of the institution are (1) the board of governors, the supreme governing body; appointments to it are made by the governor-in-council on the nomination of the board. The governors have the management of the funds and the property of the college; the power of appointing the president, professors, and other officials, and of determining their duties and salaries, and the general oversight of the work of the university. (2) The Senate, consisting of the presidents and professors. To this body are entrusted, by statute, the internal regulations of the university, subject to the approval of the governors. All degrees are conferred by the Senate. (3) The faculties of Arts, Science, Law, and Medicine. These are committees of the Senate for the supervision of the teaching of the university, the preparation of regulations governing the courses of study, and the recommendation of suitable candidates for prizes, scholarship, diplomas, and degrees. In addition to the courses in the liberal arts and in pure science, the university has schools of law, medicine, and engineering. The university is well equipped for its work and is constantly enlarging its sphere of usefulness. It has a large student body and admits students of either sex. Many generous gifts have been made to Dalhousie, notably those of the late George Munro of New York, from 1879 to 1884, which did much to put the institution on a solid financial basis. Alexander McLeod, of Halifax, Sir William Young, and John P. Mott have also made large gifts.

JOHN FORREST,
President of the College.

Dalin, dä'lĭn, **Olof von,** Swedish historian and poet: b. Vinberga, Holland, 29 Aug. 1708; d. Drottingholm 12 Aug. 1763. In 1737 he was appointed royal librarian, and in 1751 became preceptor to the prince royal (afterward Gustavus III.), and in recompense for his zeal and talents was nominated historiographer-royal (1759), and chancellor of the court of Sweden (1763). He exerted much influence by his periodical paper, 'The Swedish Argus' (1733–4), and still more by his spirited poems, particularly 'Satires' (1729), an excellent poem on the liberty of Sweden (1742), many songs, epigrams, and fables. The best edition of his poetical works appeared at Stockholm (1782–3). He acquired equal reputation by his able history of Sweden (1777).

Dall, Caroline Wells Healey, American author: b. Boston, Mass., 22 June 1822. She has been an industrious literary worker, and is the author of many books, among which are: 'Essays and Sketches' (1849); 'Woman's Right to Labor' (1860); 'The College, the Market, and the Court' (1861); 'Egypt's Place in History' (1868); 'Patty Gray's Journey to the Cotton Islands,' and 'What We Really Know About Shakespeare' (1885).

Dall, William Healey, American naturalist: b. Boston, Mass., 21 Aug. 1845. He is the son of Caroline W. H. Dall (q.v.). He is a member of the United States Geological Survey and of many of the scientific societies at home and abroad. Among his published books are: 'Alaska and its Resources' (1870); 'The Currents and Temperatures of Bering Sea and the Adjacent Waters' (1882).

Dallas, Alexander James, American statesman: b. Island of Jamaica 21 June 1759; d. Trenton, N. J., 14 Jan. 1817. He studied law in London and settled in Philadelphia in 1783. He became eminent at the bar, and was United States district attorney in Pennsylvania from 1801 to 1814. He was secretary of the treasury under Madison.

Dallas, George Mifflin, American diplomatist: b. Philadelphia, Pa., 10 July 1792; d. there 31 Dec. 1864. He was the son of A. J. Dallas (q.v.). In 1813 he was admitted to the bar, and soon after entered the diplomatic service. In 1831 he was elected a United States senator from Pennsylvania; was United States minister to Russia 1837–9, and in 1844 was elected Vice-President of the United States. In 1846 his casting-vote as president of the Senate repealed the protective tariff of 1842, though he had

previously been considered a Protectionist. His course on this question aroused much indignation in Pennsylvania. He was United States minister to Great Britain from 1856 to 1861. His principal published writings were posthumous, and include a 'Series of Letters from London' (1869), and a 'Life of A. J. Dallas' (1871).

Dallas, Ga., town, county-seat of Paulding County; on the Southern Railroad; about 30 miles northwest of Atlanta. Pop. 700.

Dallas, Ga., Battle Lines at. After the Confederate evacuation of Dalton (see DALTON, GA., MILITARY OPERATIONS AT), 12 May 1864, and the battle of Resaca, 14–15 May, Gen. Joseph E. Johnston's army retreated by way of Calhoun and Adairsville to Cassville, where Gen. Johnston prepared to make a stand, and Gen. Sherman closed in on him for battle; but Johnston abandoned Cassville during the night of the 19th, and next day crossed to the south side of the Etowah. Sherman occupied Cassville and Kingston, and prepared for another advance. As Johnston held the line of the railroad at Allatoona Pass and other points in advance of Marietta, Sherman concluded to turn those positions by moving from Kingston to Marietta by way of Dallas, a small town about 25 miles south of Kingston and 20 miles west of Marietta, and the converging point of many roads. On the 23d the movement began, but on the same day the Confederate cavalry discovered it, and Johnston divined its intention and prepared to check it by marching to Dallas and covering the roads leading to it.

On the 25th as the advance of Hooker's (Twentieth) corps neared Dallas it was discovered that Hood's Confederate corps held the cross roads at New Hope Church, four miles northeast of Dallas. Hooker concentrated his corps and attacked Hood late in the evening and was repulsed with a loss of 1,346 killed and wounded, and about 60 missing. Hood's loss was less than 400. During the night and early next day the rest of the army moved up on the right and left of Hooker and entrenched, McPherson's two corps, on the right, holding Dallas.

Sherman gradually extended to the left, skirmishing heavily all along the line, and on the evening of the 27th T. J. Wood's division of the Fourth corps attacked the extreme right of the Confederate army near Pickett's Mill and, after a most gallant effort, was repulsed with a loss of 1,224 killed and wounded, and 318 missing. The Confederates reported a loss of 85 killed and 363 wounded. This engagement was a little over two miles northeast of New Hope Church.

There was now heavy skirmishing all along the line, some seven miles in length; and Sherman, still extending to the left, ordered McPherson, who was entrenched at Dallas, to close in on Hooker at New Hope Church, that Hooker might extend to the left; but McPherson deferred the movement until next day (28th), and was getting ready to make it when he was attacked. The Confederates made a desperate effort to seize his works, but were repulsed with a loss of some 390 killed and wounded. McPherson's loss was over 400, of whom 325 were killed and wounded, and 54 missing, in the Fifteenth corps, which bore the brunt of the assault. This was the battle of Dallas.

Sherman continued his movement to the left; McPherson left Dallas 1 June, and closed in on Hooker at New Hope Church; Hooker went to the left; all the wagon roads leading to Allatoona and Ackworth were secured. Allatoona was seized, also the railroad back to the Etowah, and 4 June Sherman was preparing to attack Johnston at New Hope Church, when he found that he had abandoned all his works and fallen back to Kenesaw Mountain; whereupon Sherman moved to the railroad at Ackworth and Big Shanty, and the first stage of the campaign for Atlanta ended. The Union loss in the battles and constant heavy skirmishing near and at Dallas (25–31 May) was about 3,600 killed and wounded. Johnston reports the Confederate loss at 2,005 killed and wounded. The first stage of the campaign (6–31 May) cost the Union army 9,299 killed, wounded, and missing, Johnston reports the Confederate loss for the same period at 5,807 killed and wounded. Consult: 'Official Records,' Vol. XXXVIII.; Van Horne, 'History of the Army of the Cumberland,' Vol. II.; Cox, 'Atlanta'; Johnston, 'Narrative'; Sherman, 'Memoirs,' Vol. II.; the Century Company's 'Battles and Leaders of the Civil War,' Vol. IV. E. A. CARMAN.

Dallas, Ore., city, county-seat of Polk County; situated on La Creole Creek and the Southern Pacific Railroad; about 70 miles southwest of Portland. The industries are dependent upon the productions of the fertile Willamette valley, in which Dallas is situated. Flour-mills, sash and door factories, saw-mills, woolen factories, and tanneries constitute some of the industries. Sandstone quarries in the vicinity furnish excellent stone. Pop. 2,000.

Dallas, Texas, city county-seat of Dallas County; on Trinity River, and on the Missouri, Kansas & Texas, the Texas & New Orleans, the Gulf, Colorado & Santa Fé, the Texas & Pacific, and the Houston & Texas Central R.R.'s; about 200 miles north by west of Austin, the capital of the State. Dallas is in a fertile agricultural region in which the chief products are cotton, wheat, corn, and fruits.

Manufacturing.— It has extensive lumber interests and its manufacturing establishments are increasing. The principal manufacturing industry is saddlery in which Dallas leads all other places in the United States; cotton gin machinery is also extensively manufactured; other prominent manufactories are flour-mills, brewery, various iron and metal works, cotton gins, grain elevators, lumber-mills, woolen-mills, cottonseed-oil mills, and cotton compressers.

Trade and Commerce.— The wholesale trade of the city embraces all lines of goods, and covers a territory comprising all the States and territories of the southwest, and, in some lines, all of the Southern and Western States. It ranks with Kansas City as first in the distribution of farm machinery and implements. The total wholesale trade in 1903 was $50,000,000, the largest retail trade in the Southwest. Dallas has an extensive mail order business; the postal and express receipts are twice as large as that of any other city in the State.

Municipal Service and Improvements.— The city owns and operates water-works, which cost

about $1,500,000. The present supply of water (1903) is secured by impounding storm waters, but it is to be augmented by artesian water. The chief public structures are the county courthouse, Federal building, city hall, and Carnegie Public Library. There are fine office buildings, stores, and hotels.

Schools, Colleges, and Libraries.— The public free school system embraces 12 white and five colored schools, at which 8,000 pupils attend, two parish schools and seven suburban schools. Other schools are, Saint Mary's Female College (P. E.), Ursuline Academy, Academy of the Sacred Heart, Saint Mathew's Grammar School, Southwestern University (Med. Dep.), Baylor University (Med. Dep.), Physio-Medical, Dallas Medical, Patton Female Seminary, Landon Conservatory of Music; several business colleges and special and private schools. The Carnegie Public Library cost $50,000.

Churches and Charities.— Dallas is the see of the Roman Catholic and the Protestant Episcopal dioceses, and the official home of a bishop of the Methodist Episcopal Church (South). The number of church edifices are Baptist, 12; Catholic, 7; Christian, 6; Congregational, 4; Episcopal, 6; Evangelical, 3; Methodist, 12; Hebrew, 3; Presbyterian, 10; Christian Science, Seventh Day Adventist, and Unitarian, one each; colored churches of various denominations, 20. The State headquarters of the Salvation Army are located here. The charity institutions are: Buckner's Orphans' Home, Saint Mathew's Home for Aged Women, Women's Home, Parkland Hospital (Pub.), Saint Paul's Sanitarium (R. C.), Cunningham Mission Home, Fowler Orphans' Home, Saint Joseph's Orphanage (R. C.), Dallas Free Kindergarten and Settlement Home, United Charities, and several smaller organizations and institutions.

Finance and Banking.— The city has five National banks (one of which is being organized, November 1903), with capital and surplus amounting to $2,418,000; deposits, $10,827,324; one private bank; one trust company, capital $500,000; and 13 savings and loan companies. The National banks are designated as reserve depositories.

Parks and Cemeteries.— The parks are well laid out and most attractive. They are the City Park, Oak Lawn, Exall's, Oak Cliff, Spann's, and Zang's. The cemeteries are Greenwood, Oaklawn, Evergreen, Oak Cliff, the Hebrew, the Catholic, the Orthodox Jews', Odd Fellows', Masons', and two for the colored people.

Government.— The government is vested in a mayor and 12 aldermen, chosen biennially by the people, and a police commissioner and a fire commissioner, appointed biennially by the governor of Texas.

Growth and Population.— Since 1900, the last Federal Census, the area of the city has been extended from seven and one half to nine square miles. Pop. (1890) 38,067; (1900) 42,638; including recent addition, the population in 1900 was 46,268. Pop. 1903, est. 65,000. (The Dallas city directory estimates the population as 75,415.)

THOMAS FINTY, JR.,
'*Dallas Morning News.*'

Dalles, The, or **Dalles City,** Ore., county seat of Wasco County; on the Oregon Railroad. It is about 30 miles northeast of Mount Hood, and on that portion of the Columbia River (on the Washington State boundary line) where the scenery is noted for grandeur. It is situated in a sheep and cattle-raising country, hence its trade is largely in cattle and wool. Fruits grow here in the Columbia Valley. Its chief industries are flour and grist milling, and wool scouring. A military post at Fort Dalles was established in 1838, and about the same time a mission was opened by the Methodist Church. The railroad station is known by the name of Dalles, and the local name often used is Dalles City; but the name of the post-office is The Dalles. Pop. (1900) 3,542.

Dallin, Cyrus Edwin, American sculptor: b. Springville, Utah, 22 Nov. 1861. He studied at the Ecole des Beaux Arts, and the Julian Academy, Paris, and has since practised his art in Boston, where he is instructor in sculpture in the Massachusetts State Normal Art School. He is a member of various art societies and among medals received by him are the gold medal of the American Arts Association in 1888, and the first-class medal of the World's Columbian Exposition at Chicago, 1893. Among his most important works are the 'Pioneer Monument,' and the 'Angel' for the Temple, both at Salt Lake City; 'Sir Isaac Newton' in the Congressional Library; the 'Medicine Man,' Fairmount Park, Philadelphia; 'The Signal of Peace,' Lincoln Park, Chicago.

Dallinger, Frederick William, American lawyer: b. Cambridge, Mass., 2 Oct. 1871. He was graduated from Harvard 1893, and the Harvard Law School in 1897, and was admitted to the Suffolk bar in 1897. He was a member of the lower House of the State legislature in 1894, and of the State Senate 1896–9. He has published: 'Voters' Pocket Manual' (with Pryor) (1892); 'Manual of Civil Government for Use in Public Schools' (1893); 'Nominations for Elective Office in the United States' (1896).

Dallinger, William Henry, English scientist and clergyman: b. Devonport, England, 5 July 1842. He entered the Wesleyan ministry in 1861 and after being minister at Liverpool 12 years was governor of Wesley College, Sheffield, 1880–8. His microscopical researches began in 1870. He became Fellow of the Royal Society in 1880, has been Rede lecturer to the University of Cambridge, lecturer at Oxford and at the Royal Institution, and was president of the Royal Microscopical Society 1883–7. He has published 'Minute Forms of Life' (1886); 'The Origin of Life' (1878); 'The Creator and What we may Know of the Method of Creation' (1887); revision of Carpenter's 'The Microscope and its Revelations' (1891).

Dalma'tia, a province of Austria, and the most southern crownland of the Austrian dominions. It consists of a long, narrow, triangular tract of mountainous country, and a number of large islands, along the northeast coast of the Adriatic Sea. In breadth it is very limited, not exceeding 40 miles in any part. The surface is much varied: a ridge of limestone mountains separates the north portion from

Bosnia, and another runs nearly parallel with the coast, sterile, and destitute of soil. The highest peak is Orien, 6,225 feet. The waters of many of the Dalmatian streams have a petrifying quality, and cover the rocks over which they flow with a coarse stalagmitic deposit. The country is not rich in metals, although in ancient times it is said to have produced gold. In mineral wealth Dalmatia is the poorest of the Austrian provinces, but some brown coal and asphalt are obtained, also manganese ore and salt. Most of the islands are mountainous, and present the same general aspect as continental Dalmatia, but are valuable for their productions, such as timber, wine, oil, cheese, honey, salt, and asphalt; and in several of them ship-building is carried on to a considerable extent. In summer the prevalent wind on the coast is the mistral, or northwest wind, which moderates the excessive heat of the season. The climate of Dalmatia, generally, is warmer than in any other part of the Austrian dominions.

Agriculture is in an extremely backward state, but it is said to have shown considerable improvement of late. The principal agricultural productions are maize, rye, barley, figs, olives, and vines; but sufficient grain is not produced to supply the wants of the country. Dalmatia has hardly any manufactures worthy of the name. A kind of coarse cloth used by the peasants is made. The production of silk has been introduced, and the soil is well suited to the growth of the mulberry-tree. There is a considerable manufacture of liqueurs at Zara, the principal of which is the far-famed maraschino.

The Dalmatians of the coast, and the principal families in the large towns of the interior, are mostly of Venetian extraction; and those who are of Hungarian origin have adopted the customs and language of the Italians. The latter is spoken in all the seaports; but the language of the country is a dialect of the Slavonic, which alone is used by the peasants in the interior. The Dalmatians are a tall, muscular, and vigorous race, generally hospitable, but lazy, vindictive, and dissipated.

The majority of the inhabitants are Roman Catholics, but there are also a considerable number of Greek Catholics. Education is generally diffused by the system of national schools, but it is of a very elementary character. Principal towns — Zara the capital, Spalatro, and Ragusa. Dalmatia was conquered by the Romans in the time of Augustus. In the 7th century it was taken by the Slavs, who founded there a kingdom that lasted till 1050, when the greater part of it was united to Hungary, and the remainder passed under the protection of Venice. In 1797 the Venetian portion, along with the city of Venice, was ceded to Austria; but in 1805, by the treaty of Pressburg, it fell into the hands of Napoleon, who first united it to the kingdom of Italy, and subsequently in 1810, to the kingdom of Illyria. The events of 1814 brought Dalmatia again under Austrian rule. A partial insurrection broke out against the government in October 1869, but was suppressed in the February of the following year. Dalmatia has a diet of its own of 43 members; and it sends 11 deputies to the Austrian House of Representatives. Pop. 593,784.

Dalmatian Dog. See COACH-DOG.

Dalmat'ic (*Dalmatica*), an ecclesiastical vestment, open at each side below the insertion of the sleeves, which are wide. It is the principal vestment worn by the deacon in the Roman Catholic Church when ministering at the Mass, or in processions and in other functions. It is also worn under the chasuble, by bishops, when they celebrate the Mass pontifically; and it is a part of the vesture of a king both in England and in continental European countries. It is commonly of silk; its color varies according to directions of the ritual. The dalmatic was originally a long under-garment of white Dalmatian wool, but little different from the Roman tunic, and not till the fourth century was it a distinctively ecclesiastical garment. At first it was worn only by the Roman deacons, but later its use extended throughout the whole Church. So, too, the use of the dalmatic as part of the solemn attire of bishops was at first restricted to the Pope, but afterward was conceded to all bishops. In the Greek Church a vestment answering to the dalmatic, called stoicharion, is worn by deacons in solemn functions, and in the same Church the celebrating priest wears the stoicharion under the chasuble; but in this case the garment is always white. The two stripes, usually on the dalmatic, were originally purple, that is, a shade near scarlet, and were probably a survival of the *latus clavus* of the tunic of senators.

Dalny, dăl'y-nĭ, Russia, city and free port 20 miles north of Port Arthur; at the east terminus of the Siberian Railway; connected with Saint Petersburg by the Central Manchurian Railway. It was established expressly for a commercial seaport by an edict of the czar of Russia, dated 30 July 1899. It was thrown open to the commerce of all nations 1 Dec. 1901. Dalny is situated on the Liao-tung Peninsula, which extends south into the Gulf of Pechili, China.

The harbor, in which vessels drawing 30 feet can enter at low water, is one of the finest and deepest on the Pacific. The surface of the bay is sufficient for all the shipping of China. Great piers are being built of blocks of stone and cement which weigh from 20 to 50 tons each. Seven railroad tracks and nine large warehouses are being constructed on the piers. A large break-water is being made across the pier harbors, which will allow ships to lie at the piers, and regardless of weather to load or unload.

The port will have no custom-house, but will be absolutely free, not even the small rates of Chinese customs being charged on goods being imported or exported. For the encouragement and development of commerce only the lowest possible rates will be required for tonnage, and the use of docks, wharves, and warehouses. The policy of low charges, the easy access to the harbor during all seasons of the year, the small labor needed to transfer goods from the ocean steamers to the cars, and the cheap coolie service will combine to make this the most economical shipping port in the Occident. The rules governing the city were approved by the emperor of Russia 16 Aug. 1899. The Chinese Railway Company is to build the city under the direction of the Russian minister of finance. Pop. (1903) 41,260. See MANCHURIA.

Dalrymple, dăl-rĭm'pl, **Alexander,** Scottish hydrographer: b. Hailes, near Edinburgh, 24 July 1737; d. London 19 June 1808. In 1752 he went to India in the service of the East India Company, and while there made hydrography his

particular study. In 1795 he obtained the appointment of hydrographer to the Admiralty, as well as to the East India Company. His most important publications are: 'Discoveries in the South Pacific Ocean'; 'A Collection of South Sea Voyages'; 'A Relation of Expeditions from Fort Marlborough to the Islands of the West Coast of Sumatra'; 'A Collection of Voyages in the South Atlantic Ocean'; 'A Memoir of a Map of the Land Round the North Pole'; 'Journal of the Expeditions to the North of California'; 'The Oriental Repertory.' He was also the author of many historical and political tracts.

Dalrymple, Sir **David,** Lord Hailes, Scottish lawyer and antiquary: b. Edinburgh 27 Oct. 1726; d. 29 Nov. 1792. In 1766 he was made lord of session with the title of Lord Hailes, and later a lord of judiciary. He published 'Annals of Scotland' (1786), and other works on Scottish history, both ecclesiastical and political, antiquities, etc.

Dalrymple, James, 1st Viscount Stair, Scottish lawyer and statesman, b. Carrick, Ayrshire, May, 1619; d. Edinburgh 25 Nov. 1695. In the civil war he sided with Parliament, but soon relinquished that party, and became professor of philosophy at Glasgow. He then adopted law as a profession, and in 1670 was made president of the Court of Sessions. He was adverse to the severe measures adopted against the Covenanters, and having excited the enmity of the Duke of York, lost his appointments, and retired to Holland in 1682. Here he became a favorite with the Prince of Orange, who, after the revolution, created him Viscount Stair. Stair wrote: 'The Institutes of the Laws of Scotland' (still a standard authority); 'Philosophia nova experimentalis'; 'Vindication of the Divine Perfections'; 'An Apology for his Own Conduct'; etc.

Dalrymple, John, 1st Earl of Stair, Scottish statesman: b. 1648; d. 8 Jan. 1707. He was son of James Dalrymple (q.v.). He was called to the Scottish bar in 1672, and his eloquence and ability soon gained him a leading place in his profession, as later in the Scottish Parliament. Under Charles II. he suffered imprisonment twice for not sufficiently enforcing the persecuting acts, but held office in Scotland under James. He was largely instrumental in carrying out the 1688 revolution in Scotland, and for some time acted as the king's representative in that country, but his undoubted services have been somewhat discounted by his connection with the massacre of Glencoe in 1692. He assisted largely in bringing about the union between England and Scotland. He succeeded his father as viscount in 1695, and in 1703 was created earl.

Dalrymple, John, 2d Earl of Stair, Scottish general; b. Edinburgh 20 July 1673; d. there 9 May 1747. He entered the Cameronian Regiment in 1692, and in 1701 was appointed lieutenant-colonel of the Scots regiment of foot guards. In 1707 he succeeded to the earldom and became one of the Scottish representative peers, but still continued his military life, and distinguished himself in the campaigns of Marlborough, and more particularly at the battles of Oudenarde, Malplaquet, and Ramillies. On the accession of George I. he was appointed a privy councilor, and went on a diplomatic mission to France, where he attracted much notice by the splendor of his retinue, and also displayed great skill and address. He returned in 1720, and for the next 20 years he took an active interest in agricultural pursuits. In 1742, on the dissolution of Walpole's administration, he again entered public life, and continued to act in different capacities, civil and military, till his death.

Dalsgaard, Christen, krĭs'tĕn dăls'gärd, Danish artist: b. Krabbesholm, Jutland, 30 Oct. 1824. He studied at the Copenhagen Academy. Among his paintings, which deal mostly with Danish peasant life, are: 'Christmas Morning'; 'Jutland Peasants going to Communion'; 'Fisherman and Daughter'; 'Seizure for Debt'; 'One of the Wise Virgins'; 'Ansgar and Odbert Baptizing Mother and Child.'

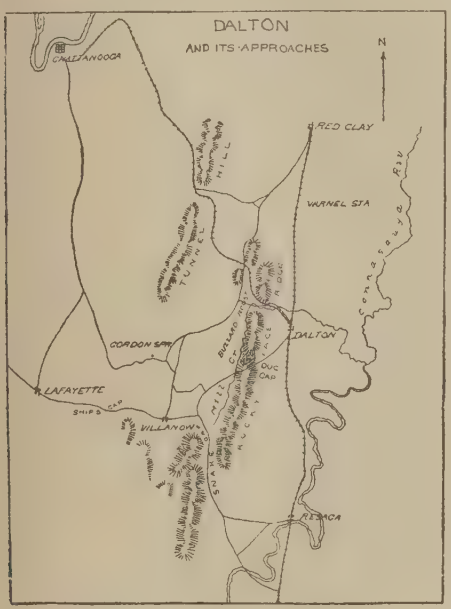
Dalton, John, English chemist and physicist: b. Eaglesfield, near Cockermouth, Cumberland, 6 Sept. 1766; d. Manchester 27 July 1844. He was mainly self-educated, and showed such a decided turn for mathematics that he obtained the position of professor of mathematics and natural philosophy in New College, Mosley Street, Manchester, in 1793. The same year he published his early meteorological observations and essays. In 1799, on the removal of New College to York, he resigned his chair, but continued to give private lessons in the same branches. In 1808 he commenced the publication of his 'New System of Chemical Philosophy,' which, containing his brilliant discovery of the atomic theory, produced an important revolution in the science, gave him a very high place among philosophical chemists, and spread his fame over Europe. The Royal Society of London in 1826 admitted him a member, and unanimously awarded to him the first of two gold medals intended for those who had made the greatest discoveries in science. He was also elected member of the Institute of France, of the Royal Academies of Science of Berlin and Munich, and of the Natural History Society of Moscow. See 'Life,' by Lonsdale (1874); Roscoe and Harden, 'New View of the Origin of Dalton's Atomic Theory' (1896.)

Dalton, John Call, American physiologist: b. Chelmsford, Mass., 2 Feb. 1825; d. New York 11 Feb. 1889. He was graduated at Harvard in 1844 and at Harvard Medical School in 1847. He was successively professor of physiology at the University of Buffalo, at the Vermont Medical School, at the Long Island College Hospital, and at the New York College of Physicians and Surgeons. He served as an army surgeon throughout the Civil War. His published works include: 'Human Physiology' (1859); 'Physiology and Hygiene for Schools, Families and Colleges' (1868); 'The Experimental Method of Medicine' (1882); 'Topographical Anatomy of the Brain' (1885).

Dalton, Ga., city and county-seat of Whitfield County; on the Southern and the Nashville, Chattanooga & Saint Louis railroads; 100 miles northwest of Atlanta. It is a health resort, and the seat of Dalton Female College. It has canning factories, cotton compresses, flour-mills, foundries and machine shops, public schools, weekly newspapers, and a national bank. Pop. 4,315.

Dalton, Ga., Military Operations at (23–25 Feb. 1864, and 8–12 May 1864, including engagements at Buzzard's Roost Gap, Dug Gap,

Rocky Face Ridge, and Varnell Station). Dalton is in the northwestern part of Georgia, where the Chattanooga and Atlanta R.R. is intersected by that from Cleveland, Tenn. By rail it is 38 miles southeast of Chattanooga. When Gen. Bragg was supposed definitely to have abandoned Chattanooga, 9 Sept. 1863, Gen. Halleck ordered Gen. Rosecrans to occupy Dalton, and there Bragg retreated after his defeat at Lookout Mountain and Missionary Ridge, 24–25 Nov. 1863. In February 1864 Gen. Grant ordered Gen. Thomas to seize the town. Thomas moved, reported that he could not carry the position, and the effort was abandoned. His movement cost the Union army about 300 killed and wounded, and the Confederates about 200.



Dalton, the first objective point of Sherman's Atlanta campaign, was held 30 April 1864, by Gen. J. E. Johnston, with 54,400 men. The approaches to the place were difficult, and it was practically impregnable. Early in May Sherman concentrated his grand army in and around Chattanooga for his Atlanta campaign. It was made up of the armies of the Cumberland, Tennessee, and Ohio, commanded respectively by Gens. Geo. H. Thomas, J. B. McPherson, and J. M. Schofield, aggregating 98,797 men and 254 guns. The Army of the Cumberland had about 60,000 men, the Army of the Tennessee 25,000, and the Army of the Ohio, 14,000. On 6 May the Army of the Cumberland was at and near Ringgold, the army of the Tennessee at Gordon's Mill, on the Chickamauga, and the Army of the Ohio near Red Clay, on the Georgia line, north of Dalton. The four corps of Thomas and Schofield were ordered to move on Dalton in front, while McPherson with two corps moved through Snake Creek Gap. On the 7th McPherson was ordered to march from Gordon's Mills through the Gap to Resaca, 18 miles south of Dalton. He marched by way of Ship's Gap and Villanow, pushed through Snake Creek Gap, a wild defile, nearly six miles long, 15 miles south of Buzzard's Roost, and on the morning of the 9th drove back Grigsby's Kentucky cavalry brigade, and marched to within a mile of Resaca, then held by two brigades under Gen. Cantey. Finding the place too strong to be assaulted, McPherson fell back to a strong position at the east end of the Gap. Meanwhile Thomas and Schofield had pressed forward. Thomas drove the Confederates in his front full through Buzzard's Roost Gap, and Schofield closed down on Thomas' left. On the 8th there was heavy skirmishing between Thomas and the Confederate divisions of Stewart and Bate at Buzzard's Roost, and about six miles farther south a determined assault.

The road from Lafayette to Dalton passes through a cleft in the palisade, which had been deepened and widened, hence known as Dug Gap. Geary's division attacked this gap. Skirmishers were thrown out who drove those of the enemy from the foot of the ridge and up the road nearly to the summit, when two brigades were formed in double lines on either side of the road. The Confederates were driven clear to the summit. The position of the Gap could not be carried, and an assault on the perpendicular palisade south of it was ordered, where it was broken by a few clefts through which four or five men could move abreast. The men charged, a few reached the summit, to be killed or captured, and the assault failed. After a short breathing-spell another effort was repulsed with much loss. Still another attempt was made by a single regiment, but it also failed. Everywhere the assault was repulsed, and the Federals withdrew after a loss of 306 killed and wounded, and 51 captured or missing. It is doubtful if the Confederate loss exceeded 30 men. At Varnell's Station Stoneman's and Wheeler's cavalry divisions had an engagement in which the loss was about 150 on each side, and Thomas pressed so vigorously in front of Buzzard's Roost that the heavy skirmishing attained the dimensions of a battle. By the 11th Sherman moved his army to pass through Snake Creek Gap. On the evening of the 12th Johnston was fully informed of the movement toward his rear, which had been covered by the ridge and the forests of the country, and he abandoned his position that night to give Sherman battle at Resaca. On the morning of the 13th Howard occupied Dalton. The Union loss around Dalton, 7–12 May, was about 830 killed and wounded; the Confederate loss not more than half that number. Consult: 'Official Records,' Vol. XXXVIII.; Van Horne, 'History of the Army of the Cumberland,' Vol. II.; Johnston, 'Narrative,' Sherman, 'Memoirs,' Vol. II.; Cox, 'Atlanta'; the Century Company's 'Battles and Leaders of the Civil War,' Vol. IV.

E. A. Carman.

Dalton-in-Furness, England, town in Lancashire, and 30 miles northwest of Lancaster by the Furness Railway. In its vicinity are extensive iron works, rich hematite iron-ore mines, and the ruins of the magnificent abbey of Furness. Dalton Castle, an old tower in the town, was formerly associated with Furness Abbey. The painter Romney was born and buried here. It is connected with the Irish Sea by a canal three miles long. Pop. (1901) 13,020.

Daltonism. See Color Blindness.

Dalton's Law. See PNEUMATICS.

D'Alviella, däl-vē-ĕl-lä, **COUNT Goblet,** gōb-lā, Belgian savant: b. Brussels 10 Aug. 1846. He was educated at Brussels and Paris and in 1879 married a Miss Packard of Albany, N. Y. He is a member of the Royal Academy of Belgium and of the Royal Asiatic Society of Great Britain. He was for some time director of the 'Revue de Belgique,' was Hibbert lecturer at Oxford University in 1891, and has published 'Sahara and Lapland' (1874); 'Inde et Himalaya' (1877); 'Contemporary Evolution of Religious Thought in England, America and India' (1885); Hibbert Lectures on 'Origin and Growth of the Conception of God' (1892); 'The Migration of Symbols' (1894); 'Ce que l'Inde doit à la Grèce' (1897); and other works in French.

Daly, Charles Patrick, American jurist and author: b. New York, 31 Oct. 1816; d. 19 Sept. 1899. He had a distinguished judicial career in his native city, becoming justice of the court of common pleas in 1844, first judge of the court in 1857, and chief justice in 1871, retiring on account of age in 1886. He was president of the American Geographical Society for many years prior to his death. His works include: 'First Settlement of Jews in North America'; 'What We Know of Maps and Map Drawing Before Mercator,' and similar investigations.

Daly, John Augustin, American dramatist and theatrical proprietor: b. Plymouth, N. C., 20 July 1838; d. Paris 7 June 1899. In 1869 he opened his Fifth Avenue Theatre in 24th Street, New York; and after its destruction by fire in 1873 he opened its successor in 28th Street. In 1879 he opened Daly's Theatre in Broadway. Among his original plays are 'Divorce'; 'Pique'; 'Horizon'; 'Under the Gaslight.' He also wrote: 'Peg Woffington, a Tribute to the Actress and the Woman.'

Daly, Joseph Francis, American lawyer: b. Plymouth, N. C., 3 Dec. 1840. He was educated in New York, studied law and was admitted to the bar there in 1862. He was judge of the court of common pleas, 1870–96, and chief justice of the same 1890–6. He was also justice of the Supreme Court 1896–8. He was one of the founders of the Players' Club in New York and was president of the Catholic Club 1894–9.

Dalyell, or **Dalzell, Thomas,** Scottish soldier: b. about 1599; d. 23 Aug. 1685. He was taken prisoner fighting on the royalist side at Worcester, and afterward escaped to Russia, where he was made a general. Returning to England at the Restoration, he was made commander-in-chief of the forces in Scotland, and made himself notorious for his ferocity against the Covenanters.

Dalzell, John, American lawyer: b. New York 19 April 1845. He removed with his parents to Pittsburg in 1847, was educated at Yale and after studying law was admitted to the bar in 1867. He has practised his profession in Pittsburg and has been an attorney for the Pennsylvania Railroad Company for its western lines for many years. He has been a Republican member of Congress from 1887 and served on the Ways and Means Committee in the Fifty-fourth and succeeding Congresses.

Dalziel, Edward, English painter and illustrator: b. Wooler, England, 5 Dec. 1817; d. 25 March 1905. He became associated with his brother George in painting, drawing, and wood engraving, the firm of the Brothers Dalziel having been for half a century well known in relation to illustration of a high character. He has exhibited at the Royal Academy and Royal Institute of Painters in Oil, and with his brother wrote: 'The Brothers Dalziel: a Record of Fifty Years, 1840–1890.'

Dalziel, George, English wood engraver: b. Northumberland 1816; d. Hampstead 7 Aug. 1902. He was a brother of Edward Dalziel (q.v.) He established himself in London where he was joined by his two brothers, and the firm soon became famous for the excellence of its illustrated works, the best artists in England being engaged to draw blocks for their use.

Dama, dā'ma, a genus of the deer family (*Cervidæ*), comprising the common fallow deer (*Dama vulgaris*) and the Persian fallow deer (*D. mesopotamica*). The name is also given to a species of large gazelle (*Gazella dama*) found in the Sudan. It is allied to the mohr (q.v.), but with relatively shorter lyrate horns and no dark stripe on the flanks. Closely allied to it also is the aoul (q.v.) of Somaliland.

Dam'ages, the indemnity recoverable by a person who has sustained an injury, either in his person, property, or relative rights, through the act or default of another; also, the sum claimed as such indemnity by a plaintiff in his complaint. Compensatory damages are damages allowed as a recompense for the injury actually received. Consequential damages are those which though directly, are not immediately consequential upon the act or default complained of. Exemplary, vindictive or punitive damages are, in legal contemplation, synonymous terms. Exemplary damages would seem to mean such damages as would be a good round compensation, and an adequate remedy for the injury sustained, and such as might serve for a wholesome example to others in like cases.

Where injuries are maliciously, wantonly, or recklessly inflicted, the right of the jury to award punitive damages is said to be as old as the right of trial by jury itself, and is not, as some seem to suppose, an innovation upon the rules of the common law. In England as early as 1763, it was declared that the jury had done right in giving punitive damages. (Hackle *v.* Money, 2 Wils. 205). And now, both in England and in the United States, the doctrine of punitive damages seems to be well settled, and the right of the jury to give such damages in a proper case cannot be shaken in any of the States by anything short of legislative enactments.

General damages are those which necessarily and by implication of law result from the default or act complained of. Special damages are such as arise directly, but not necessarily, from the wrongful act or default complained of. Parties entering into an agreement may estimate beforehand the amount of damages to result from a breach of the agreement, and may prescribe in the agreement itself the sum to be paid by either of the parties to the other by way of damages for such breach. Such damages are called liquidated damages, when sanctioned by the law. If, however, the agreement is such that the law

refuses to adopt it, then the damages agreed upon will be regarded as a penalty, or as in the nature of a penalty. General damages need not be alleged in the complaint of the person injured, nor is it necessary that any specific proof of damages be given to entitle the party injured to recover. The legal presumption of injury in cases where it arises is sufficient to maintain the action. Whether special damage be the gist of the action, or only collateral to it, it must be particularly stated in the complaint, as the plaintiff will not be permitted otherwise to go into evidence of it at the trial, because the defendant cannot also be prepared to answer it.

To constitute a right to recover damages, the party claiming damages must have sustained a loss; the party against whom they are claimed must be chargeable with a wrong; the loss must be the natural and proximate cause of the wrong. Where there is no loss there is no right to damages, properly so called. A sum in which the wrong-doer is mulcted simply as a punishment for his wrong, and irrespective of any loss caused thereby, is a "fine" or a "penalty," rather than damages. Damages are based on the idea of a loss to be compensated, a damage to be made good. It is not necessary, however, that this loss should always be distinct and definite, capable of exact description, or of measurement in money. A sufficient loss may appear, from the case itself, to sustain an action. A sufficient loss to sustain an action may appear from the mere nature of the case itself. The law in many cases presumes a loss where a wilful wrong is proved; and thus damages are also awarded for injured feelings, bodily pain, grief of mind, injury to reputation, and for other sufferings which cannot be made the subjects of exact proof and computation in respect to the amount of loss sustained.

Daman, dä-män', or **Damão,** India, a seaport town in Hindustan, at the mouth of the Gulf of Cambay, on the Damanganga or river of Daman, 100 miles north from Bombay. It belongs to the Portuguese, who sacked it in 1531, retook it in 1558, and have kept possession of it ever since. It carries on some cotton-weaving, fishing, ship-building and several salt works. Pop. about 6,000. The Portuguese district here of the same name possesses valuable teak forests. It has an area of 148 square miles. Pop. about 64,000.

Daman, dä'man, the Syrian name for the coney of Scripture. See CONEY; HYRAX.

Damanhur, dä-män-hoor', Egypt, town of Lower Egypt, capital of the province of Beharah, an important railway centre and seat of cotton manufacture. Pop. (1897) 27,236.

Damaraland, dä-mä'rä-länd, a district of German Southwest Africa, bounded on the west by the Atlantic Ocean. It is mountainous, some of the peaks ranging in height from low hills to elevations of over 8,000 feet. In some parts there are broad prairies, which could afford pasturage for thousands of cattle. In the mountains have been found rich deposits of copper. The produce of the interior consists of ivory, feathers, skins, etc. The Damaras, properly Herero, a Bantu stem, number about 80,000, of whom 50,000 live in the mountain district; they are nomads, and own large flocks and herds. The Hawkoin, or Hill Damaras, in the northeast, however, who are a much lower type, now speak Hottentot. The only harbor in this part of the coast is Walfisch Bay, which properly belongs to Nama Land; it was annexed to Cape Colony in 1884. In the same year the desert region along the coast was made a German protectorate.

Damascene, dăm'ạ-sēn, **St. John** (JOANNES DAMASCENUS, JOHN OF DAMASCUS), a monk and an illustrious theologian of the Greek Church in the 8th century, native of Damascus, b. about 700; d. about 755. He was the first to reduce to system the Church's dogmas and to classify the decrees of the General Councils concerning matters of faith; this he does in the third part of his work: 'The Fountain of Knowledge.' In the first part, 'Points of Philosophy,' he makes application to theology of the principles of Aristotle's *Dialectica;* the second part consists of a reproduction of Epiphanius' work: 'On Heresies,' with additional notices of heresies condemned by the Church after Epiphanius' time; the third and most valuable part is the 'Precise Exposition of the Orthodox Belief.' In mediæval times the 'Precise Exposition,' translated into Latin in the 12th century, gave direction to the theological views and speculations of the schoolmen; and hence Damascenus has been denominated the "Father of Scholasticism." Many other treatises are extant which bear his name as author, but of most of these the authenticity is doubtful. No contemporary account of his life has come down to us; the earliest biographical notice of him that we have dates from the 10th century, and that is unworthy of credit. The epithet: "Chrysorrhoas," that is, gold-streaming, bestowed upon him in his lifetime, testifies to his reputation for eloquence. He is recognized as a saint both in the Greek and the Latin Church.

Damascius, dạ-măsh'ĭ-ŭs, a philosopher, so called from his supposed native place Damascus, lived in the beginning of the 6th century. He is known as one of the most distinguished teachers of the Neoplatonic philosophy. In Alexandria he studied rhetoric under Theon and mathematics under Ammonius; and afterward in Athens his teachers were Zenodotus and Marinus, the successors of the more celebrated Proclus. Numerous fragments of his writings remain, one of which is entitled: 'Doubts and Solutions respecting the First Principles.' It is so mystical as to be almost unintelligible, but it is important to the history of philosophy from its frequent notices of earlier philosophers.

Damas'cus (native name DIMISHK-ES-SHĀM, Syria), a celebrated city, capital of the Turkish vilayet of Syria, finely situated on a plain, at the eastern base of the Anti-Libanus range, supposed to be the most ancient city in the world. It is six miles in circumference, and is surrounded by a dilapidated wall. The plain on which the city stands is of great extent, and is covered with the most beautiful gardens and orchards, irrigated by the waters of the Barrada, forming a grove of more than 50 miles in circuit, rich in fruits, including oranges, lemons, citrons, pomegranates, mulberries, figs, plums, walnuts, pears, and apples. The interior of Damascus by no means corresponds with the beauty of its environs. The streets are narrow and crooked, paved with basalt, and have a gloomy and dilapidated appearance; they are generally in three divisions —

that in the middle devoted to cattle and riders being the lowest, and of the same width as the other two. In most parts of the city the fronts of the houses are built with mud, and pierced by a very few small grated windows, with red painted shutters. They are low, with flat-arched doors, resembling those of stables, while a dung-hill and pool of putrid water almost invariably stand before each door. In many of them, however, a singular contrast is presented between the dull, prison-like outer walls of gray mud and the richness within. Interiorly they are of a quadrangular form, enclosing a court paved with marble, ornamented with beautiful trees and flowering bushes, and having copious fountains playing in the centre. The lower rooms on each side of the court are raised above its area, and open in front — their roofs and walls highly ornamented with figures of flowers and inscriptions, and a variety of arabesque devices. The furniture, also, is of the most splendid description. The best and wealthiest part of the city is the Moslem quarter, where the streets are wider and cleaner, the houses higher and better built, and the supply of water much more abundant than in any other part of the town. The Christian and Jewish quarters are the most miserable.

Among the places most worthy of notice in Damascus are the bazaars. They are merely long streets — the principal one about one and a half miles in length — covered in with high wood-work, and lined with shops, stalls, stores, and cafés. The shops are narrow, and go only a short way back. There is a separate bazaar for almost every commodity exposed to sale, and all of them are patrolled by multitudes of confectioners and dealers in ices and cooled sherbets. In the midst of the bazaars stands the Great Khan, said to be one of the most magnificent structures of its kind. It is an immense cupola, supported on granite pillars, and built, in part, of alternate layers of black and white marble. Its gate is one of the finest specimens of Moorish architecture to be seen in the world. In this building, and in 30 inferior khans, purchases and sales are daily conducted by the merchants, who have their counting-houses near them. The principal mosque, a fine edifice, was destroyed by fire 14 Oct. 1893. There are three Latin monasteries in Damascus — those of the Franciscans, Capuchins, and Lazarists. The principal Roman Catholic churches form part of the monastic buildings; there are, besides, a number of detached churches belonging to different sects in various parts of the city. Besides the more remarkable architectural objects mentioned, there are an extensive citadel, and a serai or palace, in which the pasha resides. The most interesting locality in the city is, perhaps, what is called "Straight Street," mentioned in connection with the conversion of the apostle Paul. It is the most important, largest and busiest street in Damascus; is about one mile in length, and runs from east to west. The house of Judas, also, to which Ananias went, is still pointed out, as well as that of Ananias.

Damascus was formerly a great emporium of trade between Europe and the East, and still imports English cottons and other goods to the yearly value of about $2,590,000. It is also a place of considerable manufacturing industry. There are a number of manufactories of silk, damasks, cotton, and other fabrics; numerous cotton-printing and dyeing establishments, tobacco factories, copper and iron foundries, and glass works. The manufacture of Damascus blades, for which the city was once so celebrated, no longer exists. Saddles and bridles, rich and highly finished, fine cabinet work, and elegant jewelry, are among the manufactures of Damascus. It is one of the holy cities, and here the pilgrims assemble on their journey to, and separate on their return from Mecca. Until a very recent period no Christian could walk the streets without incurring the risk of being insulted, and probably maltreated, by its fanatical population; and no farther back than the year 1860 a considerable number of Christians were massacred by the bigoted Moslems. This intense hatred of the Frank, however, is now considerably abated.

Damascus to-day is perhaps the most thoroughly Oriental in all its features and characteristics of any city in existence. Of its origin nothing certain is known. There is, however, abundant evidence of its great antiquity, as it is mentioned in Gen. xiv. 15, as existing 1913 B.C., and appears even then to have been a place of note. At subsequent periods it fell successively under the power of the Israelites under David, the Persians, Greeks, and Romans, attaining great eminence under the last. In 1516 it fell into the hands of the Turks. A Protestant mission and schools have long been in operation here. Beirout is the seaport of Damascus, and is reached by a road 70 miles long. A railroad has been constructed from Beirout, and one from Damascus to the Hauran. Gas and street cars have recently been introduced. Pop. (estimated for 1898) 225,000, of whom perhaps 25,000 are Christians.

Damascus Blades, swords or scimitars formerly made chiefly at Damascus. These famous weapons, though in use among nations little skilled in the metallurgic arts, long before the Christian era, and made familiar to the European nations from the time of the crusades, long defied all attempts at imitation. It appears that the Indian wootz was in ancient times carried from the region of Golconda in Hindustan (where, as well as in Persia, it still continues to be manufactured by the original rude process), and at Damascus was converted into weapons. These were particularly distinguished for their keen edge, capable of severing heavy iron spears or cutting the most delicate gossamer fabric floating in the air; and for the peculiar watered appearance of the steel, which was covered with delicate black, white, and silvery veins, parallel to each other or interlaced. The Damascus appearance may be given to iron by welding together bars of different degrees of hardness, drawing them down, and repeating the process several times. (See DAMASCUS IRON.) Karsten suggests that by the use of bars of good steel the best Oriental blades may have been fashioned in this way. The "mosaic" process differed from the other by cutting the bar into short lengths and fagoting these pieces, the cut surfaces always being placed so as to face outward. Blades of great excellence were thus produced, but still inferior to the genuine Damascus. It was not till after the investigations of Gen. Anossoff in the first half of the 19th century that successful reproductions were obtained. These researches led to the

establishment of works at Zlatoosk in the Ural Mountains, where Anossoff manufactured Damascus steel by processes of his own invention. According to his best method 11 pounds of iron were melted in the crucible with one twelfth as much graphite and one thirty-second part of scales of iron. All his sword blades were tempered in boiling grease. The process of bringing out the watered appearance was accomplished by the use of a diluted acid, which acts more upon the ground than upon the lines. The Zlatoosk weapons proved to be of properties similar to those of the old Damascus blades. Gen. Anossoff with one of them cut through floating gauze. Bones and nails may be cleft without injury to blades tempered for such use, and other steel tempered to the same point may be nicked by them without causing a gap. Their elasticity is so great that one may put his foot upon the end of the blade and bend it to a right angle, when it will fly back perfectly unchanged. Gen. Anossoff died in 1851, and his successor at the works failed to produce the remarkable blades for which the establishment had become celebrated.

Damascus Iron, or **Damascus Twist**, iron produced by the following method: Twenty-five alternate bars of iron and mild steel, each about 2 feet long, 2 inches wide, and ¼ inch thick are united by welding; the fagot being drawn into a bar ⅜ inch square, is cut into lengths of 5 or 6 feet. One of these pieces is heated to redness, and one end is held firmly in a vice, while the other is twisted by a wrench or tongs, which shortens the rod to half its length and makes it cylindrical. If two of these twisted pieces are to be welded together, they are turned in diverse directions, one to the right and the other to the left; these are laid parallel to each other, welded and flattened. If three rods be used, the outside rods turn in a direction the opposite of the middle one, and this produces the handsomest figure. By these operations the alternations of iron and steel change places at each half revolution of the square rod, composed of 25 laminæ, the external layers winding round the interior ones; thus forming, when flattened into a ribbon, irregular eccentric ovals or circles. The fineness of the Damascus depends upon the number and thickness of the alternations.

Dam'ask, a textile fabric, the ground of which is bright and glossy, with vines, flowers, and figures interwoven. At first it was made only of silk, but afterward of linen and woolen. According to the opinion of some, this kind of weaving was derived from the Babylonians; according to others, invented at a later period by the inhabitants of Damascus, from which latter place it is known to have derived its name. The true damasks are of a single color. In modern times the Italians and Dutch first made damask; and Europe was supplied, as late as the 17th century, from Italy alone, chiefly from Genoa. But the French soon imitated it, and now surpass the Italians. Damask is made in great quantities in Germany, chiefly in Upper Lusatia. Dunfermline is the chief seat of the manufacture of damask linen in Scotland, and Lisburn (q.v.) and Ardoyne in Ireland.

Damask Designing and Manufacture. To trace the origin of the art of weaving, or to ascertain the name of the artisan whose necessities led him to devise the crude appliance capable of being used in the production of even the very coarsest woven material, would be a hopeless task indeed, separated, as we are, from a period so exceedingly remote by the impenetrable gloom and obscurity which must ever enshroud the events of three or four score centuries ago. And yet we are safe in assuming that the ability to produce woven fabrics by means of a loom, no matter how elementary in construction, far antedates all written history, carrying us back to those early ages when the first rays of the sun of progress were faintly discernible above the horizon of time, awakening within our humble ancestors the desire for those things, which when obtained served to lighten their toil, and at the same time form part of the foundations of the noble structure, to which successive generations have contributed their share, and which we call civilization.

Coming down to a later period, however, we are enabled to gather authentic information regarding the degree of progress made in the art of weaving. Trustworthy records dating as far back as 2000 B.C. reveal the fact that the weavers of ancient Egypt were far advanced with the production of plain woven fabrics, many excellently preserved fragments of fine linen, which have been taken from the mummy cases of that period, testifying not only to the reverence with which they regarded the embalmed remains of their illustrious dead, but also to their skill and proficiency as weavers.

In the Bible also we find numerous references to the products of the loom. Job speaks of his days as being swifter than a weaver's shuttle (Job vii. 16). We also read that the draperies of the tabernacle and the veil of the temple were woven fabrics, richly embroidered with various colors. These allusions to the art of weaving, and others too numerous to mention, are scattered profusely throughout the pages of the sacred volume; while heathen writers of antiquity frequently allude to weaving as an art which was held in the highest esteem, and which furnished a favorite occupation for people representing every grade of society, from those who dwelt in the marble halls of princes down to the occupants of the most humble dwellings.

Nor was skill in weaving confined to one locality or people; an art so essential to the comfort and welfare of humanity at large, must speedily have become the common property of widely separated races; consequently we find that the Babylonish weavers of the year 1000 B.C. were celebrated for the richness and quality of their woven fabrics; while at the same period the patient Hindu and the stolid Chinese were producing fabrics of the finest texture on looms of the most primitive description.

From this it is obvious that the ancient races were familiar with the principles of fabric construction, and that they were able to produce a considerable variety of elementary weaves by using different varieties and counts of yarn in combination with each other; yet there is nothing to show that they were acquainted with any form of loom, the mechanism of which made possible the production of intricate floral or ornamental designs, such for example as could easily have been woven on the draw loom of a later period, or by its successor, the highly improved Jacquard power loom of the 20th century. This obvious drawback, however, they endeavored to overcome by means similar to those employed

by modern manufacturers of textiles, who, in order to meet the demand for showy and inexpensive fabrics of a certain description, are accustomed to arrange either the warp or filling in the form of a series of stripes of contrasting colors, harmoniously arranged together or else by changing the color of both warp and filling at such intervals as a previously devised pattern indicates, are enabled to produce an extensive variety of checkered patterns.

Designs of this character the weaver of ancient times found no difficulty in creating, but any large ornate or floral patterns with which he was familiar, were obtained either by printing, or the skill of the embroiderer, or when considered desirable, a combination of both added to the woven material after it had passed from his hands, and which as a result cannot be classed with those fabrics, which, produced entirely on the loom, are valuable on account of the elaborate nature of the designs with which they are embellished, as much as by the costliness of the materials employed in their construction.

It will thus be seen that a loom which could only be used in the production of a comparatively restricted variety of designs was sure to be superseded sooner or later by one of a more highly developed type, which would allow the decorative instinct of the early textile artist greater oportunity to express the ideas suggesting themselves to him.

In due time a loom capable of accomplishing these results was invented, probably in China, where, like so many other relics of the long forgotten past, it may be seen in operation at the present day, although long since consigned to the rubbish heap in all progressive countries.

From China the draw loom, as it came to be called, found its way to other parts of the globe. But it remained for the weavers of the ancient city of Damascus, the capital of Syria, to develop the possibilities of the new loom to the utmost extent, with the result that in time they established a large manufacturing and export trade in the beautiful silken fabric which soon became widely known as damask, taking its name from that of the city to which for centuries it brought wealth and renown, and in the manufacture of which the Damascene excelled all competitors.

In regard to the fabric itself, it and various other weaves, now passing under the same name, will be analyzed and described farther on, but any detailed description of the now thoroughly obsolete draw loom would be out of place and of no value to the average reader, but those desirous of making a thorough study of the subject will find their curiosity gratified by consulting the excellent treatise on hand loom weaving by Murphy, published during the early part of the 19th century.

Stated as briefly as possible, however, it may be said that the draw loom tie-up was a compound arrangement, one part of the harness being controlled by a lad known as the draw-boy, the other part controlled by shafts for the purpose of subdividing the warp, so as to form the fine ground weave peculiar to damask fabrics. Just as the weaver was about to throw the shuttle across the lathe, the warp, of which there may have been five, six, seven, or more ends to each mail, according to the quality of damask desired, was raised *en masse* by the draw-boy in accordance with the requirements of a previously painted pattern, all the remaining warp being left down. The shuttle would thus have passed under the warp raised and over the warp left down without interlacing or forming cloth, had it not been for the supplementary arrangement of harness shafts, through which the entire warp was drawn, for the purpose of enabling every end to be used separately.

For each pick one of these shafts would be raised and one depressed, the others remaining undisturbed, the shaft which had been raised lifting every eighth end from among the mass of warp left down, the shaft which had been depressed carrying down with it every eighth end from the mass of warp raised, while the shafts which remained in a neutral position were so constructed as to permit the lifting of one portion of the warp and the sinking of the remainder as called for by the design, without interfering with the shed or passage of the shuttle. By this means the pattern was formed and the warp and filling interwoven so as to produce an eighth shaft satin or any similar weave required.

During the wars of the Crusades the draw loom, along with many other things Oriental, found its way into various European countries, thereby aiding greatly the development of weaving as applied to silk damask, brocade, velvet, and other fabrics; the great artists of the Middle Ages not considering it beneath their dignity to supply the necessary designs for these rich textiles. For centuries, however, the draw loom remained practically the same as when first introduced, but in the year 1604 a Frenchman named Simblot devised a method by means of which the draw-boy was enabled to raise the warp while standing at the side of the loom, instead of the top, as had been the custom previously.

In England also, during the 17th and 18th centuries, patents were taken out for several devices intended to render the services of the draw-boy unnecessary; these, however, soon passed from public view, but the draw-boy remained, toiling away at his monotonous task for many a day after the mortal remains of Jacquard had crumbled to dust.

In the United States the manufacture of the finer grades of silk and cotton damask and upholstery fabrics in general is of comparatively recent origin, the vast majority of looms devoted to this industry being located in Philadelphia, with lesser numbers scattered throughout New York State, New Jersey, Connecticut, and Virginia.

Twenty-five years ago the business was in its infancy, but "mighty oaks from little acorns grow," and to-day the manufacture of upholstery goods is one of the most important industries of the country, which, with allied trades, such as yarn-spinning, dyeing, and the manufacture of textile machinery, provides the means of livelihood for tens of thousands of operatives, and at the same time is a standing monument to the business enterprise of the American manufacturer. Nor have we by any means reached the limits of our development in this direction; the remarkable inventive ingenuity of the American artisan, which in many other lines of business has practically placed him beyond the reach of competition, will not be likely to fail him when applied to the weaving industry.

Silk Damask Curtain. Designed by William Laird Turner. Exhibited by the Philadelphia Textile School at the Chicago World's Fair. 210 ends per inch. 120 picks per inch. Pattern on design paper covered 174 square feet. 28,320 cards required to form the design on cloth, which placed end to end would extend a distance of 7¾ miles. The largest pattern designed in the United States, up to 1893.

We will now consider the machine which time and experience has clearly demonstrated to be the most valuable contribution to the art of ornamental pattern weaving yet devised, and which owes its usefulness to the ingenuity of Joseph Marie Jacquard (an artisan of Lyons, France, born in the year 1752), although a large share of the honor bestowed on Jacquard is really due several others who endeavored during the early part of the 18th century to improve the draw loom. M. Falcon, for example, in the year 1728 invented a method of raising the warp by means of a chain of cards, on which a pattern was represented by holes perforated thereon, the cards being adjusted to a square cylinder also perforated to match a fully punched card. M. Vaucanson is also entitled to credit for improving the cylinder and causing it to revolve and move backward and forward with the cards. He also invented the griffe, which had for its object the raising of the warp; but these inventions, although constituting the essential features of the Jacquard machine, never passed beyond the realm of experiment until about the year 1801, when profiting by the experience of his predecessors after careful study of the problem, Jacquard introduced the machine which bears his name, and revolutionized the art of weaving.

The Jacquard machine may be defined as a piece of mechanism placed above a loom for the purpose of raising warp in any possible order a previously designed pattern may indicate.

The framework is of iron, strongly built, in order that the various parts may stand the strain to which they are subjected during the process of weaving. The steel hooks or wires which raise the warp are placed in an upright position, the needles occupying a horizontal position. Every needle is connected to a hook in such a manner that when the needle is pressed back by a card the hook is carried back also. A spring at the end of each needle sends both hooks and needles back to their original position. Each hook has a crook at the lower as well as the upper end. To the crook at the lower end the harness cords are fastened, and at the lower end of the harness cords the heddles are attached. In the centre of each heddle a small metal eye called a mail is fastened. Through the eye of the mail the warp is drawn. Below each heddle an iron weight called a lingo is attached for the purpose of keeping harness cord, heddle, mail, and warp in the proper position.

An important part of the machine is called the griffe. It is an oblong iron frame containing as many strips of iron called the bars, or knives, as there are rows of hooks lengthways in the machine. Each of these bars rests directly under the upper crooks of the hooks. The griffe has a rising and falling motion. When it moves upward it raises all the hooks whose upper crooks rest directly above the bars or knives, allowing those hooks which have been pushed aside by the card to remain down.

Another important part of the machine is the cylinder, on which the cards are carried backward and forward, to and from the points of the needles when the loom is in operation. It has four sides, each side being perforated with as many holes as there are needles in the machine, or holes in a fully punched card.

To control the movement of the hooks a pattern is painted on squared design paper. If it is to be woven by means of a 400 machine the designer cannot use more than 400 small squares from right to left on design paper; or, if the pattern is to be woven by a 600 machine, he cannot exceed 600, or 1,200 if made to suit a 1,200 machine, unless he makes use of hooks belonging to two extra rows, with which Jacquard machines are usually furnished. Neither is he compelled to use the full number of hooks available, as the pattern may be subdivided into two, four, six, or any number of parts required, but it would be necessary to paint out the full extent of the design unless the first part could be reproduced on an even number of rows, in which case the card stamper would go over the part painted as often as necessary, in order to indicate the complete number of harness cords on the card.

When the pattern has been completed it is given to the card stamper, who punches holes in the cards wherever the design indicates that warp is to be raised.

When the cards have all been cut they are laced together in regular rotation and placed upon the cylinder, around which they revolve in an endless chain. The loom is then started, and the cylinder carrying the cards with it moves toward the needle points, against which they are pressed. Where no holes have been punched, the card forces the needles back. The needles carry the hooks with them out of the way of the griffe bars, which rise at the same moment. This allows the warp to remain down, resting on the shuttle race, but where holes have been punched in the card, the needles enter, allowing the hooks to remain undisturbed, their upper crooks resting directly over the griffe bars, which, when rising, lift hooks, harness cords, and warp, forming a shed through which the shuttle passes.

From this it will be evident that to raise warp, holes must be punched in the card, and where warp is to be left down, the card must be left uncut. The Jacquard machines generally used in the manufacture of upholstery fabrics range in capacity from 624 to 2,608 hooks. Within recent years a new machine known as the fine index Jacquard has come rapidly into favor. It is more accurately built than the older type known as the French index machine, and contains 80 full rows of 16 holes, and 24 extra holes on the peg hole rows, or a total of 1,304 holes on one card, a little larger than a 624 hook French index card.

For weaving fine damask goods, the machines generally used are known as double lift, single cylinder Jacquards, while manufacturers of such fabrics as turkey red damask table covers, use the double lift, double cylinder machine; another Jacquard called the rise and drop machine is also much used by upholstery goods manufacturers, these Jacquards being operated at a considerably higher speed than is obtainable with an ordinary straight lift, single acting machine.

In the double lift single cylinder machine, for example, there are double the number of hooks contained in a single lift Jacquard of the same capacity; although each has the same number of needles, there are also two griffes which work alternately, thus enabling the loom to be driven at a higher rate of speed, each griffe and the hooks it controls coming into operation at

each alternate pick only, thereby avoiding unnecessary friction of both machine and warp.

In the double lift, double cylinder Jacquard, the pattern cards are divided into two sets, all odd-numbered cards being placed on one cylinder, and evenly numbered cards on the other. When the loom is in operation the cylinders come into play alternately, the odd cards and cylinder for the first pick, the even cards and cylinder for the second pick, and so on, each cylinder working at the rate of about 70 picks per minute, or 140 for both.

In addition to these machines there are a considerable variety of other makes adapted or modified to suit special conditions. The twill Jacquard, for example, designed to weave fine damask and other fabrics requiring a great number of warp ends with a machine of small hook capacity, the Jacquard in this case weaving both figure and ground, thereby greatly reducing the cost of designing and card-stamping. The cross border Jacquard is the name given to another style of double cylinder machine used for weaving table covers and border fabrics. In this case the cards for weaving the border are placed on one cylinder, and those forming the centre on the other, each cylinder being called into action to weave its own part of the pattern only.

Other varieties of machines might be mentioned, but those already referred to are sufficient to show that a Jacquard machine which might be perfectly adapted to a certain class of work would probably be of little use for anything else.

The "tie-up" is the technical term applied to the method by which the various harness cords controlling the warp are connected to the hooks of the machine, in order to form the elaborate patterns required for Jacquard woven fabrics in general.

The tying up may be accomplished in the three following ways: (1) By what is termed the straight tie method; (2) by the point or centre tie method; and (3) by those two methods in combination.

When the harness is tied up so that each end in the warp is controlled by a separate hook, it is known as a straight through single tie, which, for designing purposes is the best possible arrangement of the harness cords, as it enables the designer to execute a pattern extending from selvage to selvage without being compelled to repeat any portion unless found desirable. This method of tying up is rarely ever used, however, unless for narrow fabrics, or large panels woven in imitation of Gobelin tapestry, on account of the great expense it would necessarily involve for designing and card stamping, the manufacturer finding it much more economical to use the straight repeated tie, or the point tie, by means of which he could weave with a 1,200 machine, a damask or tapestry curtain, for example, containing 9,600 warp ends, in the full width of the fabric, by tying up the harness so that the pattern would be repeated eight times, to accomplish which the comberboard would require to be separated into eight equal divisions, each containing 1,200 holes and the same number of harness cords, the first cord from each division being connected to the first hook, the second cord from each division to the second hook, the third cord from each division to the third hook, and so on, so that by raising any particular hook eight warp ends would be lifted, one from each division, all forming a portion of the design exactly alike, each in its own division.

From this it will be evident that the number of times a pattern may be repeated in the width of the fabric depends upon two things. In the first place, upon the number of hooks which the machine contains, and in the second place, upon the texture of the fabric to be produced, the finer the texture the greater the number of hooks necessary, in order to form a wide repeat.

The second tie-up referred to, the point, or centre tie, is generally adopted when the manufacturer desires a larger and more imposing style of design than is obtainable with the ordinary straight repeated tie.

For example, by using a 600 machine tied up straight, so as to give a warp texture of 100 ends per inch, the width of one repeat of the pattern would be limited to six inches, but by tying up the same number of ends per inch, using the point or centre tie method, the width of one repeat of the pattern would be 12 inches, and the number of harness cords and warp ends 1,200, controlled by 600 hooks.

This tie-up has one disadvantage, however, as it can only be used in the production of designs which are symmetrical, or alike on both sides of a line drawn from top to bottom, in the centre of the full repeat. In regard to the arrangement of harness cords for curtains, table covers, etc., for which this tie-up is much used, the first hook in the Jacquard machine is generally made to control two harness cords in the exact centre of the comberboard, the last hook controlling two harness cords, one of which is at the extreme left, and the other at the extreme right of the comberboard.

The combined point and straight tie is used principally for curtains, table covers, couch covers, and other fabrics requiring side borders, this method being adopted because the pattern repeat can be increased thereby. For fine weaves, however, a machine more limited in capacity than a 1,248 hook French index, or the 1,304 hook fine index Jacquard, will hardly be found serviceable, the 600 machine restricting the designer to very small patterns, which, while cheapening the cost of production a trifle on that account, and because fewer cards are required, would still be unprofitable, as the woven product could not compete with goods of the same texture ornamented with larger and more imposing designs; however, for cheap fabrics, such as turkey red damask, the 600 machine is commonly used, with the harness tied up to give a straight tie centre and a point tie border, with a warp texture of from 60 to 70 ends per inch, finished goods.

In medium grade fabrics the warp generally varies between 90 and 100 ends per inch, the 1,248 or 1,304 hook machine giving a curtain 50 inches wide, containing 4 straight repeats of 1,200 ends each, equal to 96 ends per inch, but as a curtain without a border is more or less unfinished, the machine could be used to greater advantage by dividing the hooks into two parts, the first 600 tied up point tie in three 12½ inch repeats, and the second 600 tied up straight, so as to give two borders, each six and a quarter inches wide, by which means the full width of 50 inches would be secured.

For the finest fabrics where extensive single scale patterns are necessary, larger machines must be used, but if the cost of production must be reduced to a minimum, compound harness shafts may be used, with as many ends to each mail as are necessary to obtain the desired result.

When tying up has been completed, the loom is then ready for the warp, which for cotton damask and similar fabrics is generally delivered at the mill by the cotton spinner, undyed, and in chain form, spun to the counts or number wanted, the length of the chain and the number of ends it may contain varying to suit the requirements of different manufacturers, chains from 500 to 600 yards long and containing 1,200 ends being commonly used for 50 inch wide cotton damask fabrics, with a warp texture of 96 ends per inch, finished goods, a warp of this description requiring four chains, each containing 1,200 ends, in order to make up the full warp of 4,800 ends.

After the warp has been dyed the necessary color, it is sent to the beamer, who begins by taking the ends of the warp containing the pin lease, which he twists around several wooden pins on what is known as the rack, in order to regulate the tension with which it passes around another tension device, composed of three large hollow wooden rollers, or drums, as the beamers call them; the warp is then, by means of the pin lease, passed through the dents of a coarse reed suspended from the ceiling, then distributed over a second fixed reed to the required width, which is usually a little in excess of the width of the warp in the loom reed. Thence it is passed under two iron rollers, the second of which presses the warp down on the beam, causing it to go on firmly; it is then fastened to the beam, and the actual work begun, the beamer standing eight or ten feet from the beam, using the coarse hanging reed already referred to for the purpose of unraveling the warp, and causing it to pass through the fixed reed and on to the beam evenly, great care being exercised in order that all slack, crossed, or broken ends may be adjusted, this being absolutely necessary in order that the weaver may be saved annoyance and loss of time when the warp is in the loom.

The foregoing description applies to warps which can be beamed directly from the chain, but the warp for many varieties of cotton fabrics is not strong enough to stand the friction and strain of weaving, and requires different treatment previous to beaming.

Sea Island cotton, grown in the Fiji Islands, for example, has the longest fibre of any variety, the length of which runs from 1.25 to 1.90 inches, with the American variety of Sea Island cotton a close second, it varying between 1.60 and 1.80 inches, while Texas grown cotton is shorter in staple than any other variety, running between 0.70 and 0.95 inches. From this it will be seen that a single or slack twisted thread will be materially strengthened if coated with some starchy substance, the basis of which may be flour, starch, sago, or any other suitable medium. This is what is done, and the process involved is termed dressing the warp, special machines being required for the purpose.

Cotton, however, is not the only warp so treated. Linen warp for table damask is also dressed before beaming, the object being not only to enable it to stand the friction of weaving, but because by that means the cloth takes on a superior finish, which is one of the desirable features of table damask, and which enhances its value accordingly.

In regard to silk, the most beautiful and costly yarn employed in the manufacture of textiles, it is extensively used both as warp and filling, in the finest grades of silk damask and brocades.

As it comes from the cocoon, or covering with which the silk-worm protects itself when in the chrysalis stage of its existence, it is too delicate to have any commercial value, but during the process of reeling four, five, or six threads are taken from as many cocoons and formed into one fine continuous thread, called singles, the reeling being accomplished by placing the cocoons in warm water, which softens the natural gum they contain and binds the group of separate strands into a single thread.

Tram silk is the name by which reeled silk filling yarn is known, two or more singles being loosely twisted together for that purpose.

Organzine is the name given to reeled silk warp yarn. It also is formed with singles, twisted separately, then doubled and twisted again, thus forming a remarkably strong and brilliant thread.

Spun silk is also in great demand for fine damask warps. It, however, has not the brilliancy of reeled silk, being formed with cocoons which have been pierced, or otherwise spoiled, and which, along with the refuse and waste accumulating during the reeling process, is torn up, then carded, and spun to the counts or number desired.

In regard to the warping and beaming of silk, it may be said that organzine and spun silk warp used in the fine silk damask trade, is bought in skein form, and in the gray, which, after being dyed, is wound on large bobbins, then transferred to the warping mills in sections, the creel on which the bobbins are placed not being large enough to hold all the bobbins necessary for the completion of the entire warp at one operation. After the warp has been put on the mill it is wound around the beam; when this is finished it is taken charge of by the twister, whose duty it is to twist the ends of the new warp to the corresponding ends of a short length of the old one which has been left in the loom for that purpose; but in the case of a new tie-up, or any change in the arrangement of the mails, which occurs when a straight tie for single warp fabrics is altered to suit a two or three warp weave, without cutting down the harness, the old warp would require to be taken out of the loom, and the new warp drawn through the mails and reed as required, before being ready for weaving.

Wool, jute, ramie, and other yarns are also used in the manufacture of damask fabrics, but the foregoing description will furnish a general idea of the warping, beaming, and twisting operations involved.

The next thing to be considered is the designing of patterns for Jacquard fabrics, this subject being one of vital importance to the manufacturer of high class ornamental textiles, the prosperity or decline of a business of this character depending in a great measure on the artistic ability of those responsible for each season's patterns.

Those unfamiliar with textile designing will probably imagine that the creation of new pat-

terns lies entirely with the designer, which to a certain extent is true, but, generally speaking, the designer is the medium through which the ideas of the mill owner, manager, salesman, or other supposed expert find expression. If this important work is performed by a man of refined taste, in close touch with the trade, and always on the lookout for novel ideas in weave and design, if he is or has been a good original designer, and is familiar with fabric construction, so much the better. The business fortunate enough to possess a man with these qualifications will always secure its share of whatever trade is being done; but, unfortunately for some manufacturers, the designer is looked upon as of no more value to the firm than the man who oils a machine and keeps it running, while the head of the department may recently have been employed as a weaver or card-stamper, who, because of fancied executive ability, has been placed in charge of this important department, with the result that his first thought is to secure the cheapest men on the market, who produce work, which, from lack of proper training, he cannot perceive to be common and devoid of originality, and which, instead of creating dividends, will in time sap the foundations of what might have been, under proper direction, a profitable business.

Among small manufacturers the usual custom is to buy all patterns required from designers who work for the general public, but large concerns as a rule consider it more advantageous to employ a staff of draughtsmen, under the supervision of a head designer, who, in addition to ability as an artist, originator, and colorist, should be familiar with the Jacquard machine, the various methods of tying up, card stamping, and fabric construction. Men with these qualifications are not easily obtained, the technical man as a rule being of no use as an originator, while the designer capable of executing good original work, generally looks with indifference, if not contempt, on the various mechanical operations by which the design is transferred to the cloth, and fails to realize the importance of mastering these details until he finds himself outclassed by one who equals or excels him as an artist, and who, in addition, has burned the midnight oil, in order to acquire the technical knowledge which renders his services valuable.

When the designer is commissioned to prepare a pattern for any of the finer grades of Jacquard fabrics, silk damask furniture covering for example, he first prepares a rough charcoal sketch, drawing the figures the same size as they will appear in the cloth; when satisfied with what he has done, he takes a sheet of tracing paper and goes over the drawing carefully, making the outlines definite, and introducing improvements wherever possible. This carefully drawn tracing is then transferred to a sheet of drawing-paper, on which a background of a suitable color has been previously painted. When this is accomplished, the sketch is painted to resemble the finished cloth, after which it is left for the manufacturer or his representative to decide whether or not it shall be given to the draughtsman to transfer to squared design paper.

On the other hand, some manufacturers consider it a waste of time to prepare a painted sketch, and in the case of designs for many of the coarser grade of textiles, and for one warp one shuttle weaves, such as cotton or linen table damask they are right, a shaded outline sketch being sufficient, but for silk damask and other high grade upholstery fabrics, where fine drawing and careful coloring are essential, a cloth-size painted sketch should always be prepared, not merely as a guide to the draughtsman and colorist, but because it is the only way to secure the best results.

After it has been decided that the sketch may be proceeded with, it is given to the draughtsman to transfer to squared design paper, the simplest and best way to accomplish which is by using the diverging scale, by means of which the sketch may be speedily and accurately ruled into as many squares as there are large squares in one full repeat of the pattern on design paper. Suppose, for example, that the sketch was for cotton damask goods, a 1,200 Jacquard machine being used, the cloth texture being 100 ends warp and 50 picks per inch, 1,200 hooks in one full repeat divided by 100 hooks per inch shows one repeat of the pattern to be 12 inches wide. The design paper necessary for the reproduction of this sketch may be 16 x 8, 12 x 6, 8 x 4, or any paper giving the proportion of 100 ends to 50 picks. Supposing that the draughtsman decided to use 16 x 8 paper, he would ascertain the number of squares into which the sketch should be ruled from left to right by dividing 1,200 by 16, which would give 75, that being the number of large squares in one repeat of the pattern, on design paper. Should this, in his estimation, cut up the sketch into too many squares, he could rule it into half that number, and mark the design paper to correspond.

When the sketch has been squared in this manner, the drawing is copied free-hand from the small squares on the sketch to the larger ones on design papers, this being continued until the whole pattern is reproduced in outline. It is then checked out with colors, representing those on the sketch, although generally brighter and more definite in hue in order that the card-stamper may have no trouble. When this has been accomplished the work of the designer and draughtsman is at an end, and the pattern is given to the card-stamper to be reproduced on the cards.

For a considerable time after the introduction of the Jacquard machine this was one of the most tedious and expensive operations connected with pattern-weaving, the first appliance for perforating the cardboard being simply a common hand-punch used in accordance with the requirements of the design, a second person reading the order of stamping for the guidance of the one who used the punch.

At the present day the cards are stamped by the piano machine, so called because in some respects it is supposed to resemble the musical instrument of that name, the design being placed on a reading-board in front of the stamper, while the keys which control the punches are operated by the fingers, and the card moved along from row to row by means of two pedals, manipulated by the feet. The machines used for stamping damask and other classes of upholstery fabrics are the French index, made to stamp 12 holes to each row, and the fine index, 16 holes to each row, the card guide in these machines being adjustable and self-centring,

so that cards of different widths may be stamped thereon.

Before commencing to stamp from a design similar to that described, the card-stamper would rule the pattern into 100 divisions across, with lines drawn from top to bottom by means of a lead pencil, each of these divisions containing 12 small squares crossways to each line, corresponding to 12 holes in each row on the card, and 12 needles and hooks in the Jacquard machine, and the same number of ends of warp, the full 100 divisions corresponding to the 1,200 hooks forming the tie or repeat of the pattern, and all the various repeats in addition, by which the full width of the woven fabric is made up.

After the design paper has been ruled, the first half, corresponding to the first 600 hooks and ends, is placed in the reading frame and the work of stamping begun, the pattern being read from right to left, from the bottom line upward, each line corresponding to one pick on one-shuttle work, two picks on two-shuttle work, three picks on three-shuttle work, and so on. When both halves of the pattern have been stamped the cards are laced together by hand or machine, this work being generally executed by boys, who, when inexperienced, occasionally make mistakes by turning the cards around, or upside down, and lacing them when thus misplaced.

For example: a 600 Jacquard machine contains 52 full rows of holes, including the 2 extra rows; total, 624 hooks. If the cards are laced in proper rotation, but turned around so that the first hole in each card takes the place of the 624th, the position of pattern on the cloth would be reversed; that is, figures pointing to the right on design paper would point to the left on cloth, and *vice versa*. With some patterns this would make no difference, as for example, a design composed of two-sided figures, each side the reverse of the other, but should the pattern contain a motto, monogram, or initials, as is often the case with linen damask, to reverse the position of the letters would spoil them entirely.

Another mistake which occasionally happens completely destroys the pattern by cutting it into a series of disjointed stripes, running in the direction of the warp, is caused by lacing the cards in correct rotation, but upside down, thus putting the 12th row of holes in the place of the 1st, which, on a 12-row machine, would cause the 1st row of hooks to control the 12th row of harness cords, the 2d row of hooks to control the 11th row, and the 3d row of hooks to control the 10th row, and so on, which, occurring on every card, destroys the pattern in the manner described.

Genuine damask, the weaving of which will now be explained, may be distinguished from other damask fabrics, so-called, by the fact that both ground and figure are eight-shaft satin weaves, the ground formed by the warp and the figure by filling, or *vice versa*.

In the weaving of single-scale fabrics, each hook in the machine controls a separate harness cord, mail and warp end, in one repeat of the pattern, a 1,200 machine tied up to give 200 ends per inch would thus form a six-inch wide pattern, but if each hook were made to control two warp ends of the same counts, the pattern repeat would be extended to 12 inches, or 18 inches if three ends were used, 24 inches if four ends were used, and so on, but as each group of ends is raised by a single hook, the outlines of the pattern are as a result coarser than if each end were controlled separately.

In order to form the fine ground weave it is necessary that the Jacquard harness be supplemented by an arrangement of shafts similar to those referred to when describing the draw loom; these shafts, which are placed between the reed and the Jacquard harness, have heddles containing extra long eyes, or loops, so that when occupying a neutral position the warp may be raised and depressed by the other shafts as the Jacquard harness is raising the warp in a mass to form the design. For example: when weaving a four-scale damask four ends are passed through each mail of the Jacquard harness, after which they are drawn separately through the heddles of the shafts in front, the first end through the first heddle of the first shaft, the second end through the first heddle of the second shaft, the third end through the first heddle in the third shaft, and so on, until the entire warp is drawn in. It will thus be seen that each shaft controls one eighth part of the entire warp and that if they are raised in proper rotation an eight-shaft satin will be formed.

The rising and sinking of these shafts is controlled by that part of the mechanism of the loom called the head motion, acted upon by the harness chain, certain balls called raisers and sinkers being arranged thereon, the raisers to lift and the sinkers to sink the shafts in the order necessary to form the weave, which for an eight-shaft satin may be as follows:

1st	pick	1st	shaft	up,	5th	shaft	down.
2d	"	4th	"	"	8th	"	"
3d	"	7th	"	"	3d	"	"
4th	"	2d	"	"	6th	"	"
5th	"	5th	"	"	1st	"	"
6th	"	8th	"	"	4th	"	"
7th	"	3d	"	"	7th	"	"
8th	"	6th	"	"	2d	"	"

One repeat of the ground weave is thus formed, and by raising and depressing the shafts in the same order for each successive pick the pattern and the exquisite satin weave for which fine damask is renowned, will be produced simultaneously.

The cost of production is greatly lessened by this method of weaving, as 4,800 hooks would be required to weave a pattern which could be produced by a 1,200 hook machine and a four-scale tie-up. It would also be necessary to paint the pattern on 4,800 small squares from right to left on design paper, as against 1,200 required by the four-scale tie, and if a fine index Jacquard is used, four cards would have to be stamped to represent every pick or line on design paper, instead of one as required by 1,200 hooks, thus giving the weaver four sets of cards to look after instead of one, all this additional labor and expense adding nothing to the value of the fabric beyond improving the outline of the pattern somewhat, which, however, for commercial purposes, would not justify the additional outlay, even if wholly practical.

When selecting the requisite design paper for these fabrics it must be remembered that a four-scale damask may contain 200 ends per inch, but as the entire number is controlled by 50 hooks, that number only must be considered. Should there also be 50 picks per inch, 8 x 8,

10 x 10, 12 x 12, or any paper of the same proportion would be suitable. When painting the pattern, red could be used to represent figure, with the ground left white paper, and as the interlacing or stitching together of warp and filling is effected by the shafts, such would not require to be indicated on the design. The stamping of the cards is regulated by the method of weaving, which, in the case of fine silk damask, showing more ground than figure, is usually accomplished with the face of the cloth down, as this lessens the strain on the hooks and also on the lever which raises the griffe. For example: by weaving an eight-shaft satin face up, seven eighths of the warp would be raised and one eighth left down for every pick, but by weaving the cloth face down, one eighth of the warp would be raised and seven eighths left down for each pick, thereby reducing the strain on the machine to a minimum, and at the same time facilitating weaving. The card-stamper would therefore stamp red figure wherever indicated on the design and miss white.

Among the various fine damask fabrics may be mentioned a double-scale one-shuttle weave used principally for upholstering furniture, and which, in the finer grades, is composed of spun silk warp and tram silk filling. In this case each hook controls two ends in every repeat, the Jacquard harness raising both ends as one, while a set of shafts lifts each end separately in order to form the fine satin ground weave. To make this clear, it must be explained that the cloth is woven face down, and that the cards are cut to raise all the warp indicated by the figure painted red on design paper, while the ground warp represented by white is allowed to remain down. From the warp thus left down the shafts raise every eighth end, but as they do not sink any of the warp which has been raised, in order to allow the shuttle to pass under and form figure, the interlacing of warp and filling in the figure part of the fabric must be indicated on design paper, and represented on the card, with the result that at every point of interlacing two ends are left down, except where a shaft happens to lift one when forming the ground weave, but this is purely accidental, as the stitching of the filling by the warp is always done with the object of showing the silk to the best advantage, and while an eighth or sixteenth shaft satin form of stitching could be designed to suit the raising of the shafts, the floating of the silk filling on the face, one of the beautiful features of this fabric, would as a result be destroyed. This class of silk damask is also woven with two and three filling systems, by means of the same arrangement of Jacquard harness and shafts.

When woven with two systems of filling it is known as two-shuttle work, or three-shuttle work when three filling systems are used. When only two colors are used to form the design it is called a two-steady-shuttle pattern, to distinguish it from the same class of damasks in which one shuttle is steadily employed throughout the pattern, while the other is changed from one color to another a number of times in every repeat of the pattern during weaving, thereby cutting one of the filling systems into a series of horizontal stripes of colors, which the skill of the designer must soften and blend into harmony, by proper selection and skilful use of the steady color.

When selecting square design paper to suit a two-shuttle pattern, only half the total number of picks per inch are taken into consideration. For example: a total of 90 picks per inch on cloth would be represented by 45 lines on design paper, but as two cards would require to be stamped to represent the two picks indicated on each line, the full 90 picks per inch are thus made up. In regard to the warp texture, this varies a little, but 180 ends per inch may be considered about correct, and as 180 ends in a double scale tie-up are controlled by 90 hooks the design-paper selected should be in the proportion of 90 ends to 45 picks per inch, 16 x 8, 12 x 6, 8 x 4, or any similar paper would be suitable.

When selecting colors to represent the cloth effect on design paper, yellow may be used to represent the steady shuttle, and red to represent the changing shuttle, it being unnecessary to represent the changes on design paper if a properly executed sketch has been prepared, and also because a change in shuttle is represented by one card only. The background of the pattern should be left white paper, and the stitching on long filling face floats may also be indicated with white, although black or some other color is preferable on account of white having a tendency to peel off.

In this case the cloth would be woven face down, and the cards stamped as follows: First card yellow pick, stamp yellow, miss white, stamp red plain, that is, one end up and one down. Second card red pick, stamp red, miss white, stamp yellow plain.

Analysis of card stamping: First card, yellow pick. Stamping yellow raises all the warp represented on design paper by yellow, and allows the yellow pick to go under and form figure on the face, except where stitching takes place as indicated by white on yellow.

Missing white, allows the warp to remain down in a mass, wherever indicated on the design, except where ends are raised, at regular intervals, by the shafts to form the satin ground weave.

Stamping red plain, raises one half of the warp and leaves the other half down wherever red is indicated on the design, thus forming a plain weave with the yellow pick and the warp on the back of the cloth.

Second card, red pick. Stamping red raises all the warp represented on design paper by red, and allows the red pick to go under and form red figure on the face, except where stitching takes place as indicated by white on red.

Missing white, allows the warp to remain down in a mass wherever indicated on the design, except where ends are raised at regular intervals by the shafts, to form the satin ground weave.

Stamping yellow plain, raises one half of the warp, and leaves the other half down wherever yellow is indicated on the design, thus forming a plain weave, with the red pick and the warp on the back of the cloth.

The lifting of the shafts to form a satin ground weave is generally accomplished by means of certain rows of hooks reserved at each end of the machine for that purpose, the order in which they are raised being indicated on the corresponding rows at the ends of both cards.

Brocatelle is the name given to another variety of silk damask containing several ends to

each mail. As originally woven, the warp was silk, and the filling silk, cotton, or wool. At the present time the term brocatelle is applied to a two-warp two-shuttle fabric used principally as furniture covering. Owing to the nature of the weave, the pattern, which may be formed by spun or organzine silk warp, on a tram silk filling ground, has a rich embossed appearance. The second warp, technically called the binder warp, may be either silk or fine cotton yarn, and is used for the purpose of stitching long floats of the tram silk pick on face and back, usually by means of four shafts forming a three-up and one-down straight twill; while the back pick is generally fine jute or linen the same color as the silk figure warp with which it forms an eight-shaft satin, also by means of shafts.

Designs for brocatelle should be treated in a bold conventional manner, with very little attempt at shading, which destroys the embossed effect of the pattern, and makes the fabric look cheap and common. The figure may be represented on squared paper by red, and the ground left white paper, and as the stitching on both picks is done by shafts, no indication of the same is required. The stitching of the silk pick by the binder warp is done by the head motion; but the satin weave formed by the silk figure warp and the backing pick, is indicated on certain rows at each end of the backing pick card, reserved for that purpose.

Brocade is the richest and most elaborate form of silk damask. It is structurally the same as the two- and three-shuttle damask referred to, but gold and silver filling are often used along with silk in order to enhance the beauty of the fabric.

In each case where reference has been made to the use of shafts they have been described as occupying a position at the back of the reed, and in front of the Jacquard harness, but during recent years a different method of using compound harness has come into use, the new shafts consisting of thin strips of wood hung lengthways, immediately below the Jacquard, and connected by means of cords to rows reserved at each end of the machine, for the purpose of raising them in satin order. The Jacquard harness cords are threaded through holes running from top to bottom of these shafts, so that when the Jacquard lifts, the cords are raised also without disturbing the shafts.

To illustrate: we will suppose that a 16-row fine index Jacquard is to be used for the production of double scale damask, with an eight-shaft satin ground. In this case the total number of ends in one repeat of the pattern would require to be divisible by eight, so that the satin might join at both sides of the repeat, and as the fabric desired is a double-scale weave, each row of 16 hooks would have to carry two shafts, equal to a total of 32 shafts, each controlling one thirty-second part of the warp; so that by raising four shafts in correct order for each pick an eight-shaft satin ground weave would be formed.

By using shafts in this manner there is less strain put upon the warp, as there is a separate harness cord and mail for each end, and no front shafts to trouble the weaver, who, as a result, will find it less difficult to tie in broken ends.

The cheaper grades of damask, embracing worsted hangings, table linen, cotton turkey red, and several other one-warp, one-shuttle weaves are designed and woven on the same general principle, one hook controlling a single harness cord and end; in each repeat of the pattern the square design paper also being in proportion to the exact number of ends and picks per inch, one color on the design representing all the various satins, twills, and shadings of the cloth; while the cards are stamped, and the cloth woven face up, or face down, according to the nature of the particular weave.

WILLIAM LAIRD TURNER,
Teacher of Jacquard Designing, Philadelphia Textile School.

Damaskeen'ing, the art of inlaying iron or steel with other metals, especially gold and silver. It is also known as damascene work. This art is of great antiquity. Herodotus mentions a dish so ornamented; and the shields of some of the forces of the Samnites who fought against Rome were damaskeened. This method of ornamentation was formerly much used in Damascus and is found in modern Persian objects of art. The most beautiful specimens are produced by cutting into the metal with a graver and other tools proper for engraving on steel, and afterward filling up the incisions with a pretty thick gold or silver wire. The cuttings should be made in a dovetail form, so that the wire which is inlaid may adhere the more strongly. An inferior style of damaskeening can be produced by the electrotype process. The pattern is etched on the steel, and gold or silver deposited in the etched lines.

Damasus, the name of two popes. 1. SAINT DAMASUS I. was of the Hispanic race, born about 304, but from an early age he was employed as an inferior minister in the service of the Roman see. He was elected to the papacy 366; but as his election was displeasing to a strong faction in the city they set up a rival Pope, Ursinus. In a riot between the supporters of the two claimants of the papal chair in the Liberian Basilica, represented now by the Church of Santa Maria Maggiore, 137 persons, men and women, lost their lives; and Ammianus Marcellinus, the pagan historian, whose testimony is naturally hostile, declares that the ardor of the rivals to seize the episcopal seat surpassed the ordinary measure of human ambition. But ecclesiastical writers of the time make no mention of the 137 persons said to have lost their lives on this occasion, and its authenticity rests on the narrative of Ammianus alone. Prætextatus, the magistrate, who restored tranquillity to the city, is said to have remarked to the successful Pope, "Make me bishop of the city of Rome and I will straightway be a Christian." Damasus was on terms of intimate friendship with St. Jerome, who was his secretary and counselor, and it was at his pressing instance that Jerome made a new revision and translation of the sacred Scriptures. In his pontificate the Emperor Valentinian I., 370, enacted a law designed to correct a grave abuse which had arisen in the Church — the custom of priests and monks receiving from wealthy penitents, especially women, gifts and legacies for themselves. Valentinian's law now made such gifts and bequests void; further it forbade ecclesiastics and monks to frequent the houses of widows and virgins under severe penalties. It is said that Pope Damasus himself

suggested this law to the emperor, as a means of correcting the abuse at which it was aimed. St. Jerome mournfully confesses the shame he himself felt that the law should have been necessary: "It shames me to say it," he writes, "but idolatrous priests, jockeys (*aurigæ*), and play-actors, and prostitutes come into inheritances; only to clerks and monks is it forbidden by this law. And the prohibition emanates not from persecutors but from Christian princes. Nor do I complain of the law; but I grieve because we have deserved this law." Damasus died 384. His feast is observed 11 December. 2. DAMASUS II. was born in Bavaria, and at an early age was ordained a priest. Later he was consecrated bishop and received the appointment to the diocese of Brixen in Tyrol. In 1047 he was elected Pope, but lived only 23 days after being raised to the pontificate.

Dam'bonite ($C_6H_6(NO_3)_6$), a white crystalline substance existing to the extent of 0.5 per cent in caoutchouc obtained from an unknown tree near the Gaboon, in Africa. It is extracted either by cautious sublimation, or by exhausting the dried juice with alcohol. It forms hexagonal crystals, without odor, but with a sweetish taste.

Dambul, dăm-bool', **Dambool,** or **Dambulla,** a village in the island of Ceylon, at the junction of four lines of road, 70 miles northeast of Colombo. It takes its name from the rock Dambul, a large mass of gneiss and mica schist which rises 550 feet above the surrounding plain, and contains a number of caves, one of them with a long inscription relating to the government of Ceylon in the 12th century, and another with a colossal statue of Buddha hewn out of the rock. The priests of Buddha still officiate in these cave temples.

Dame (Lat. *domina,* mistress), a title of honor which long distinguished high-born ladies from the wives of citizens and of the commonalty in general, and which still is the legal title in Great Britain of a baronet's or a knight's wife. In consequence of the greater courtesy shown toward women of higher rank, arose the custom of prefixing the word *ma* to *dame,* as a special proof of veneration and homage. Hence, too, the virgin-mother was called in France *Notre Dame* (*our* lady, as if no single Christian could exclusively claim the privilege of serving her with the homage of his heart). The daughters of the king of France, as soon as they came into the world, were called *madame;* and this was also the sole title of the wife of the king's eldest brother. In England, the word dame, though not much used, is now applied to married women of all classes. It is also applied particularly to the mistress of a small elementary school, especially if elderly and ignorant. *Madame* is shortened into madam, a usual term of address for ladies in general, but still also a word of honor, applicable, in particular cases, to majesty itself.

Dame aux Camélias, La, lä däm ō kä-mā-lē-ä (Fr. "The Lady of the Camellias"), a novel by Alexander Dumas the Younger, having for its heroine a certain real character, Margaret Gautier, belonging to the *demi-monde* of Paris. The novel appeared in 1848 and was published in dramatized form by Dumas in 1852. The English version of the play is known as 'Camille.'

Dameron, Charles Emile, shärl ā-mēl dā-mē-rôn, French painter: b. Paris 1848. He was a pupil of Pelouse; and has won several medals, one at the Centennial Exposition at Philadelphia, in 1876. His works include: 'Pyramids'; 'Oaks of Grand Moulin'; 'Woodman's Cabin in the Autumn'; 'Valley of the Mantega'; 'Approaching Storm.'

Dames of the Revolution, an American society organized in 1896, and composed of women above the age of 18 years, of good moral character, and of proved descent from ancestors who, either as military, naval, or marine officers, or officials in the service of any one of the 13 original colonies or States, assisted in establishing American independence during the War of the Revolution, or between 19 April 1775, when the hostilities began, and 19 April 1783, when they ceased.

Dame's Violet (*Hesperis matronalis*), the only American representative of the genus *Hesperis,* of the natural order *Cruciferæ,* or mustard family. The genus belongs to Europe and Asia, and the American plants have escaped from cultivation. The pale purple sweet-scented flowers are found in fields and on roadsides in southern New England, westward to Kansas, and also in North Carolina. Other common names, mostly from England, where it is a very common flower, are: Queen's or dame's gillyflower; night-scented gillyflower; damask violet, etc. The flower is extremely cultivated, and garden varieties are found in all tints from purple to white.

Damiana, dā-mĭ-ā'na, a drug derived from the leaves of South America, Mexican and Central American species of *Turnera,* especially *Turnera diffusa.* The botanical relationships of the various species are not well known. The chemical components consist of volatile oil, resin, and bitter principles, and the drug, therefore, acts as the aromatic bitters. It is widely used in many disreputable quack remedies that are practically worthless.

Damiani, dä-mē-ä'nē, or **Damianus, Petrus, Saint, one of the fathers of the Church:** b. Ravenna 1007; d. Fuenza 23 Feb. 1072. In infancy he was abandoned by his mother and then treated inhumanly by one of his brothers who gave him shelter, but another brother, Damianus, undertook his guardianship and gave him a good education. In gratitude, Petrus assumed the name Petrus Damiani, Damianus' Peter. For some years he conducted schools in Ravenna, but at the age of 30 joined a community of hermits and 1041 was elected to be their abbot. The renown of his piety, sanctity, and wisdom having spread widely, brought to his cell people high and low to entreat his prayers or his counsel, and popes and emperors did not disdain to solicit his advice. Made cardinal and bishop of Ostia, 1057, he prevailed on Benedict X., irregularly elected by the dominant faction of the Roman nobility, to resign 1058, and 1062 he induced the anti-Pope Honorius II. to forego his claims to the Roman see. He was an intensely zealous advocate of the reform of the Church and correction of the flagrant abuses which were widespread among the clergy in his time. In his manifesto, well styled by him 'Liber Gomorrhinus' (Book of Gomorrha), he exposes without regard to the dignities held by the offenders, the vices and the unspeakable enormities by which they brought discredit on the Christian profession. Had not the interests of religion de-

manded it, such outspokenness would have been inexcusable and an offense against public morality. Another of his works bears the title, 'De Correctione Episcopi et Papæ' (of correcting a bishop and a Pope). All his life he practised the utmost austerities of the hermit. By decree of Pope Leo XII. his name was added to the roll of Doctors of the Church, and 23 February was appointed as his feast-day.

Da'mianists, or **Angelists,** disciples of Damian, the monophysite patriarch of Alexandria, in the 6th century. They professed a belief in only one nature in Christ. The Council of Chalcedon, in the 5th century, had condemned the heresy held by the Damianists in the 6th century.

Damien, dä-mē-ăn, **Father** (JOSEPH DAMIEN DE VEUSTER), a Belgian priest: b. Louvain 3 Jan. 1840; d. Molokai 10 Aug, 1889. At an early age he decided to become a priest, and in time he found work in his chosen mission field in Honolulu. Here he heard from the bishop the neglected state of the lepers, some 700 or 800 in number, who lived on the small island of Molokai, and he volunteered to live and work among them. From 1877 onward he became physician of their souls and bodies, their magistrate, teacher, carpenter, gardener, cook, and even gravedigger at need. For a long time he worked on single-handed at his noble labors, but was finally joined by another priest. For 12 years he escaped all contagion of the fatal disease, though in constant contact with the sick and dying; but in 1885 the malady appeared in him. He continued unabated his heroic labors till very near his death. Consult: C. W. Stoddard, 'South Sea Idyls'; 'Lepers of Molokai.'

Damiens, Robert François, rō-bār frăn-swä dä-mē-ăn, French fanatic: b. Tieuloy, Artois, 1715; d. Paris 28 March 1757. He enlisted as a soldier, and was afterward a servant in the college of the Jesuits at Paris, but in 1738 left this service in order to marry. He then served in different houses of the capital, robbed one of his masters, a Russian, and saved himself by flight. His mind was disordered when he returned to Paris at the end of 1756. In the beginning of the next year he went to Versailles, took opium for two or three days, and prepared for the crime which he attempted 5 January. As Louis XV. was on the point of getting into his carriage Damiens stabbed him in the right side. The wound was of a trifling nature. Damiens did not attempt to escape. When questioned he said he never intended to kill the king, which he might easily have done. The most cruel tortures he bore with resolution, and could not be induced to confess that he had any accomplices. He asserted that he should not have committed the act had he been bled, as he requested, and that he thought it meritorious. He was condemned to be torn in quarters by horses, and the sentence was executed on the Place de Grève at Paris.

Damietta, dăm-ĭ-ĕt'tă, Egypt, town in Lower Egypt, on one of the principal branches of the Nile, 100 miles north-northeast of Cairo; lat. 31° 25′ N.; lon. 31° 5′ E. It is irregularly built, and contains some fine mosques, bazaars, and marble baths. Damietta was at one time a very important place, and carried on an extensive foreign trade, but is now eclipsed by Alexandria. A bar at the mouth of the Nile prevents large vessels from reaching the town, compelling them to anchor outside, and to load and unload by means of small craft of from 30 to 60 tons burden. A military school and cotton-factory were established here by Mehemet Ali. The ancient town of Damietta (*Tamiáthis*) stood about five miles nearer the sea, or farther north. The danger to which it was exposed, however, from its position on the shores, induced the Egyptian caliphs to change its position, and to remove it to where the modern town now stands about the year 1251. The present town contains many antique columns and blocks, supposed to have been brought from the old city. It is the terminus of a railway from Cairo. Pop. 31,288.

Dammar, dăm'mar, a resin derived from various plants, principally *Agathis dammara* and *A. australis,* both members of the pine family. These are natives of Molucca and the East India Islands, also of the Philippines and New Zealand. Dammar is exuded from the main stems and also from the roots of the plants. In some regions, notably in the mountains of Sumatra, the resin bursts forth in profusion from spontaneous fissures. In other regions artificial incisions are made in the trees, with a yield of resin correspondingly greater. Dammar comes into the market in large masses, or small pieces. It is yellowish, transparent when in small pieces, smooth and brittle, breaking with a clean, glassy fracture and it is readily reduced to powder. It is intermediate in hardness between colophonium and copal. Chemically it contains traces of ethereal oil, dammarolic acid and two resins. It is widely used in pharmacy and in the manufacture of varnishes.

The same name is applied in commerce to the resin of other and unrelated trees. Thus the dammar of shipyards is obtained from a species of *Canarium,* an amyridaceous tree, while black dammar is a kind of pitch derived from the allied *Marignia. Shorea robusta,* a dipteraceous tree, yields pitch and resin used in Indian dockyards, and sometimes also called dammar. Dammar is also occasionally confused with kinds of copal; thus, the resin of *Vateria indica* (*Dipteraceæ*) is sometimes known as dammar or piny dammar, of which the piny varnish of India is compounded. One of the Australian species, *A. robusta,* has been grown in some parts of California with fair success.

Dammara. A genus of coniferous trees now known as *Agathis.* See KAURI.

Dammood', a river in British India, which rises in the district of Ramghur and flows through Bengal, east, southeast, and south a distance of 350 miles. Rich deposits of coal and iron are found in its valley.

Dam'ocles, a native of Syracuse, and one of the courtiers and flatterers of the tyrant Dionysius the Elder. His name has become proverbial in consequence of a well-known anecdote related of him as illustrative of the uncertainty of human greatness and felicity. He had been extolling the grandeur and happiness of Dionysius, whereupon the latter invited him to a magnificent banquet, where he would be regaled with regal fare and royal honors. In the midst of the entertainment, however, Damocles happened to look upward, and perceived a naked sword suspended over his head by a single hair. The sight of this filled him with dismay, and

taught him at what a sacrifice of mental peace and personal security the enjoyments and splendors of royalty may be purchased.

Dámodar, dä-mō'där, a river of Bengal, in India, which after a southeast course, flows into the Hugli, just above the James and Mary Sands and below Calcutta. A little below the mouth of its chief tributary, the Barákhar, which it receives from the north, the Dámodar becomes navigable. The valleys of these two streams contain the coal-fields which produce about four fifths of the whole amount of coal mined in British India. Length about 350 miles.

Da'mon and Phin'tias (not PYTHIAS), two illustrious Syracusans, celebrated as models of constant friendship. Phintias had been unjustly condemned to death by Dionysius the Younger, tyrant of Sicily, but obtained permission to arrange his affairs in a neighboring place on condition that his friend should remain as a pledge of his return. Damon surrendered himself at the prison, ready to suffer death instead of Phintias if he did not return at a fixed time. Unexpected impediments detained him. Damon, still fully convinced of the faithfulness of his friend, was on the way to the place of execution, and the people began to murmur and to pity his credulity, when Phintias suddenly rushed through the crowd into the arms of his friend. While they demand each to die for the other, Dionysius himself approaches, pardons them, and entreats them to admit him a third in their friendship. Schiller has described this adventure in an excellent ballad, 'Die Burgschaft,' and it is the subject of a popular English tragedy.

Damper, a plate in an air-draft or flue, for the purpose of controlling the fire by regulating the area of the passage for the ingress or egress of air as the case may be. Dampers are of various forms. They are to the air-pipe or flue what the valve or faucet is to the duct for steam or liquids. The dampers of furnaces are either in the door of the ash-pit, to regulate the ingress of air, or in the course of or on top of the chimney, to close the egress of the volatile results of combustion. In the latter form they are used in almost all metallurgic furnaces.

In locomotive engines, a kind of iron venetian-blind, fixed to the smoke-box end of the boiler in front of the tubes; it is shut down when the engine is standing, and thus stops the draught and economizes fuel, but it is opened when the engine is running.

In pianofortes, certain movable parts, which are so arranged as to press upon the wires and check their vibration whenever the finger leaves the keyboard. Perfect damping is difficult to obtain, but when efficient it enhances brilliance of execution and distinctness of harmony in a composition.

Dampier, dăm'pēr, **William,** English navigator: b. East Coker, Somerset, June 1652; d. London March 1715. In 1673 he served in the Dutch war, and subsequently engaged in a band of privateers, as they called themselves, although in reality pirates, with whom he roved on the Peruvian coasts. Dampier, wishing to obtain some knowledge of the northern coast of Mexico, joined the crew of a Capt. Swan, who cruised in the hopes of meeting the annual royal Manila ship, which, however, escaped them. Swan and Dampier were resolved to steer for the East Indies, and they accordingly crossed the Pacific, and after various adventures Dampier and others were left ashore on Nicobar Island. After making several trading voyages in the Eastern seas he entered as a gunner in the fort at Bencoolen. Upon this coast he remained until 1691, when he found means to return home. In 1697 he published an account of his voyage round the world, which had a great success, and was supplemented by a second volume in 1699. He now obtained command of a ship in the king's service fitted out for a voyage of discovery. In this he made important explorations on the coasts of Australia and New Guinea. Dampier's writings include: 'A Voyage Round the World' (1697); 'A Discourse of Winds' (1699); 'Vindication of the Voyage to the South Sea' (1707); 'Voyages to the Bay of Campeachy' (1729). They bear all the marks of fidelity; and the nautical remarks display much professional and even philosophical knowledge. His observations on natural objects are also extremely clear and particular.

Dampier, the name of several places in Australasia: (1) Dampier Archipelago, a cluster of about 20 small rocky islands off the northwest coast of Australia, in lat. 21° S., and lon. 117° E., divided by the Mermaid Strait in two groups; in the east is Rosemary, the largest island. (2) Dampier Island, off the northeast coast of New Guinea, with a volcano about 5,250 feet high. (3) Dampier's Land, a peninsula of western Australia, fertile and well watered, lying between King Sound and the Indian Ocean. (4) Dampier Strait, between New Guinea and the archipelago of New Britain, forming, with Goschen Strait to the southeast, the shortest route from eastern Australia to China by some 300 miles. (5) Dampier Strait, separating the island of Waigiu from the northwest extremity of New Guinea, the safest and easiest passage between the Indian and Pacific oceans.

Damping-off, the rotting of seedlings and cuttings in the seed-bed and the cutting bench, usually just above the surface of the soil. The immediate cause is a soil fungus (*Artotragus* or *Pythium debaryanum*) which feeds upon decaying organic matter until it obtains a favorable opportunity for attacking a living host. This opportunity is generally afforded by a weakened condition of the seedlings or cuttings due to a more or less stagnated atmosphere highly charged with moisture and of rather high temperature. The fungus gains entrance to the weakened stems which soon turn brown or black. The foliage quickly becomes infested and sometimes in a single night a whole seed-bed or bench full of cuttings may become a rotting mass with no healthy plants left. With careful management the trouble can be avoided. The propagating medium should be clean, sharp sand, which should be thoroughly drenched when the bed is watered, the excess water passing quickly away in perfect drainage. The bed should never be allowed to become dry. In short, both seedlings and cuttings should be kept growing steadily and sturdily. The drenching washes the spores of the fungus down through the sand. Should a bed become infested the healthy plants should at once be transferred singly and with as little soil as possible to fresh quarters. Neither freezing nor drying

the soil will kill the fungus, which can live for months when growth is impossible. Sterilizing the sand or soil with steam is sometimes resorted to, the sand being heated for several hours. Less frequently plants in the open air are attacked. In the greenhouse and nursery experience in management will count for much.

Damps, certain deleterious gases which are released in mines. They are distinguished by miners under the names of choke-damp and fire-damp. The former is found in the deepest parts of mines. It extinguishes candles, and often proves fatal to human life. It consists for the most part of carbonic acid gas. The fire-damp, which prevails almost exclusively in coal-mines, is a mixture of light carburetted hydrogen and atmospheric air, and explodes violently whenever it comes in contact with flame. The gas or after-damp which remains in a mine after an explosion is a kind of choke-damp, and consists of a mixture of carbonic acid gas — produced by the combustion of the carburetted hydrogen — and the nitrogen of the air. It is of course fatal. The accidents which formerly occurred so frequently both to the machinery and to miners, arising from the fire-damp, are, if due precaution is used, obviated by Sir Humphry Davy's safety-lamp. This lamp consists of a cylinder of wire gauze, about four inches in diameter and one foot in length, having a double top, securely fastened by doubling over to a brass rim, which screws on to the lamp itself below. The whole of the wire gauze is protected and rendered convenient for carrying by a triangular wire frame and a ring at the top. The wire gauze is made either of iron or copper, the wire being at least one thirtieth of an inch in diameter, and woven together so as to leave 625 apertures in a square inch. The body of the lamp is of riveted copper, or of massy cast brass or cast iron, the screws fitting so completely as to leave no aperture into the body of the lamp. When the lamp is lighted, it affords the miner all the light which he requires, and renders him perfectly secure, even though entirely enveloped with the gaseous mixture which, with an ordinary light, would immediately explode. The first effect of the fire-damp atmosphere is to increase the length and size of the flame. When the carburetted hydrogen forms as much as one twelfth of the volume of the air, the gauze cylinder becomes filled with a feeble blue flame, but the flame of the wick appears burning brightly within the blue flame, and the light of the wick expands until the inflammable gas increases to one sixth or one fifth, when it is lost in the flame of the fire-damp, which now fills the cylinder with a pretty strong light. As long as this explosive mixture of gas exists in contact with the lamp, so long it will give light; and when it is extinguished, which happens when the foul air constitutes as much as one third of the volume of the atmosphere, the air is no longer fit for respiration; for though animal life will continue when flame is extinguished, yet it is always with suffering. A coil of platinum wire being fixed above the wick of the lamp, within the gauze cylinder, the metal continues to glow long after the lamp is extinguished, and affords a sufficient light to enable the miner to make his escape. The effect of the safety lamp is supposed to depend on the cooling agency of the wire gauze, exerted on the portion of gas burning within the cylinder. Hence a lamp may be secure where there is no current of an explosive mixture to occasion its being strongly heated, and yet not safe when the current passes through it with great rapidity. But any atmosphere, however explosive, may be rendered harmless by increasing the cooling surface, which may be done either by diminishing the size of the apertures, or by increasing their depth, both of which are perfectly within the power of the manufacturer of the wire gauze.

Damrosch, dăm'rŏsh, **Frank,** American musician: b. Breslau, Prussia, 22 June 1859. He was trained by his father, Leopold (q.v.), and in 1882 became conductor of the Denver Chorus Club and supervisor of music in the public schools of that city. He was chorus master at the Metropolitan Opera House, New York, from 1885 to 1891, and in 1892 organized the People's Singing Class. Since 1897 he has been supervisor of music in the public schools of New York.

Damrosch, Leopold, German musician: b. Posen, Prussia, 22 Oct. 1832; d. New York 15 Feb. 1885. He was graduated from the University of Berlin, and began the practice of medicine; but his love for music predominated, and in 1864 he gave up his medical profession and started on a tour as violinist. He met with great success and on his return to Posen was appointed musical director at the Stadt Theater. He subsequently held a similar post in Breslau. Coming to the United States, he was made leader of the Arion Society in New York, and subsequently founded the Oratorio and Symphony societies of that city.

Damrosch, Walter Johannes, American musician: b. Breslau, Prussia, 30 Jan. 1862. He is a son of Leopold Damrosch (q.v.), and has been a citizen of the United States since 1871. He inherited the musical talent of his father, and succeeded him in his enterprises. He is the special exponent of the Wagnerian school of music, and has conducted operatic performances in all the large cities, proving himself a most acceptable leader. He has also written an opera founded on Hawthorne's tale of 'The Scarlet Letter,' besides other excellent music.

Dams. To dam (originally, to stop up) is to obstruct or restrain the flow of a liquid. In engineering, a dam is a barrier to constrain or keep back a flow of water. Dams vary in structure as widely as the physical character of their sites, the purpose for which constructed, and the materials used. Every dam is, in a sense, a special adaptation, and may be referred to some more or less varying type.

The art of dam building is coeval with civilization when the stream from the mountains, spending itself in the arid plain, was diverted for irrigation. The gardens and the water-wheels of Damascus are back of history. The Nile valley, the Euphrates-Tigris plain, the Oxus and Jaxartes, and much of India, developed civilization in the application of the waters to the land, and this will be the history of their restoration. It was a time of mighty endeavor in hydraulic engineering, little understood in humid lands, demanding a high social organization and a closely knit state. Cyrus turned the Euphrates from Babylon and an em

pire fell and rose. Lake Moeris regulated the floods of the Nile in the days of Joseph, and its operation is credited with the seven fat and the seven lean years by some antiquarians; and Bahr Jussuf (meaning, the water carrier) still leads to the Fayum basin. Modern Egypt has built the barrage across the Rosetta and Damietta mouths of the Nile for the continuous irrigation of the delta, and the dam at Assouam puts under servitude more than 6,000,000 acres of new lands, nearly doubling Egypt.

The old Hindu anicut turned the flow of formidable rivers into irrigation canals, and as a rock-fill with long paved slope and an apron down stream, it serves the engineers of India to-day. The ancient tanks of India are natural depressions closed by a bank of earth, sometimes of great height and miles in length, formed probably by basket carriage and consolidated by tramping.

The protection of lands against flood by embankments, levees, or dykes, belongs to primitive times. Along the Yellow River ("China's Sorrow") the Chinese built levees in double line with cross-banks, so that the failure of the front line at any point by undercutting or other cause, would only inundate the check immediately behind. The Po and Adige of northern Italy were embanked in remote times and the history of these works is of great interest.

Taking counsel from the beaver the basket-work dam of moderate height on alluvial streams was long since devised, and from this has evolved the modern bank protection of braided willow mattress in use on Western rivers. The primitive neighborhood grinding-mill led the head-race up-stream to a dam of simple type.

The utilities widen in approaching the modern era. The stream flow of the growing season no longer suffices for the needs of irrigation and the surplus is impounded for larger areas and the time of need. The uncertain navigation of streams no longer satisfies commerce, and canal systems follow with extensive storage and feed-water developments, and this again, with steam navigation, gives away to the direct improvement and the canalization of river beds by means of fixed and movable dams. Growing cities need water supplies, a demand now universal, and often extraordinary structures are required. Industries develop with the water-power, the turbine makes higher heads available and changes the problem of dam construction for power purposes; and finally comes the electric generator and distant transmission with further demands.

The United States contains enough water power capable of development to turn every wheel and do the heating and cooking for all the people that can live on the land, and next to the land the waters are the most valuable economic asset. The future may well see an era of dam and reservoir building, in the humid as well as in the arid regions, for the better equalization of the flow of streams, in the interest of navigation, the alluvial lands and of water power and for the development of fisheries. The acre of water may be made as valuable as the acre of land.

Embankments.— Embankments for restraining water are widely applied and have special names: as levees and dykes for protecting lands, banks forming canal prisms, coffer-dams, reservoir embankments, and the embankment with spillway adjunct for impounding water, the latter being called a dam.

The levee is built of the alluvium of river bottoms to restrain flood overflows. It is given sufficient freeboard above the greatest known flood, the top width is usually greater than the height and the side slopes are very flat, sometimes as low as 5 or 6 to 1. The site is cleared of all humus and other vegetable matter and well broken, so as to bond the embankment to the natural ground, and all such material is excluded in forming the embankment. A "muck-ditch" is made when deemed necessary, and "buck-shot" or other water-tight material is puddled in and carried up into the embankment as a core.

Many hundred miles of levees have been built along the Mississippi River and its tributaries, some of them of very large proportions. When built according to the best practice, well-seasoned and turfed over, failures are very rare, though floods often stand against them for weeks and the material is comparatively mobile when saturated. Failures have been due to insufficient height and the chopping effect of waves, but especially to lack of maintenance and of care at critical periods. The craw-fish burrowed through at the turf line when its removal was omitted, and board fences were built in the levee to intercept this pest, but they decayed and weakened the levee and are now omitted, and less is heard of the craw-fish with the better practice of later years. In northern latitudes the muskrat has also been a nuisance, as in the embankments of the reservoir system at the head-waters of the Mississippi River built for the purpose of increasing the low water flow.

Canal prisms frequently skirt the sides of valleys or contour slopes, partially in excavation with part or full bank on lower side. The material for forming banks is generally far superior to that available for levee construction. The slopes are usually flat, from 2 to 3 on 1, and a water-tight core or face is added in permeable ground, or the entire prism may be given a puddle lining when the percolation is liable to be serious. Sheet piling has been driven in such banks, but this divides the bank and is not now considered good practice. The unwatering of navigable canals in the winter time is also bad practice, as it subjects the inner face to frost action.

Canals are carried across water courses and valleys on supporting embankments, sometimes of great magnitude. Such embankments are given easy slopes and care exercised in forming a water-tight prism above, so as to avoid saturation and the resulting instability.

Ditches for irrigation and hydraulic mining sometimes reach the dignity of large canals, requiring care in the formation of banks. The soil of their location is usually of fine tilth with an admixture of adobe, and such channels generally "seal" quickly with the fine sediment carried in the flowing water of certain seasons.

The embankment used as a coffer-dam, usually encloses some large site, as for the construction of a canal lock or for rock excavation in the dry, and is of a temporary character. Suitable material may be dumped from a trestle, the mass of material formed in water by dumping from a height being usually sufficient. In a notable case, a recent contract for a rock channel in the St. Marys River, a heavy em-

bankment more than a mile long was formed of dredged material to a maximum height of 30 feet, and rock, estimated as wet excavation, was taken out in the dry at a large profit. No great care was taken in this embankment, except to provide suitable material and sufficient mass.

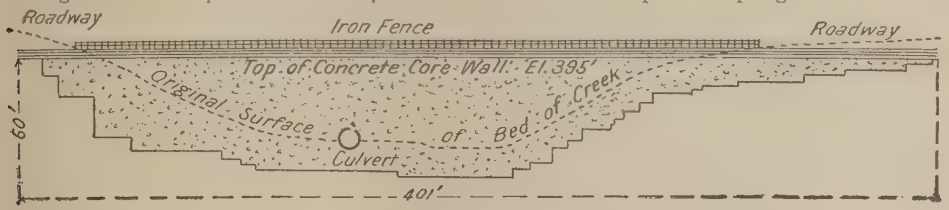
The reservoir embankment proper is usually for a storage or distributing reservoir, as for a municipal water supply. Such reservoirs are from 20 to 30 feet deep and the embankments are formed with great care from selected material placed in thin layers, watered and rolled. The inner face is lined and protected by a face-wall, a pavement of brick, stone pitching, or even rip-rap in some large storage reservoirs. The height of the embankment varies with the supporting ground.

The impounding embankment, or earth-dam, is usually carried across some drainage line between steep valley slopes, so as to make a reservoir in the valley expanses above, and generally seeks to store a large proportion of the run-off. An ample spillway on an independent site is provided to carry the extreme flow of the valley when the reservoir is full.

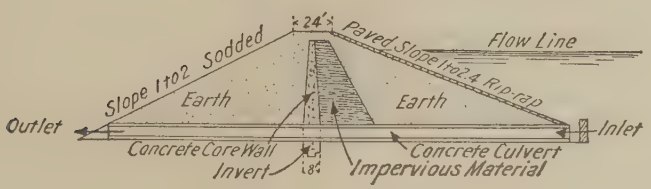
Such embankments are usually made of selected material compacted in layers and provided with a core wall of puddle or masonry reaching down to impermeable strata, and the jet and flume, and the heights are given above natural surface and above the foundation.

Earth-dams have failed by over-topping from insufficient spillways or deficient freeboard, from saturation and sloughing of the rear slopes, and from cutting out around pipes carried through the base. Embankments subject to water action should have slopes much in excess of the so-called "natural" or dry slope. The dividing of a bank vertically by a core, with unequal settlement and the upper half subject to saturation, is to be avoided. Present practice tends to an impermeable up-stream face and upper toe wall or intercept to a safe depth with good drainage behind, thus developing the full stability of the material. Pipe lines through made banks are to be avoided, and in any location great care is needed to prevent seepage along the pipe line.

The hydraulic-filled dam is probably a departure in the right direction. Recent attention has been given to dams of large section, filled by water carriage or by dumping from a height, the finer material up-stream, and having very flat slopes. Such a dam is in reality a mound, and can be made of a wide variety of material, the stability depending upon a moderate ground-water plane through the body of the fill rather than on impermeability. Such plane should not be sufficient to produce springs that will disturb



LONGITUDINAL SECTION



TRANSVERSE SECTION

Earth Dam with Concrete Core Wall. Tomhannock Dam; Water Supply of Troy, N. Y.

side slopes are made easy and pitched with stone, up-stream, or otherwise defended.

The general limit of height is 60 to 100 feet, though higher dams have been built. The following table gives a few examples:

Location	Height	Length	Core
Waverly, N. Y.....	60	322	Masonry
Amsterdam, N. Y.....	65	410	Masonry
Middle Branch, N. Y...	73	740	Masonry
Druid Lake, Baltimore..	119	.....	Puddle
Tabraud, Jackson, Cal..	110–120	.....	None
San Leandro, Oakland, Cal.	125–158	300	None

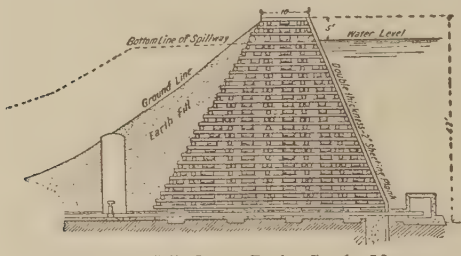
The two last mentioned are hydraulic-fills, suitable material being run in by means of water the material, and the fill can be tightened or "sealed" by means of roily water or mud against the up-stream face.

Timber Dams.— The timber dam across flowing streams for power purposes was well nigh universal in the pioneer development of the country. Timber was plentiful and its uses widely familiar. Wooden wheels with horizontal axes utilized moderate heads, and these were also limited by the height of banks, so as to avoid excessive flowage with sufficient pond so that the flow of the dry season could be used in the daylight hours.

Such dams were usually built for heads of 6 to 16 feet, though the Connecticut River dam at Holyoke had a height of 30 feet. Better heads were often produced by a dam at the

head of some rapid, with a race leading down-stream.

Timber dams were built in a great variety of forms, much depending on the character of the site and the material available. A common type was the crib or "cob-work" structure with the pockets filled with stone, having a broad base, sheeted up-stream, and banked with earth, the spillway and apron dropping in steps down stream. Piling was sometimes driven, capped and sheeted to an apex like the roof of a house,



Cross-section: Crib Dam, Basin Creek, Montana.

the spaces between piling being filled with stone and the up-stream toe banked with earth. Frame dams were also built, a sheeting of timber being supported by triangular frames resting on mudsills; the up-stream slope was flat, usually 2 to 1, the dam being held in place by the weight of the water, the toe being covered by a bank of earth. Log dams were cribbed up and sheeted up-stream like frame-dams; and dams were built of piling and sheeting alone, driven into the river bed.

Timber dams have lasted well where the height has not been excessive, the upper parts have been easily renewed when decayed or worn out, and they have been exempt from wholesale failure with disastrous results. They will always be used in timber regions for manufacturing lumber and with sluiceways for driving logs. No material equals timber in resisting water shock and vibration, and its use will be preferred by many. Under water timber is everlasting, and it will always be a useful material to the hydraulic engineer.

A large proportion of the small powers have been abandoned, and with the development of the turbine higher heads have been sought. The electric generator and transmission has greatly enlarged the water-power field, and this has accentuated the tendency toward higher dams and larger units. In recent years portland cement has become cheap and reliable, and timber less available, and concrete dams with higher heads are coming into use.

Masonry Dams.— Many timber dams have been rebuilt in masonry, including the great dam at Holyoke before referred to. Modern practice combines a number of turbines on a horizontal shaft connected direct to the electric generator, and this demands that the floor of the fore-bay and of the generator room shall be above the back-water of floods, and that the turbines discharge into the tail-bay through draft-tubes. The exacting demands of electrical service require uninterrupted power, or that the head shall be sufficient to give effective results in flood time. These conditions have increased the height of dams to about twice the flood range, with low-water heads of 20 to 40 feet. Some over-fall dams have, however, been carried up to 60 feet.

The approved form for an over-fall dam is a roll-way — a curved crest with a reverse curve extending down-stream as an apron to protect the bottom. The crest and upper slant should be worked out as a gravity curve for the maximum flood, thus avoiding the tendency of the mappe to lift, which has been credited as the source of tremor and vibration. The flash-board is a common error, and failure to remove these in floods has shaken off the tops of dams, in one concrete dam for one third the height.

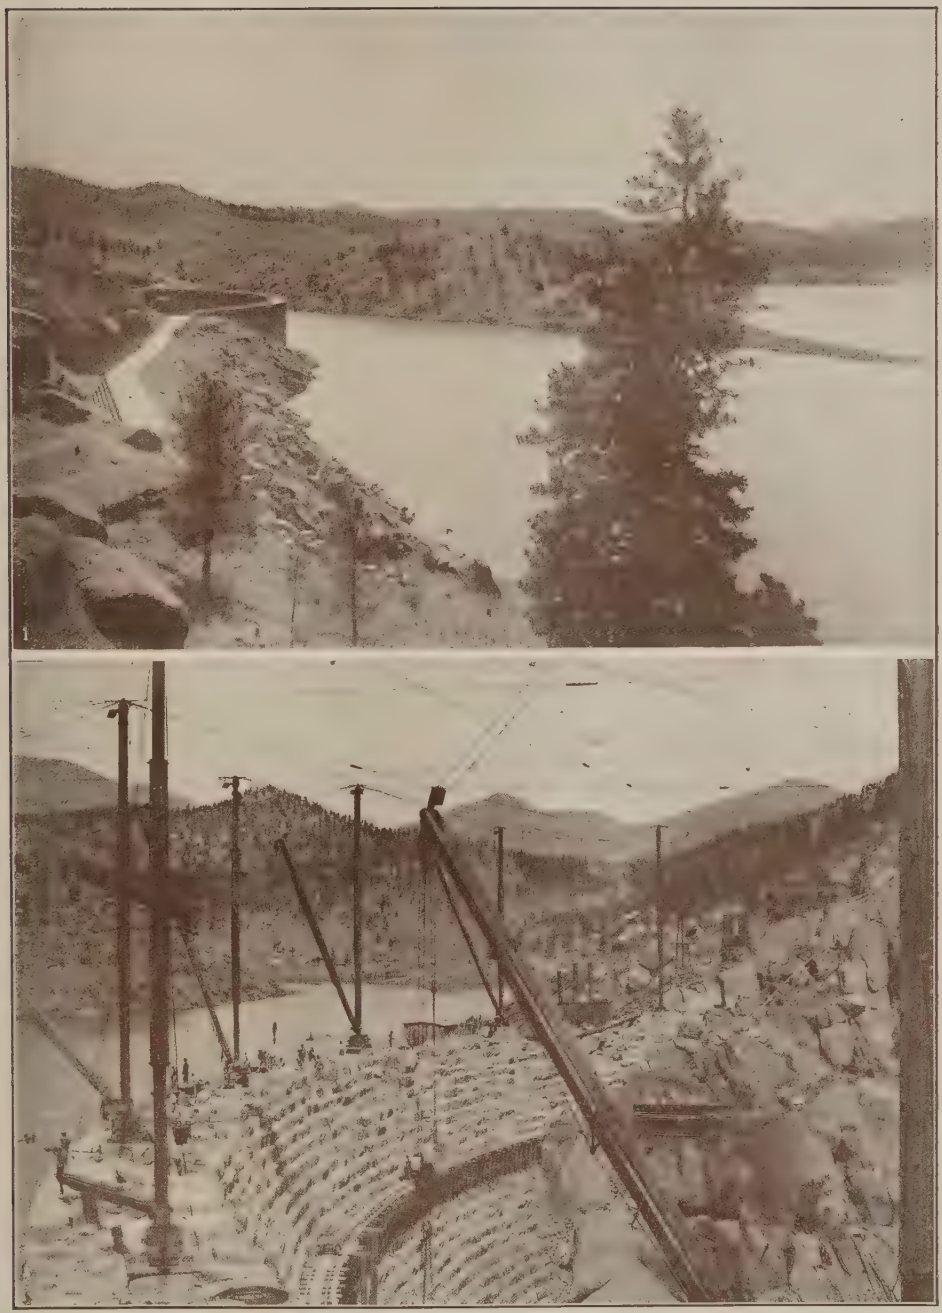
A high and well-formed roll-way dam may be called a speed-generator, and in high-water the horse-power turned into velocity is tremendous; and this is not dissipated by internal work for some distance down-stream. The beds and banks must therefore be defended, and naturally rock sites are sought. These are not always safe, as shown in the failure of the 60-foot dam at Austin, Texas, where the down-stream toe was undermined by reason of the omission of proper defense.

For sites without rock bottom in reach, great care is necessary in defending the channel below from erosion. For such sites the "tumble-bay" dam is best adapted, in which the force of the falling water is dissipated within the confines of the structure. In dams of this type, the sheet of water is given a sheer fall, being well ventilated behind, into the pool or bay which has a depth of ½ to ⅔ the height of the fall, and the water escapes from the bay over a breast wall or roll-way with little or no destructive energy. Some recent designs show a A shaped plan of dam with a triangular tumble-bay closed by a low roll-way, with a bridge of reinforced concrete spanning the roll-way between piers. The bottom of the bay is a heavy bed of concrete defended by a timber floor beneath the sheet of falling water. The proposed dam on rock across the Mississippi River opposite Keokuk, at the foot of the Des Moines Rapids, for a head of 30 to 35 feet, is to be made up of a line of such bays.

High dams without rock foundations will, in many situations, require foundations of bearing piles and a liberal use of sheet piling. The structure has naturally a broad base which is an element of security. Further security may be had by sealing the river bed for some distance up-stream, depending upon its character and the head. Nature will perform this service in time, if a blow-out does not meantime occur, as streams generally carry sediment at some season. The facility with which a water-course can seal itself against a gallery alongside or beneath has amazed some waterworks engineers.

The problem in such foundations is one of percolation around and beneath. The history of the barrage across the two outlets of the Nile, near the head of the delta, is instructive in this connection. A masonry structure was built upon strata of the most mobile character, and has been put in successful operation by sealing the bed up-stream with impermeable material for a distance of 20 times the head on the dam. This experience should assure the possibility of founding a dam on any site.

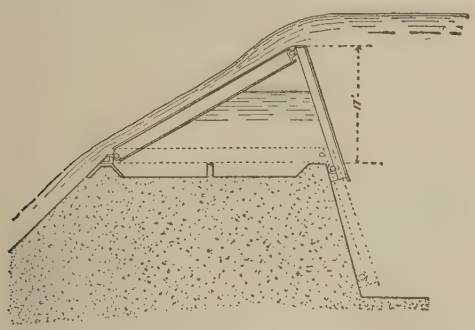
Movable Dams.— In the improvement and canalization of rivers the dams are usually of moderate height, and when of the ordinary type are called "fixed" dams. The purpose of canal-



1. Cheesman Dam and Reservoir. (Depth of water in reservoir, 160 feet, October, 1904.)
2. Cheesman Dam (under construction in 1903).

ization is to maintain the ordinary pool level as high as the adjacent lands will permit without interfering unduly with the flood regimen, and for this end several types of movable dams have been devised. These are much used abroad and a great development is to be expected in this country.

One of these types is the bear-trap first used on the Lehigh navigation of Pennsylvania early



Bear-trap Dam. Water-power Plant, Chicago Drainage Canal, Lockport, Ill.

in the last century. This consisted of a timber platform at or near the level of the stream-bed, with two leaves overlapping and hinged near the up and down stream edges. By introducing water beneath through a regulating sluice these leaves rise with the head of water above until they reach the proper height in the form of a flat ∧ dam. The use of these dams for navigation seems to have disappeared for a time, but continued in the lumber regions as a device for holding a pool of water for storing logs and then flushing the same down the stream. As thus used the bear-trap has been variously altered and made as long as 60 feet, beyond which trouble has occurred from the warping or twisting of the leaves. Various designs have been proposed for waterway purposes. The most notable application is the bear-trap, 160 feet long, installed at Lockport as a part of the "controlling works" of the Chicago Drainage Canal. This is made of metal, is hinged at the top-angle, the upper-leaf dropping in front of a breast-wall. It has a range of 15 feet and is so counter-weighted and controlled that the depth flowing over is practically uniform at any elevation, and it is easily maneuvered by one man.

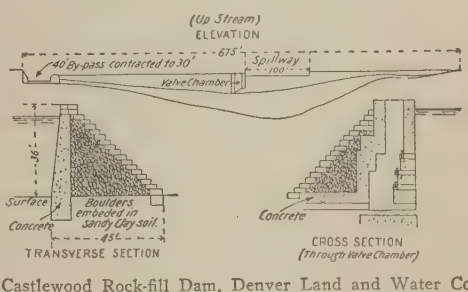
A second type is an evolution from the old "stop-plank" used in mill practice, set vertically or horizontally. The "needle" is a piece of light wood, rectangular, and shaped into a handle at top. These are placed in juxtaposition against a sill on the floor of the pass or on the weir and against a girder above water level. This arrangement is called a "needle-dam." The needles are usually designed for one man to handle, and their application is thus limited to control through a moderate range. It is properly an auxiliary in some other type of movable dam for the purpose of regulating pool level in moderate flows of water. A needle-dam has been built, however, on the Big Sandy River in which large needles are handled by derrick. The horizontal stop-plank has been hinged into a curtain which is unrolled against supports, thus closing the pass.

The shutter or wicket-dam is thus far the favorite for river work. This consists of shutters several feet in width and of the length desired, the lower edge resting against a sill and supported by a prop behind, the shutter tipping automatically and falling to the river-bed when the depth over top exceeds a certain limit. The shutters are raised by means of a windlass from a service bridge or boat. This type of dam is used on the Ohio and Great Kanawha rivers. Shutters are also hinged at the sill and the props released mechanically, and they have been mounted on pivots between supports like flutter-gates.

A dam has been recently built in Germany and covered with an iron cylinder several feet in diameter, which is rolled away in flood time. The Taintor gate has been much used for closing passes and chutes and has been built in sections 20 feet long and for a depth of 10 to 12 feet. This is a sector of a cylinder against the water, the centre of motion and support being below the centre of figure, so that the water pressure shall nearly balance the weight and assist in raising the gate. Some dams have been built for power purposes in which the flood flow is practically controlled by Taintor gates. This practice is not to be commended, for both gates and men sometimes fail to act.

The movable dam is still in the stages of evolution, and there will be many devices before practice is settled.

Rock-fill Dams.— Hydraulic mining on the Pacific slope developed the rock-fill dam, and it has been utilized for irrigation works. Originally this dam consisted of a dump of loose rock in a cañon or other rock-bound site, taking its natural slope down-stream, the upper slope being hand-laid and steeper and faced with red-wood



Castlewood Rock-fill Dam, Denver Land and Water Co.

or other planking and caulked. Later a sheet of metal was substituted for the planking, and the construction was varied by setting the metal sheet vertically in the heart of the dam. The metal sheet was coated and sometimes enclosed in asphaltum concrete. Such dams had an independent spillway.

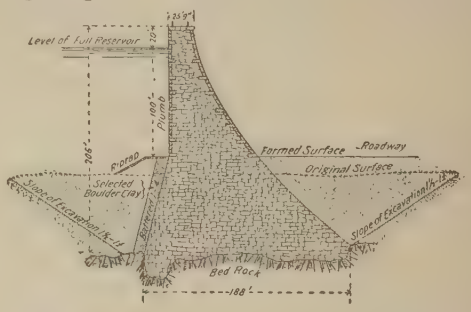
These dams have been carried to considerable heights, several exceeding 100 feet, the highest being the Lower Otay, near San Diego, Cal., 161 feet above rock and 130 feet above natural surface. Settlement has occurred in most of these dams, causing apprehension, but no serious disaster has occurred.

A dam of this character was undertaken in Goose-neck cañon on the South Fork of the South Platte, some 50 miles southwesterly from Denver. In order to avoid settlement, the rock was dropped into place from a height of about 100 feet, as experience in the spoil-banks of the

Chicago Drainage Canal had shown such consolidation from this cause that blasting was resorted to in opening up a roadway across same. The down-stream slope was to be flattened and the hand-laid stone up-stream was to be filled with lean concrete, and faced with a metal sheet. When this dam had reached a height of 50 to 60 feet it was overtopped by an unprecedented flood and washed away. The experiment was valuable in showing that a mound of granite rock thus consolidated was nearly water-tight, under a head of 50 feet of water. (The facing was not carried up.) This experience suggested that a filling of finer material gradating to adobe at the face would have made a successful structure without the intervention of wall or metal sheet. The site was later occupied by a high masonry dam.

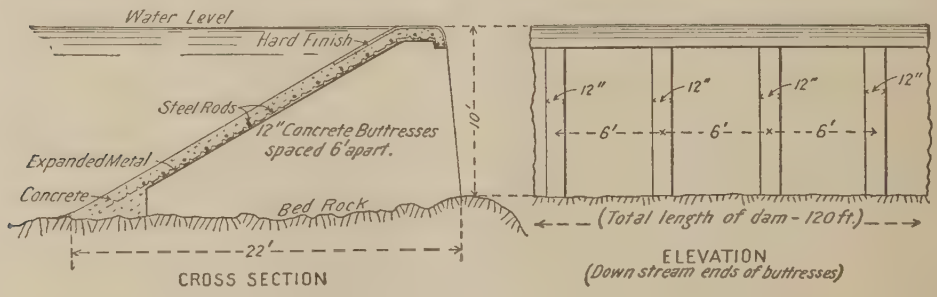
Experience in this class of construction also suggests the flatter slope down-stream and the water-tight skin at the upper face, rather than a core or intercept in the heart of the dam. Dams which depend on a timber or metal sheet for tightness cannot be regarded as permanent structures, and a lack of care in maintenance invites destruction. They are, however, useful expedients in the early development of remote regions.

Metal Dams.—Metal dams are often proposed, and a few examples have been executed in steel. Steel is perhaps more perishable than timber, and its failure from growing weakness and lack of care is likely to be more complete and disastrous. It is adapted to much greater



High Masonry Dam. Cross-section through the Wachusett Dam at the deepest part of the valley. Metropolitan Water Supply, Boston, Mass.

less than a half century ago. The examples are not yet numerous, but the better quality of masonry for hydraulic construction and the greatly reduced cost, together with the more enlightened demand for the conservation of water for irrigation, water-supply, water-power, navigation, and fisheries, combined with the greater security and



Concrete-steel Dam, Theresa, N. Y.

heights, but is to be regarded as an expedient for a few years until something better is justified.

Reinforced Concrete Dams.—Reinforced concrete is growing in favor for many purposes, and it adds an important resource to the art of engineering. It is valuable in flume and bay construction, and in many other features of hydraulic works, and a certain amount of reinforcement can be added near the crest of overfall dams and to avoid checking at critical points.

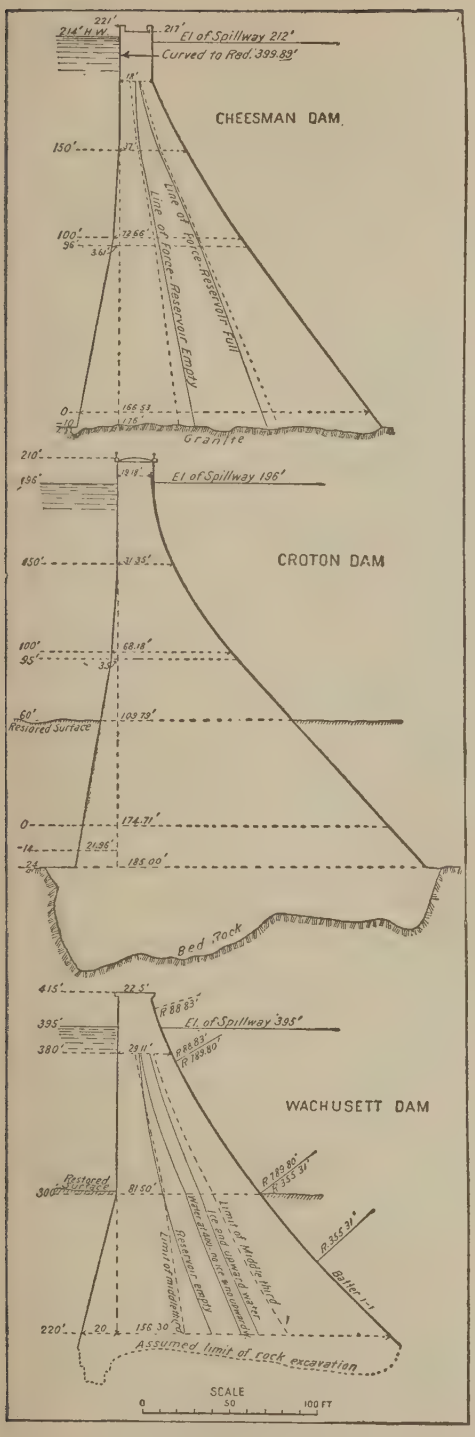
Designs of thin sections that do not depend on their mass for stability are not to be encouraged for the governing features in hydraulic works. In the present state of the art neither materials nor workmanship can be relied upon to give to concrete a definite quality as in metal. The tremor and vibration produced by falling water is a serious matter, and light sections are in the wrong direction and also in greater danger from sympathetic vibration. Dam construction should be in the direction of well-adjusted mass, solidity, and permanence. The consequences of failure are too enormous to make true economy in the saving of mere fractions of cost.

High Masonry Dams.—The high masonry dam is comparatively recent, originating in Spain some three centuries ago, but its rational design began with the Furens dam in France

permanence, promises an era of high masonry dams.

The approved cross-section has a thickness at top of 8 to 10 per cent of the height, a curved batter down-stream and a slightly curved batter up-stream, the conditions being that the locus of strain shall not pass outside the middle third, and that the greatest pressure in the masonry shall not exceed safe working limits, the latter being governed by the quality of the masonry. The construction is massive random rubble work with an avoidance of continuous beds and joints, the up-stream face in courses with roughly dressed beds and joints, the down-stream face of selected stone. The top of the dam is usually finished as a roadway with parapet walls, and the spillway is constructed on an independent location. The site is a rock gorge or cañon with a valley expanse above for the reservoir.

Three notable dams have been recently completed:



Comparative Sections — High Masonry Dams.

The New Croton dam for the water supply of New York city is a straight dam, 291 feet high above the rock, 150 feet above the natural surface and 2,240 feet long on top, and it forms a reservoir with a capacity of 4,270,000,000 cubic feet.

The Wachusett dam for the Boston Metropolitan water supply is also a straight dam, 200 feet above the rock, 125 feet above the natural surface, and 1,500 feet long on top, and it forms a reservoir with a capacity of 8,400,000,000 cubic feet. The section is notable in the allowance made for ice pressure with a full reservoir.

The Cheesman dam for the water supply of Denver is located at Goose-neck Cañon on the South Fork of the South Platte, about 50 miles from Denver, and controls the run-off of some 1,800 square miles, including South Park. This dam is 225 feet above rock and 217 feet above the outlet tunnel and 700 feet long at top. It is built of granite quarried near the site, and produces a reservoir with a capacity of 3,500,000,000 cubic feet. The dam is curved in plan on a radius of 400 feet. The cross-section would be considered slender for a straight dam, but the masonry is of the highest quality and the arch form adds materially to the strength, probably 50 per cent or more. Such curvature also lessens the liability to temperature cracks. The spillway is an independent construction, located in the saddle of the "goose-neck." The water is drawn through tunnels fitted with valves at three levels, joining in a common outlet tunnel. The tunnels are driven through the "goose-neck" between the dam and spillway. The entire site is a granite formation.

The Cheesman dam is notable as carrying the greatest free head of water of any structure in the world. It was completed in the autumn of 1904, and water ran over the spillway on 9 May 1905. A considerably higher dam has been projected in Platte Cañon, below the junction of the two forks, and higher dams are also projected by the Land Reclamation Service.

A very remarkable masonry dam, depending almost wholly on the arch form, is the Bear Valley dam of California. This dam is 60 feet high, 450 long on a radius of 300 feet, and is only 20 feet thick at bottom and 3.17 feet thick at top. It was built in 1884 and still stands, notwithstanding its critics. Such extreme sacrifice of mass to the logic of the strain sheet is doubtful practice, in view of uncertainty in material and in the forces that may some time show up.

The use of concrete in the very heavy sections of high dams is still an open question on account of the absence of positive knowledge as to the continued setting of the concrete in the interior of large masses. Carrying the work up very slowly, or the leaving of numerous "swallow-holes" to be filled later, may obviate this objection. Otherwise the monolithic character of concrete work is a peculiar adaptation.

Adjuncts.— The ordinary dam across a stream is its own spillway. For impounding dams of earth or rock-fill the independent spillway is obvious. It should be equally obvious for the high masonry dam, and this is now recognized by the best practice. Many errors have been made, especially in arid regions, through insufficient spillway. In humid regions the "greatest flood" occurs two or three times in a century, and if these are provided for, the margin is usually sufficient for any contingency. In the arid regions a flood as great may be

possible, but the occurrence is far more erratic. Cloudbursts produce startling effects in small basins, but the results in basins of considerable area are not significant.

The Yellow River of China has a large proportion of arid and semiarid territory, and four times in its history it has devastated its valley, notwithstanding all the defences of man, and changed its lower course to the sea. All the factors in flood flow will sometime conjoin, and a work that is to last through the centuries must recognize all the possibilities.

Adjuncts in the way of gates, sluices, and movable structures are much favored by some designers, especially where they serve to lessen cost. Such provisions should not be carried to a point where their failure to operate or be operated will produce damages amounting to a disaster.

The location of service pipes and outlets through or beneath dams is shown by experience to be a source of danger, and the best practice now seeks an independent location.

The tendency is now to avoid the long race for power purposes, to build the dam at the foot rather than the head of the rapids or descent, and to make the power station and forebays a part of the structure, taking the water directly from the pool.

Outside of the main elements of a structure on which safety and permanency depend, many devices and constructions are permissible, as failure in these result in only temporary loss and inconvenience.

General Remarks.— Dam building is still in the evolutionary stage, and the resources of engineering therefor are still developing. The type structures would seem to be well defined, but every site has its own peculiar conditions, requiring elasticity in treatment, and financial limitations often blight the proper solution. A dam when once built assimilates so closely to natural resources, is so fully identified with the public welfare, and the failure is so disastrous, that its construction becomes a matter of solicitude above that of any other engineering work.

How important a knowledge of these matters may be is illustrated by the question of an interoceanic canal. The treatment of the Nicaragua route was made to turn on the question of a site for a predetermined type of dam, while the plans for Panama are still undetermined, largely by reason of differences upon a similar question. Earthquake conditions in either region are also factors for consideration.

Consulting Engineer, Chicago.

Damsel-fly, sometimes, though rarely, used as a popular name for the common dragon-fly, or mosquito-hawk, of the neuropterous family *Libellulidæ.* Damsel-fly is the English equivalent for the French *demoiselle* (fly) which is applied only to the genus *Agrion.* This is a very small dragon-fly, not half as large as *Libellula.* Its metallic greenish-blue color and slender delicate form produce a beautiful effect in the sunshine, and suggest the name. See DRAGON-FLY.

Damson, a variety of plum (q.v.).

Dan (Heb. "judgment"), one of the sons of Jacob by his concubine Bilhah. Like the other sons of Jacob, Dan became head of one of the 12 tribes of Israel. At the time of the exodus the Danites numbered 62,700 adult males. The territory assigned them in Canaan lay on the coast, but living in the immediate neighborhood of the hardy and well-equipped Philistines — for the district lay partly within the Philistine territory — the available land proved somewhat too narrow for the Danites, and they were pushed back into the more mountainous region,

CHARLES A. DANA.

where they encroached on the boundaries of Judah. The tribe also possessed an isolated portion of territory in the extreme north of Canaan, containing the town of Laish or Dan, which gave rise to the proverbial expression "from Dan to Beersheba." This town was in later times selected by Jeroboam as one of the two centres of his idolatrous worship, but a species of idolatry had been maintained there from the earliest times of the settlement in connection with the image of Micah. The most notable person connected with the tribe was Samson.

Dan River, a river rising in Patrick County, Virginia, flows across the boundary between Virginia and North Carolina a number of times, but finally unites with the Staunton River, at Clarksville, Va., and forms the Roanoke. The river is somewhat less than 200 miles in length, and furnishes valuable water power in its upper part. It is navigable for about 100 miles above the junction with the Staunton River.

Dana, Charles Anderson, American journalist: b. Hinsdale, N. H., 8 Aug. 1819; d. Glen Cove, L. I., 17 Oct. 1897. He was educated at Harvard and in 1842 was a member of the Brook Farm Community, in Roxbury, Mass., remaining there only two years. He edited 'The Harbinger' (1844-7), his associates being George Ripley, Parke Godwin, and John S. Dwight. In 1847 he became managing editor of the New York *Tribune,* with which he remained until 1861. In 1855, with George Ripley, he projected and edited Appleton's 'American Encyclopædia' in 16 volumes, completed in 1863, and revised in 1873–7. He also edited several other works, among them the popular 'Household Book of Poetry' (1857). From 1862 to 1865 he was in the service of the United States government, during the last two years as assistant secretary of war under President Lincoln. About the beginning of 1866 he became editor of the Chicago *Republican,* a daily paper. In 1868 he purchased an interest in the New York *Sun,* also a daily, of which he was editor and chief proprietor until his death. He was a man of forcible character and impressed his personality upon his paper. His literary judgments and perceptions were keen and his own writing exhibited a perfect mastery of English style. Under his management the *Sun* became noted for the literary quality of its editorials. In his later years, however, his intense political partisanship became very marked and greatly diminished the weight of his influence in journalism.

Dana, Charles Loomis, American physician: b. Woodstock, Vt., 25 March 1852. He was graduated from Dartmouth College in 1872, studied medicine and has been professor of nervous diseases in Dartmouth Medical College, and at the medical department of Cornell University. He has published 'Text Book of Nervous Diseases' (1892).

Dana, Edward Salisbury, American mineralogist: b. New Haven, Conn., 16 Nov. 1849. He was graduated from Yale in 1870 and has been a member of the faculty at that institution from 1874, at present (1903) as professor of physics. He has published: 'A Text Book of Mineralogy' (1877); 'Text Book of Mechanics' (1881); 'Minerals, and How to Study Them'; 'Sixth Edition of James D. Dana's System of Mineralogy' (1892).

Dana, Francis, American jurist: b. Charlestown, Mass., 13 June 1743; d. 25 April 1811. He was a son of Richard Dana (q.v.), was graduated at Harvard in 1762, and admitted to the bar in 1767. In 1775 he was sent to Europe on a confidential mission to Benjamin Franklin, carrying letters from Warren, Quincy, and other patriots. He returned the next year and reported to Gen. Washington that the colonies need expect nothing of Great Britain. In 1777 he was elected a member of the Congress that formed the Confederation, and filled various offices during the Revolutionary War. In 1781 he was made minister to Russia, and after his return was again elected to Congress. In November 1791 he was appointed chief-justice of Massachusetts for a term of 15 years.

Dana, Francis, American lawyer and author: b. Singapore, East India, 4 March 1866. He was educated at Saint Paul's School, Concord, N. H., and the Harvard Law School, and besides contributing short stories to periodicals has published 'Lenora of the Yawmish.'

Dana, James Dwight, American naturalist: b. Utica, N. Y., 12 Feb. 1813; d. New Haven, Conn., 14 April 1895. He was graduated at Yale College in 1833; accompanied the American expedition of 1838 to the Southern and Pacific oceans as geologist and mineralogist, and on his return compiled exhaustive reports. In 1835 he became Silliman professor of natural history and geology at Yale, but in 1864 the title was altered to that of professor of geology and mineralogy. Many American and foreign learned bodies conferred distinctions on him. Besides many articles in various journals, he wrote: 'System of Mineralogy' (1837); 'Manual of Mineralogy' (1848); 'Coral Reefs and Islands' (1853); 'Manual of Geology' (1863); 'Text-Book of Geology' (1864); and 'The Geological Story Briefly Told' (1875).

Dana, John Cotton, American librarian: b. Woodstock, Vt., 19 Aug. 1856. He was graduated at Dartmouth College 1878, and admitted to New York bar 1882. He was librarian of the Public Library, Denver, Col., 1889-97; of the City Library Association of Springfield, Mass., 1898–1901, and has since been at the head of the Public Library of Newark, N. J.

Dana, Marvin, American writer: b. Cornwall, Vt., 2 March 1867. He has published: 'Mater Christi and Other Poems'; 'History of Gen. Custer'; 'History of the Mormons'; 'Wars of the Century'; 'Studies in Criminology'; 'A Brief Universal History.'

Dana, Napoleon Jackson Tecumseh, American soldier: b. Eastport, Me., 15 April 1822; d. 15 July 1905. He was graduated from West Point in 1842, served in the Mexican war and in the Civil War also, becoming major-general. He resigned from the army in 1865, later engaged in mining enterprises, and was president of several railroads.

Dana, Paul, American journalist: b. New York 20 Aug. 1852. He is a son of C. A. Dana (q.v.), and was educated at Harvard and the Columbia Law School. He began journalism on his father's paper, the New York *Sun,* and after the latter's death in 1897, was for several years its editor-in-chief.

Dana, Richard, American jurist: b. Cambridge, Mass., 7 July 1699; d. 17 May 1772. He was a grandson of Richard Dana, the first of the family who came from England and settled at Cambridge in 1640. After practising law at Marblehead and Charlestown, he removed to Boston, where he became a leading barrister. He was distinguished for his prominence in the measures of resistance which immediately preceded the American Revolution. Although devoted to his profession and declining office, he was a leading figure in those important political assemblages, where he sometimes presided, the Boston town meetings from 1763 to 1772. It was the custom of Boston in those troubled times to address the country at large on public affairs under the form of published instructions to the representatives of the town. Warren, Hancock, and the Adamses were on committees for this purpose. Dana was always a member, and often at their head. He reported the papers of 20 Nov. 1767, and 8 May 1770, noted at that time. He was a member of the association of the Sons of Liberty, and at their celebrated meeting of 17 Dec. 1769, administered to Secretary Oliver the oath of non-execution of the Stamp Act, and made and signed a solemn official record of that fact, by which he would seem to have exposed himself to the charge of treason under the constructions of those days.

Dana, Richard Henry, the Elder, American poet and essayist: b. Cambridge, Mass., 15 Nov. 1787; d. Boston 2 Feb. 1879. He was a son of Francis Dana (1743-1811 q.v.); studied at Harvard College and was admitted to the Massachusetts bar in 1811. He was connected with the 'North American Review' from its commencement in 1815, and his earliest writings first appeared in that periodical, of which he became joint-editor in 1818. His lectures on Shakespeare's characters, delivered in the principal cities of the Atlantic coast (1839–40), awakened a deep public interest. His principal poems are: 'The Change of Home' (1824); 'The Dying Raven' (1825); 'The Buccaneers' (1827), specially noteworthy for its descriptions of the vicissitudes of ocean scenery. To a periodical publication, 'The Idle Man' (N. Y. 1821–2), of which he was editor, he contributed critical papers and several stories; among them 'Paul Fenton' and 'Edward and Mary.'

Dana, Richard Henry, American jurist and miscellaneous writer: b. Cambridge, Mass., 1 Aug. 1815; d. Rome, Italy, 7 Jan. 1882. He was a son of the preceding. He entered Harvard College in 1832, but compelled on account of an affection of the eyes to suspend his studies in 1834, he undertook a voyage to California in the capacity of a common sailor. This voyage he described in a very interesting book, 'Two Years Before the Mast' (1840, enlarged edition 1869). Returning to college he completed his law course, and was admitted to the Boston bar in 1840, soon securing a large number of admiralty cases. In 1841 he published a treatise on seamanship, 'The Seaman's Friend' (republished in England as 'The Seaman's Manual'), containing a treatise on practical seamanship, a useful dictionary of sea terms, and valuable information on maritime law. In 1859–60 he made a voyage round the world, visiting the Sandwich Islands, China, Japan, Ceylon, India, and Egypt, returning through Europe. In 1861 he was appointed United States attorney for Massachusetts, and was counsel for the United States in the proceedings against Jefferson Davis for treason, in 1867–8. In 1866 he published a copiously annotated edition of Wheaton's 'Elements of International Law.' See Adams, 'Richard Henry Dana: a Biography' (1890).

Dana, Samuel Luther, American chemist: b. Amherst, N. H., 11 July 1795; d. Lowell, Mass., 11 March 1868. For more than a generation he was employed as chemist in the Merrimac Print Works in Lowell, and while there invented a new method of bleaching cotton goods which was very widely adopted.

Dana, William Parsons, American marine artist: b. Boston, Mass., 18 Feb. 1833. He studied in Paris under Picot and Le Poitevin, became a member of the National Academy in 1863 and obtained a third class medal at the Paris Exhibition of 1878 for his 'Gathering Seaweed.' One of his most noted pictures is the 'Chase of the Frigate Constitution,' now on exhibition in a private art gallery in New York city.

Dana, Mrs. William Starr. See PARSONS, FRANCES THEODORA STARR.

Danaë, dăn'ā-ē, in Greek mythology, daughter of Acrisius, king of Argos. She was shut up by her father in a brazen tower, because an oracle had declared that a son of his daughter should put him to death. But Zeus, inflamed with passion for the charming virgin, transformed himself into a golden shower, and descended through the apertures of the roof into her embraces. When Acrisius discovered that his daughter had become a mother he exposed her with her child, in a chest, to the violence of the waves. But the sea-goddesses, anxious for the preservation of the son of Jove, commanded the billows to bear the box safely to Seriphos, one of the Cyclades. Polydectes, or rather Dictys, the governor of the island, received her, and educated the child, which he named Perseus.

Danai. See DANAUS.

Danais, dā'na-īs, a genus belonging to the group *Nymphalidæ* (by some placed in *Papilionidæ*), the largest family of day-flying lepidopterous insects, widely scattered over the globe. *D. erippus* (or *archippus*) is prevalent in all parts of the United States. Its wings are varied with yellow, black, and white bands, and it occurs frequently in summer along country roads, in pastures, and wherever the milkweed, its favorite food, grows. The chrysalis is well known for its beauty of green and gold. The caterpillar is marked with yellow and black bands. *Danais* is a famous globe-traveler, having spread by some unknown means from continents to islands of the ocean, and to Australia. Very beautiful species abound in India. In New Holland it was found that the natives, who called it "bugong moth," valued it highly for food. By means of smothered fires they were able to suffocate and collect the "moths" in large quantities, after which the appendages were removed and the bodies were made into oily cakes.

Danakil, dä-nä-kēl' (singular DANKALI), the Arabic and now general name for the numerous nomad and fisher tribes inhabiting the coast of northeast Africa, from Massowah south to

Tajurrah Bay, and from there southwest to Shoa. They belong to the Ethiopic Hamites, and are well built and slender, with features indicating an intermixture of Arab blood. In a country of waterless plains, they are generally nomads, living partly by caravan traffic and the slave trade, but mostly on the milk of their flocks.

Danao, Philippines, (1) town on the east coast of the island of Cebú, four miles north of Compostela, and 18 miles north of the town of Cebú. The productions of the interior are important for exports, but the anchorage at Danao is not good enough to encourage steamers to load at this port. The road along the coast is in a good condition. Pop. 15,483. (2) Danao, a hamlet, is on the west coast of South Antique, Panay, four miles north of Dao. (3) A lake in West Leyte, south of Panangua crater. (4) A mountain peak on the island of Luzon. (5) A river in the northeast of Negros Occidental, rising in the crater of Solitario, flows east into a small bay, on the north shore of which is situated Escalante.

Dan'aus, in Greek mythology, the son of Belus and twin-brother of Ægyptus, originally ruler of Libya. Fearing his brother, he fled to Argos, with his 50 daughters, the Danaïdes, and here he was chosen king, in place of Gelanor. The 50 sons of Ægyptus followed him, and under the pretence of friendship, sought the hands of his daughters in marriage. Danaus consented, but on the bridal night he gave his daughters each a dagger, and urged them to murder their bridegrooms in revenge for the treatment he had received from Ægyptus. All did so, except one, Hypermnestra, who allowed her husband, Lynceus, to escape. The fable states that in the under-world the Danaïdes were compelled, as a punishment for their crimes, to pour water for ever into a vessel full of holes. From Danaus, the Argives were called Danai.

Dan'bury, Conn., city and one of the county-seats of Fairfield County; on the New England, and the New York, New Haven & Hartford railroads; 62 miles northeast of New York. It is the greatest hat-making city in the United States, with nearly 30 factories in operation. It has also extensive manufactures of iron, brass, and silverplated ware, bicycles, paper, and foundry and machine shop products. There are a court-house, public library, high school, public parks, electric street railways and lights, soldiers' monument, two national banks, daily and weekly newspapers, and excellent public and private schools. A temporary settlement was made here in 1684, a meeting-house was erected in 1696, and for many years the place was known by the Indian name of Paliquioque. In 1776 the place was made a depository for army stores, and when Gen. Tryon, the British governor of New York, was informed of the fact he headed a force of over 2,000 men, landed at Norwalk, marched immediately upon Danbury, and set fire to the town and stores. Hat-making was begun here in 1780. Pop. (1900) 16,537.

Danby, Francis, Irish painter: b. Wexford, Ireland, 16 Nov. 1793; d. Exmouth, Devonshire, England, 17 Feb. 1861. He studied at the Dublin Academy of Fine Arts, and sent to its exhibition his first picture in 1812. In 1820 he settled at Bristol, established his reputation in 1823 by his 'Sunset at Sea After a Storm'; and in 1825, by his 'Delivery of Israel out of Egypt,' obtained the honor of being admitted as an associate of the Academy. Among his subsequent pictures the most celebrated are the 'Opening of the Sixth Seal' (1828); the 'Age of Gold' (1831); 'The Enchanted Island — Sunset' (1841); 'The Contest of the Lyre and Pipe in the Vale of Tempe' (1842); and the 'Painter's Holiday' (1844). Danby's excellence lay in his delineations of scenery, and the poetic halo with which he contrived to invest them.

Danby, Thomas Osborne, Duke of Leeds; English statesman: b. 1631; d. 26 July 1712. A favorite of Charles II., he became lord treasurer in 1673 and was made Earl of Danby the next year. He was instrumental in bringing about the marriage of the Duke of York's daughter, Mary, to the Prince of Orange, and on the accession of William III. was appointed president of the council, and in 1694 was created Duke of Leeds.

Dance of Death, a grotesque allegorical representation in which the figure of Death under various forms takes the lead, followed by dancers of all ages and conditions. It was frequently drawn by artists of the Middle Ages for cemeteries and cloisters. These representations were common in Germany, and also in France, where they received the name of *Danse Macabre.* This term is supposed by some to be derived from the Arabic *magbarah,* a cemetery, but much more probably from the *Chorea Machabæorum,* or dance of the Maccabees, a kind of dramatic representation performed in the Middle Ages, in which the seven martyred brothers mentioned in the second book of Maccabees (Apocrypha) would appear to have been introduced. A Dance of Death was painted on the walls of the churchyard of the Innocents at Paris, about the middle of the 15th century, which the chapter of St. Paul's in London caused to be copied, to adorn the walls of its monastery. Gabriel Peignot, in the 'Recherches sur les Danses des Morts et sur l'Origine des Cartes á jouer' (Dijon and Paris 1826), investigated the origin of the Dance of Death in France, and explained the dancing positions of the skeletons, by the fact which old chronicles relate, that those who were attacked by the plague ran from their houses, making violent efforts to restore their rapidly declining strength by all kinds of morbid movements. The most remarkable Dance of Death was painted, in fresco, on the walls of the churchyard in the suburb of St. John at Basel, which was injured, in early times, by being washed over, and is now entirely destroyed. This piece has been ascribed to the celebrated Hans Holbein; but it has long since been proved that it existed 60 years before his birth. It was painted at Basel in the year 1431, by an unknown artist, in commemoration of the plague, which prevailed there at that time. It represented Death as summoning to the dance persons of all ranks, from the Pope and the emperor down to the beggar, and was explained by edifying rhymes. That piece contained about 60 figures as large as life. Besides being ascribed to Holbein, as was before stated, it has also been ascribed to a painter named Glauber, but without foundation. Holbein perhaps conceived, from this picture, the idea of his Dance of Death, the original drawings of which are at St. Petersburg. Very fine

engravings of these are in the 'Œuvres de Jean Holbein, par Chrét. de Méchel' (Vol I., Basel 1780).

Dance, St. Vitus. See CHOREA.

Dancing, a form of exercise or amusement in which one or more persons make a series of graceful movements in measured steps in accord with music. Aristotle ranked dancing with poetry, and Pindar applies the name of "The Dancer" even to Apollo. Dancing corresponds to a universal primitive instinct in man, and is practised by the South Sea Islanders, the Forest Indians of Brazil, the Zulus, the negroes of central Africa, and the native Australians, exactly as it was in the earlier stages of every civilized modern race. Ferocious war-dances were practised by savage warriors, as the North American Indian braves, who brought on a frantic mechanical intoxication capable of carrying them to victory. The Zulu war-dance is a noble exercise for warriors, like the Pyrrhic dance of the ancient Spartans; and the dancing and spinning dervishes in the East, who work themselves into spasms of physical excitement, are still highly esteemed for devoutness and piety. The idea of magic always enters into savage dancing. Thus, the Mandan Indians dance the buffalo-dance to bring game when supplies of food are low. The rain doctors of central Africa dance mystic dances to bring rain; and the wives of the Gold Coast negroes dance a battle-dance to give their absent husbands courage in battle.

The art of dancing dates back to the early Egyptians, who ascribe that invention to their god, Thoth. Among the ancient Jews, Miriam danced to a sound of trumpets, itself an act of worship, and David danced in procession before the Ark of God. Religious processions went with song and dance to the temples; the Cretan chorus moving in measured pace sang hymns to the Greek god, Apollo, and one of the Muses (Terpsichore) was the special patroness of the art. The Phrygian Corybantes danced in honor of Cybele, and the festivals of Rhea Silvia at Rome were also accompanied with wild dances, while during the early festival of Mars the Salian priests sang and danced, beating their shields. The Spartans practised dancing as a gymnastic exercise and made it compulsory on all children from the age of five. The Romans in general considered it disgraceful for a free citizen to dance except in connection with religious rites, but willingly witnessed the performances of professional dancers like the Almé of modern Egypt, and the Bayadéres, or Nautch girls, of India. The early Christians practised choral dances, which came into discredit with the love-feasts or Agapæ. A survival of religious dancing is still seen even within the pale of Christendom, where during the Corpus Christi octave a ballet is danced every evening by boys from 12 to 17 years of age, wearing plumed hats and in the dress of pages of Philip III.'s time.

The Puritan ancestors saw deadly sin in promiscuous dancing. Father Mariana tells us that the famous saraband worked more mischief than the plague. The fandango was hotly condemned by the clergy, but when danced before the Sacred College, who wished to see it before prohibiting it, so charmed the judges that they gave it their unanimous approval. Many of the mediæval dances were solemn and stately in character like the *danses basses,* which were danced to psalm tunes at the court of Charles IX. of France. It is said that the whole august Council of Trent danced at a ball given in 1562 to King Philip II. of Spain. The *Galliarde* and *volta* were introduced into France from Italy by Catharine de Medici. Dancing reached its height during the reign of Louis XIV., who was himself an enthusiastic dancer in the court ballets.

The minuet was a favorite in France for a century; and then came the quadrille or *contre-danse,* often connected erroneously with the English country-dance; the Écossaise was first introduced in 1760; the galop was introduced from Germany; the cotillion was fashionable under Charles X.; polka was first danced at the Odéon in 1840 by a dancing master from Prague; the polka tremblante or schottisch, was of Bohemian origin and was first brought out in Paris in 1844; the lancers was introduced by Laborde in 1861; and the waltz, originally Bavarian, and now modified from its original form, promises to retain its supremacy.

Characteristic of particular races or merely of classes of people are such forms of the dance as the Scotch reel, Highland fling, and strathspey, the Irish jig, the negro break-downs, sailors' hornpipe, step-dances, the can-can, morris dances, etc.

A ballet is a theatrical exhibition composed of dancing, posturing, and pantomimic action. The Roman pantomimes bore a strong resemblance to the modern *ballet d'action.* In an entertainment given to celebrate the victory of Actium, the "Trachiniæ" of Sophocles, and an erotic interlude founded on the myth of Leda, were performed in dumb show, the dancers Pylades and Bathyllus taking the leading parts; and the whole wound up with a Pyrrhic war-dance. Some tradition of this form of entertainment, doubtless, suggested the courtly dances which became fashionable in the early days of the Renaissance. The first on record was that given by Bergonzio di Botta, at Tortona, to celebrate the marriage of the Duke of Milan in 1489. This was famous throughout the civilized world. From that time great events, such as royal marriages and births, were celebrated by grand productions of ballet on which enormous sums of money were lavished. These ballets were frequently historical in subject, treating of the siege of Troy, the conquests of Alexander, and similar events. There were also mythological, poetical, moral, and fantastic ballets, on such subjects as the Judgment of Paris, the Seasons, Truth, the Diversions of the Carnival, etc. All these were in five acts, each of which consisted of 3, 6, 9, or 12 entries, and in all of them singing and recitation mingled with the dancing.

Catharine de Medici introduced the ballet into France, and encouraged dances by females that would now be deemed highly improper, to distract the attention of her son, Henry III., from state affairs. Henry IV. was a great supporter of the ballet, no fewer than 80 grand entertainments being given by him between 1589 and 1610. Louis XIII. and Louis XIV. carried their love of ballet to an extreme length, and themselves danced publicly. In 1661 the latter founded an Academy of the Dance, with Quinault as director, and Lully as composer. It was not until 1681 that female dancers appeared in

public, the first being four ladies, who danced "La Triomphe de l'Amour." In the early part of the 18th century the names of professional dancers began to appear, two of the most famous being Mlles. Salle and Camargo, immortalized by Voltaire. The great male dancer of this time was Dupré, the predecessor of the universally known Gaetano Vestris.

In 1697 De la Motte introduced more changes into the ballet, chiefly in the direction of more interesting subjects, and about the same time comic ballets were invented by Danchet; but no important alterations were made till the advent of Jean Georges Noverre in 1749. The dancers wore masks, huge wigs, and headdresses, and hoops. The mask finally disappeared in 1773. Hitherto the form of the ballet had remained practically unchanged, each act being performed by different dancers, and generally in different styles of dancing. Noverre invented the *ballet d'action*, and revived the art of pantomime. Dancing now had dramatic meaning, and the most intricate plots were represented by pantomime alone. The principles of Noverre were carried to great perfection by Vincenzo Galleotti in Copenhagen, and by his successor, Bournonville. Under the Directory a form of grand ballet was revived, in which patriotic songs were a feature.

The history of the ballet since Noverre's time is a history of dancers rather than of dancing. In England, this class of entertainment was never more than an exotic, and has practically no history. The word *balette* is first used in English by Dryden (1667), and the earliest attempt at a descriptive ballet seems to have been 'The Tavern Bilkers,' played at Drury Lane in 1702. Within the last few years an important revival of the ballet has taken place in Italy, where the famous "Excelsior," by the Chevalier Luigi Manzotti, Messalina, Amor, etc., have furnished magnificent examples of the *ballet d'action*.

Skirt-dancing, so called on account of the voluminous skirts made of sheer or flimsy material, which are worn by the dancers and play so important a part in their dances, has become a science and a popular attraction on the stage. The dancers, by the clever manipulation of their draperies and assisted by light effects, assume such forms as flowers; the rose, calla lily, pansies, pinks; butterflies of different colors, and flags of various nationalities; all to the accompaniment of music. Among the most noted skirt dancers were Amelia Glover, Loïe Fuller, the inventor of the serpentine dance, Papinta, and Anna Held.

DANIEL FROHMAN.

Dancing Disease, an epidemic nervous disorder, apparently allied to hysteria and chorea, occasionally prevalent in Germany and Italy during the Middle Ages. In the last-mentioned country the disease was ascribed to the bite of a spider called the tarantula; but as scarcely any of those affected with it had any consciousness of being bitten by a spider or any other insect, and as it has been in every instance chiefly propagated by physical contagion, like chorea, there is every reason to conclude that it had a like origin. In 1734, during the celebration of the festival of St. John, at Aix-la-Chapelle, the streets became crowded with men and women, of all ranks and ages, who commenced dancing in a wild and frantic manner, many losing entire control over themselves, and continuing to dance until dropping down from fatigue, and some, in a moment of frenzy, dashing out their brains against walls. The mania spread to Cologne, Metz, and Strasburg, and gave rise to much imposture, profligacy, and disorder. At the beginning of the 17th century the epidemic began to decline; and is only known now as a nervous affection in individual cases.

Dancing Faun, a frolicsome sylvan creature, half-human, half-goat, corresponding to the Greek Satyr, only gayer and less hideous than his woodland brother; often used in ancient comedy as the very embodiment of humor and mischief. Poets, painters, and sculptors of every age have loved to depict the faun in the madness of dancing.

> Rough Satyrs danced and Fauns with cloven heel
> From the glad sound would not be absent long.
> Milton, Lycidas, i. 34.

Dancla, Jean Baptiste Charles, zhŏñ bäp-tēst shärl dän-klä, French musical composer and violinist: b. Bagnères de Bigorre 19 Dec. 1818. He was a pupil at the Conservatory of Paris, where he took the first prize for the violin in 1833, at the age of 15, becoming professor there in 1857. He displayed remarkable fecundity as a composer, among his works being: a 'Method of the Violin,' studies, sonatas, solos, fantasies, and airs for that instrument; symphonies, trios, and quartettes for stringed instruments; 'Christopher Columbus,' a dramatic scene for an orchestra; a volume of 'Notes and Souvenirs' (1893).

Dancourt, däñ-koor, **Florent Carton,** French actor and playwright: b. Fontainebleau 1 Nov. 1661; d. Courcelles-le-Roi, France, 6 Dec. 1725. Although he personated the first characters in high comedy, he succeeded best as an author in low comedy. He displayed much ingenuity and wit in introducing upon the stage amusing subjects of real occurrence in his time. Louis XIV. was very fond of humorous pieces, and Dancourt often used to read his productions to the king before they were played. Among his dramas are: 'Le Chevalier à la Mode' (1687); 'Les bourgeoises de qualité' (1700); 'Les trois cousins' (1700).

Dandelion, the common and well-known plant, *Taraxacum officinale,* belonging to the chicory family. It yields a milky juice, which in the form of extract is used medicinally as a diuretic and alterative. It contains a bitter crystalline principle called taraxacin. Its root has been used to adulterate coffee in a similar way to chicory, and is used to adulterate chicory itself. The blanched leaves are eaten as a salad. In America it is a common article of food in the spring of the year, boiled and eaten as "greens." It has a naked, hollow stalk, with a single bright yellow flower. The seed is furnished with a fine white pappus, by means of which it is carried far and wide by the wind. The leaves are lanceolate and sinuous, rising from a taproot in the form of a rosette. The plant is probably native in certain parts of America, but is found as a weed in all parts of the civilized world.

Dandie Dinmont, a small terrier, 8 to 11 inches high at the shoulder, and bred chiefly in Scotland as a pet. It is generally bluish-gray, or tan in color; its coat is soft and silky; and its eyes are a soft hazel. It is a gentle and affec-

tionate little creature, and has become celebrated in literature through the writings of Sir Walter Scott, one of whose favorite dogs was among the earliest of this breed.

Dandolo, Andrea, än-drā'ä dän'dō-lō, Doge of Venice and Italian historian: b. about 1310; d. September 1354; and made doge in 1343. He carried on a war against the Turks with various success, and greatly extended Venetian commerce by opening a trading connection with Egypt. The jealousy entertained by the Genoese of this new trade produced a war between the two states, which gave rise to a correspondence between the doge and Petrarch, who exhorted him to peace. To Andrea Dandolo is ascribed the compilation of the sixth book of Venetian statutes; but he is most distinguished for his 'Chronicle of Venice,' written in Latin, and comprehending the history of the republic from its commencement to 1342. It is praised for its impartiality, and for its judicious use of authentic documents, and was first published by Muratori in his collection of original Italian historians.

Dandolo, Enrico, ĕn-rē'kō, Doge of Venice: b. Venice about 1108; d. Constantinople 14 June 1205. He was chosen to office in 1192, at the advanced age of 84. He had a defect of sight approaching nearly to blindness; but neither that circumstance nor his age impaired the vigor of his administration, the events of his government being among the principal causes of the Venetian greatness. On the formation of the league for the fourth Crusade, under Baldwin, Earl of Flanders, Dandolo induced the senate to join in it, and by his policy the first hostilities of the armament were directed against Zara, which had revolted from Venice. On the storming of Constantinople, the aged doge, it is said, was the first who mounted the walls. On the Crusaders proceeding to the election of a new emperor of the city Dandolo was first nominated; but in consequence of his age, and the incompatible character of doge, he declined, and the choice ultimately fell on Baldwin. In the sharing of the imperial dominions Venice obtained a full moiety, and Dandolo was solemnly invested with the title of Despot of Romania.

Dan'druff, a condition of scaliness in the head, attended with desquamation or scaling of the superficial layers of epidermis. It may simply indicate a dry and unhealthy skin, or it may be the result of several distinct skin diseases, chief of which is pityriasis. There is usually a slight amount of itching, and on scratching the head large quantities of minute scales are detached and fall on the clothing. Dandruff also occurs from seborrhœa, in which case it is due more to a mild inflammation of the fat follicles of the skin. The sebaceous matter from the glands dries and forms scales. One of the general results arising from dandruff is a gradual loss of hair. The treatment consists in better hygiene of the head, shampoos, and careful stimulation by appropriate tonics. Many of the so-called hair tonics are valueless. Vigorous rubbing of the scalp, with periodical shampooing, is one of the best means of combating this condition, but medical advice should always be sought as to the exact cause of the dandruff. See HAIR.

Dane, Nathan, American jurist: b. Ipswich, Mass., 27 Dec. 1752; d. Beverly 15 Feb. 1835. He was graduated from Harvard in 1778, studied law in Salem, Mass., and began practising in the adjoining town of Beverly in 1782, where he resided until his death. He was among the most eminent lawyers in New England, and was at various times a member of the State legislature. In 1812 he was chosen an elector of President of the United States; in 1814 he was a member of the Hartford convention; and in 1820 he was chosen a member of the convention for revising the constitution of Massachusetts. While he was a delegate from Massachusetts to the Continental Congress in 1786, the best method of providing for the government of the vast territory owned by the Confederacy north and west of the Ohio River came into consideration. It was determined to do this by an ordinance which should establish with much detail not only the foundation of that government, but the leading principles which should prevail in the systems of law and public policy to be in force there. The drafting of this instrument was intrusted to Dane; and it was adopted by Congress without a single alteration, 13 July 1787. The clause in it which has been the subject of most frequent and emphatic remark is that which provides "that there shall be neither slavery nor involuntary servitude in the said territory." The name of the "Northwest Territory" was given to it; and it comprehended all the territory at that time belonging to the Confederacy northwest of the Ohio. Not long before his death, he stated in conversation that not until this ordinance was on the eve of enactment did the thought occur to him of inserting in it this clause respecting slavery. He incorporated in this ordinance a prohibition against all laws impairing the obligation of contracts, which the convention that formed the Constitution of the United States, a few months afterward, extended to all the States of the Union, by making it a part of that Constitution. His 'Abridgment and Digest of American Law' appeared 1823–9. In 1829 he imparted new vigor and life to the law school in Harvard University, in Cambridge, by giving $10,000 (adding $5,000 more in 1831) for the foundation of the Dane professorship of law.

Dane, The Great, one of the breed of large close-haired dogs, originating in Denmark. It is very powerful and intelligent, and is esteemed by sportsmen as a perfect boarhound. These huge dogs resemble the type of the ancient war-dogs. The minimum height of a typical Great Dane is 30 inches and the weight 100 pounds. The body is compact and long; the ears small; eyes small and deep-set. The colors vary, running through gray, mouse-color, white, fawn, red, etc., and sometimes present patches or stripes.

Danebrog, dän'ĕ brŏg, the Danish national flag (*brog* simply meaning cloth), which was carried at the head of the army, like the oriflamme of France. It is red with a white cross in the centre, and, as the legend has it, fell from heaven, as an omen of victory, when the pious Danes under Waldemar II. were besieging the pagan town of Reval. In memory of this auspicious event the king founded the order of the Danebrog, which fell into abeyance, however, at a later period. In 1671, under Christian V., and again under Frederick VI., it was revived. It may be conferred upon all ranks, and may be awarded for military or civil services. The dec-

oration consists of a white enameled gold cross, suspended by a white ribbon with a red border.

Danegeld, dān'gĕlt, or **Danegelt** (A.-S. *Dene,* Danes; *gild, geld,* payment), an ancient annual tax of the Anglo-Saxons, to maintain forces to resist the Danes. It was first paid in 991, when Ethelred purchased the retreat of the invaders, which had reached as far as Maldon. The tax was continued until the time of Stephen, as one of the rights of the crown.

Danelagh, dān'lâ, the ancient name of a strip of territory extending along the east coast of England from the Thames to the Tweed, ceded by Alfred the Great to Guthrun, king of the Danes, after the battle of Ethandune. This name (Danelagh or Dane-law) it retained till the Norman conquest, and its inhabitants were governed by a modification of Danish law and not by English law. King Canute, to prevent any changes in the laws, had them gathered together and taught to the people.

Danenhower, dā'nĕn-how-ẽr, **John Wilson,** American Arctic explorer: b. Chicago, Ill., 30 Sept. 1849; d. Annapolis, Md., 20 April 1887. He was graduated at the United States Naval Academy in 1870, and took part in a surveying expedition to the northern Pacific on the Portsmouth. He joined the Jeannette expedition, which started from Havre, France, went to San Francisco, and thence sailed, 8 July 1879, for the Arctic Ocean, via Bering Strait. The vessel was lost in the ice and the crew after dragging their boats over the frozen deep for 95 days, reached the open sea. A terrible storm separated the boats and none ever was heard of except the one in which Lieut. Danenhower had embarked. It reached Lena Delta, 17 Sept. 1881, and he arrived in the United States in June 1882. He wrote 'The Narrative of the Jeannette.'

Daneo, Giovanni, jō-vän'nē dä-nā'ō, Italian dramatist: b. St. Rémy, Piedmont, 16 May 1824. He wrote some dramas of very considerable merit: 'Suleika'; 'Elisa di Montalpino'; also novels: 'Memoirs of a Gentleman' and 'The Castle of Bardespina.' His poetical works consist of two volumes of miscellaneous 'Poems' and 'Verses,' with 'Gotama' and 'Rafaëllo Sanzio Temosforo.)

Danes, the natives of Denmark. The first mention of them was early in the 6th century, when they were living on the west coast of the Cimbrian Peninsula, whither they had gone from Scandinavia. Their written literature dates from the 13th century, but ancient runic inscriptions in the old Danish language have been found which date from the Viking age (700–1050). The folk-lore and legends that were transmitted from one generation to another, before printing was invented, are valuable contributions to the literature of the present. There are three separate dialects spoken which are represented by the people of Sweden, Zealand, and Jutland. The Zealand dialect became the literary form about the time of the Reformation, from which period modern Danish dates.

Danes Island, a place made noted by Andrée, the Arctic explorer, who, on 11 July 1897, started from this island on his fatal polar expedition. It is a small island off the coast of the Spitzbergen group and on the northwest.

Danewerk, dä'nĕ-vĕrk (Danes' work), an ancient wall from 30 to 40 feet high and of an equal thickness, constructed of earth, stone, and wood, about the middle of the 10th century, seemingly as a protection against the Saxons. It extended along the southern frontier of Schleswig for a distance of nearly 10 miles, and being defended by a series of forts the Danes relied upon it to check the approach of the German troops during the Schleswig-Holstein war of 1864. It was soon discovered that their army was too weak for the defense of so extensive a line, and the position was abandoned. The wall was soon after leveled to the ground.

Danforth, Moseley Isaac, American engraver: b. Hartford, Conn., 1800; d. 1862. He assisted in the founding of the National Academy of Design, spent 10 years in London, in which period he made some noted drawings of the Elgin Marbles, and returning to the United States devoted his attention mainly to the engraving of bank notes.

Danhauser, Joseph, yō'sĕf dän'how-zẽr, Austrian painter: b. Vienna 18 Aug. 1805; d. 4 May 1845. He turned his attention at first to historical painting, and living for some time at Venice, fell under the influence of the works of Titian and Paolo Veronese, and followed religious painting for a while, later becoming a genre painter, which better suited his talent. Among his historical pictures is 'Etienne the Fortunate Offering the Crown of Hungary to the Virgin' (1832). An altar piece in the cathedral at Erlau, representing the martyrdom of St. John, and an 'Abraham Driving Away Hagar and Ishmael' are noted among his religious pictures. He is perhaps best known by his humorous scenes depicting the manners and customs of Austrian life. Of these there are several in the Imperial Museum at Vienna. Many of his works have been popularized by engraving, such as: 'Cured without knowing it'; 'The Oculist'; 'The Prodigal'; 'Reading the Will'; 'Soup at the Convent'; 'Wine, Women, and Song'; 'Judge and Lawyer'; and 'The Evening Festival,' his last work.

Daniel, Hebrew prophet. He was a contemporary of Ezekiel, and was born of a distinguished Hebrew family. In his youth 600 B.C. he was carried captive to Babylon, and educated in the Babylonish court for the service of King Nebuchadnezzar. After three years he entered into the service of this monarch and discharged his employments with much credit to himself and without violating his conscience. A decree of the king which he could not conscientiously obey occasioned his being thrown into the lions' den. Preserved by a miraculous providence he was subsequently elevated to the office of governor and prime minister in the court of the Persian king Darius. Cyrus finally gave him permission to return with his people to Palestine. He ranks with what are called the "greater," in contradistinction to the 12 "minor" prophets. See DANIEL, BOOK OF.

Daniel, Anthony, French Jesuit missionary in North America: b. Dieppe 1601; d. 4 July 1648. In company with the Sieur de Champlain he came to Quebec in 1633 and was soon after transferred to the mission among the Huron Indians. He was shot during an attack upon the town of Saint Joseph by a band of hostile Iroquois.

Daniel, John Moncure, American journalist: b. Virginia, 1825; d. 1865. He became a member of the staff of the Richmond *Examiner* in which capacity his free speech obliged him to engage in several duels. He was appointed minister to Sardinia in 1853, but his indiscreet action in several matters seriously impaired his influence as a diplomatist. During the Civil War he served in the Confederate army for a time, but resuming his editorship of the *Examiner* attacked in its columns the president and treasurer of the Confederacy, and in consequence was obliged to fight a duel with the latter.

Daniel, John Warwick, American politician: b. Lynchburg, Va., 5 Sept. 1842. He served in the Confederate army during the Civil War; subsequently studied law and entered upon the practice of his profession. He was a member of both Houses of the Virginia legislature 1866–72 and 1875–81; and was defeated for governor of his State in 1881. He was a member of Congress 1885–7; entered the national Senate in the year last named and was re-elected at the expiration of his term. He has published 'Attachments Under the Code of Virginia'; 'Negotiable Instruments,' etc.

Daniel, Samuel, English historian and poet: b. Taunton, England, 1562; d. Beckington, Somerset, 14 Oct. 1619. As an historical poet Lucan seems to have been his pattern. He bestowed much labor on the poem which describes, in eight books, the civil wars between the houses of York and Lancaster, 'History of the Civil Wars between the Houses of York and Lancaster.' Daniel contributed much to the improvement of the poetical diction of England. His stanzas, formed with a careful attention to the Italian octave, have more dignity and euphony than most verses of this sort in English literature in the first half of the 17th century. He is not wanting in rhetorical beauty and force. He was also the author of some poetical epistles, pastorals, 57 sonnets, and a few tragedies. The first seem to have excited much attention. During the reign of Queen Elizabeth he wrote a sketch of the history of England till the time of Edward III.— a work learned and clear, without ostentation, and containing useful and acute views.

Daniel, Book of, an important canonical book of the Old Testament. It stands in our Bible, as well as in the LXX. and Vulgate, immediately after Ezekiel, while in the Hebrew canon it is not included in the collection of the Prophets, but appears among the miscellaneous 'Writings.' Delitzsch points out that the book nowhere claims to be written by Daniel, and that its position in the canon shows that it is not properly a prophetic book, but an apocalypse. It is written partly in Hebrew, partly in Aramaic, but forms a coherent whole, which is now divided into 12 chapters, the first half consisting of narrative, the second half of predictions. These predictions are not prophetic speeches like those of the other prophetic scriptures, rebuking the sins of contemporaries, foretelling judgment on the impenitent, and promising Messianic salvation to the repentant and believing; they are minutely detailed apocalyptic visions embracing the history of four successive world-empires — the Chaldæan, the Median, the Persian, and the Greco-Macedonian — culminating in the establishment of the eternal kingdom of the saints of the Most High. Objections to the Danielic authorship of the book were made by the Neoplatonist Porphyry as early as the 3rd century A.D., but first found support in the critical investigations of Bertholdt (1806–8), followed by those of Bleek, De Wette, Langerke, Ewald, Lücke, and others. These investigations have led to the view that the book was not written till the time of the religious persecution of Antiochus Epiphanes, about 168–5 B.C. But the book is certainly of great importance, and "has exercised," says Schürer, "a profound influence upon the form of the Messianic idea. . . . In this book (xii. 2) the hope in a resurrection of the body is for the first time plainly and decidedly expressed. The Messianic hope is here the hope of a glorious future for the nation, but with the double modification that the future kingdom of Israel is conceived of as a universal kingdom and that all the saints who have died will share in it." According to Delitzsch, our Lord's testimony in Matt. xxiv. 15 proves "that Dan. ix. 26, et seq., is a prophecy of the desecration of the temple in the Roman war, not that it is a prophecy then fulfilled for the first time." See Hilgenfeld, 'Die Jüdische Apokalyptik' (1857); and the special commentaries by Hitzig (1850), Auberlen (3d ed. 1874), Hilgenfeld (1863), Caspari (1869), Pusey (1864), Desprez (1879), and Robinson (1882).

Daniel Deronda, George Eliot's last novel, considered by some critics her greatest work. Deronda was brought up in ignorance of his Jewish parentage, but ultimately cast in his lot with his own people. The influence of Deronda remolds the character of the heroine, Gwendolen Harleth, who is unhappily married to Grandcourt. In 'Daniel Deronda' George Eliot had three objects in view: (1) To show the influence of heredity; (2) to show that ideals and sentiments lie at the basis of religion; (3) to contrast a social life founded on tradition (that of the Jews) with mere individualism. The novel was first published as a whole in 1877.

Daniell, John Frederic, English scientist: b. London 12 March 1790; d. 13 March 1845. He was elected a Fellow of the Royal Society in 1814, and devoted himself to chemistry and meteorology. In 1823 he published his 'Meteorological Essays'; and in 1831 was appointed professor of chemistry in King's College, London; and in 1839 published his 'Introduction to Chemical Philosophy.' In 1843 he received the degree of D.C.L. from the University of Oxford, and obtained all the three medals in the gift of the Royal Society. He invented a hygrometer (1820), and a new pyrometer (1830), as well as the electric battery known by his name; and he wrote many valuable papers on chemistry, especially on voltaic combinations and electrolysis.

Daniell, Samuel, English artist and traveler: b. London 1777; d. Ceylon 1811. He was a brother of William Daniell (q.v.). He spent three years at the Cape of Good Hope, and afterward proceeded to the interior of Africa, making sketches of the scenery and people, which he brought home with him to England in 1804, when they were published, with an account of the animals of southern Africa. He afterward went to the island of Ceylon, and during a residence of six years collected a large amount of similar materials, one volume of which was

published, with a description of that country and its inhabitants, in 1808.

Daniell, Thomas, English landscape painter and engraver: b. 1749; d. London 1840. In company with his nephew, William Daniell (q.v.), he made an extraordinary journey through India, for the purpose of preparing sketches and illustrations of the scenery, which were afterward published with the title 'Oriental Scenery' (1808). He was originally a heraldry painter, and became Fellow of the Royal, Asiatic, and Antiquarian societies. He published also 'Views in Egypt'; 'Hindu Excavations at Ellora'; 'Picturesque Voyage to China by Way of India' (1817).

Daniell, William, English painter and engraver: b. 1769; d. 1837. He set out at the age of 14, in company with his uncle, Thomas Daniell (q.v.), upon an artistic exploration of the peninsula of Hindustan. They began their journey at Cape Comorin, and sketched almost every thing beautiful or interesting in the country between that point and Serinagur, in the Himalaya Mountains. They were occupied 10 years in this undertaking. Of their immense number of sketches, they selected and published a portion in a great work entitled 'Oriental Scenery' (1808). William also published 'A Picturesque Voyage to India'; 'Zoography'; 'Animated Nature', etc., and from 1814 to 1825 was engaged in making sketches for 'A Voyage round Great Britain.'

Daniels, Cora Linn, American author: b. Lowell, Mass., 17 March 1852; married Joseph H. Daniels 1874. She has written much for the press and has published in book form: 'Sardia' (1892); 'As it is To Be: Psychical Philosophy' (1892–1900); 'The Nurse'; 'Omar Khayyam'; 'The Bronze Buddha' (1899); 'Encyclopedia of Superstitions of the World' (1901).

Daniels, Frank, American actor: b. Dayton, Ohio, 1860. He was educated in Boston, Mass., and made his appearance on the stage there in 1883. His first success was in 'A Rag Baby' and he has since acted in many farces and light operas.

Daniels, William Haven, American prose writer: b. Franklin, Mass., 18 May 1836. He was for some years in the Methodist ministry. He has published: 'That Boy: Who Shall Have Him?' (1878); 'The Temperance Reform and Its Great Reformers' (1878); 'Moody, His Words, Work, and Workers' (1879); 'Illustrated History of Methodism in the United States' (1880); 'A Short History of the People Called Methodist' (1882).

Danites, dăn'īts, a former secret society of the Mormon Church, for militant action against its enemies. It was organized by Joseph Smith at Kirtland, Ohio, 30 March 1836, by a "covenant" to avenge any further expulsion of the Missouri Mormons by mobs; on the basis of a "revelation" of 6 Aug. 1833, justifying any Mormon in "rewarding thine enemy according to his works." The first name chosen was Daughters of Zion, from Micah iv. 13; this not seeming graphic, it was changed to Destroying Angels, or Flying Angels, the former used for many years; then the Big Fan (Jer. xv. 7 or Luke iii. 17); then Brothers of Gideon; finally Sons of Dan, turned by outsiders into Danites, from Gen. xlix. 17. A constitution was adopted, giving the executive power to the president of the Church and his counselors, and the legislative power to the same, with the generals and colonels of the society; this legislature to have power to "administer punishments to the guilty in accordance with the offense." The oath taken by the members was to obey the Prophet and First Presidency "in all things, the same as the supreme God"; to "stand by my brethren," and "uphold the presidency, right or wrong"; and invoking terrible punishments for revealing the secrets of the society. The Mormons have usually denied that the society existed, or if so that it was countenanced by the Church; and Smith's Nauvoo council denied its existence there. Brigham Young, however, boasted of its existence in Salt Lake City. Its actions, from the nature of the case, can only be inferred. It is usually credited with all the deeds of blood charged against the Mormons, including the Mountain Meadows massacre (q.v.). The name was attached by the Douglas Democrats to the administration (Buchanan) Democrats in the Lincoln-Douglas senatorial Illinois campaign of 1858, as an insinuation that they were Buchanan's tools in upholding the Utah rebellion.

Dannat, William T., American figure painter: b. New York 1853. He was a pupil of the Royal Academy, Munich, and of Munkacsy in Paris, and took the medal of the third class in Paris 1883. Among his works are: 'Bavarian Peasant' (1878); 'Aragonese Contrabandist' (1883); 'Castanet Dance; A Quartette' (1884).

Dannecker, Johann Heinrich, yō'hän hīn'rĭH dän'nĕk-ĕr, German sculptor: b. Waldenbach, near Stuttgart, 15 Oct. 1758; d. Stuttgart 8 Dec. 1841. At the Karlschule he devoted himself so successfully to sculpture that a statue of Milo of Crotona, executed in his 17th year, excited great admiration. On leaving he was appointed court sculptor, and three years after visited Paris and Rome. In the latter city he executed a Ceres and Bacchus, which procured him admission into the academies of Bologna and Milan. In 1790 he returned to Würtemberg, and became professor of the fine arts at Stuttgart. From this period he continued his professional labors with most brilliant success, and was patronized by the most distinguished personages in Germany. His acknowledged masterpiece is a statue of Christ, which occupied him during eight years, and the prototype of which is said to have been suggested to him in a dream. His 'Ariadne seated on the Panther' is a splendid work, and in the opinion of some critics is superior as a work of art to his 'Christ.' As a sculptor he occupies an intermediate place between Canova and Thorwaldsen, having blended in the happiest manner the spirited conception of the former with great anatomical skill, careful execution, and nice appreciation of nature. See Radcliffe, 'Schools and Masters of Sculpture' (1894).

Dannemora, dăn-ne-mō'ra, N. Y., a village in Clinton County; on the Chateaugay Railroad; 12 miles west of Plattsburg. Here is located one of the State prisons called Clinton State

Prison. The iron ore found in the vicinity is of an excellent quality. Pop. 4,213.

Dannemora, dän-nē-moo'rä, Sweden, a straggling village, on a lake of the same name, 24 miles northeast of Upsala, in the district of Upsala. It is celebrated for its iron mines, the second richest in Sweden, which have been worked uninterruptedly for upward of three centuries, and produce the finest iron in the world. The mine has been sunk more than 100 fathoms, and as part of the workings runs under the lake, great trouble is sometimes experienced in keeping out the water. The total quantity of ore raised is about 70,000 tons per annum. It consists of 86 to 90 per cent magnetic oxide of iron, 7 to 12 per cent silica, and traces of manganese, lime, magnesia, and alumina, the earthy matters being in the proportion to form a fusible slag without further addition. It is almost free from sulphur and phosphorus, and as the charcoal fuel employed in smelting is also free from these impurities, the Dannemora iron enjoys the highest reputation, and is in great demand for conversion into steel.

Dannreuther, dän'roi-ter, **Edward,** English pianist and conductor: b. Strasburg, Germany, 4 Nov. 1844; d. 12 Feb. 1905. He was educated at Cincinnati, Ohio, studied music at Leipsic under Moscheles, and in 1863 went to London and lectured on Wagner, Bach, Beethoven, etc. He conducted the first Wagner concerts in London 1873–4, and has published: 'Musical Ornamentation'; 'Richard Wagner: His Tendencies and Theories'; 'The Music of the Future'; 'On Conducting.'

D'Annunzio, Gabriele. See ANNUNZIO GABRIELE D'.

Dantan, Antoine Laurent, än-twän lō-rŏn dän-tän, called Dantan the Elder, French sculptor: b. Saint Cloud 9 Dec. 1798; d. there 31 May 1878. He was a pupil of Bosio, taking the second grand prize of Rome for sculpture in 1823 and the first prize in 1828, the latter for a 'Death of Hercules.' Yielding himself, at first, entirely to the influence of the antique in his art, he afterward found a more original style. He obtained the decoration of the Legion of Honor in 1843, and secured a medal of the third class at the Exposition in 1855. Among his works are: 'Young Bather and Dog' (1835), which took a medal of the first class 1833; 'Drunkenness of Silenus' (1836); a bronze 'Young Girl and Tambourine' (1838); 'Statue of Louis Joseph de Bourbon'; 'Statue of the Maréchal de Villars'; 'Bust of the Dauphin of France.' A monumental 'Juvenal des Ursins' was ordered for the Hotel de Ville in Paris 1838; and 'The Angel Raphael' for the Madeleine 1839. 'Duquesne' was made for Dieppe in 1844, and a 'Saint Christopher' for the church of La Villette in 1846. He was the author of many statues decorating the monuments of Paris, the churches of Saint Gervais, Sainte Clotilde, Saint Laurent, the Tower of Saint Jacques, the belfry of Saint Germain l'Auxerrois, and the new Louvre, besides busts for the museum at Versailles, the senate, and the Comédie Française.

Dantan, Jean Pierre, zhŏn-pē-ār (called "DANTAN THE YOUNGER"), French sculptor: b. Paris 26 Dec. 1800; d. Baden 6 Sept. 1869. He was a brother of A. L. Dantan (q.v.). He achieved great reputation for his diverting caricatures of prominent men, such as: Paganini, Rossini, Victor Hugo, Frederic Soulie, Balzac, Alexander Dumas, Frederic Le Maitre, and of himself which were exhibited at the Dantan Museum in Paris, but his popularity as a caricaturist injured to some extent his fame as a serious artist. Among his works are statues of Boieldieu, at Rouen; Philibert Delorme, at the Louvre; and busts of Adelaide Kemble, Rose Cheri, Canrobert, Jean Bart, Pleyel, Rossini, Thalberg, Duke of Wellington, and Lord Brougham.

Dantan, Joseph Edouard, zhō-zĕf ā-doo-ăr, French painter: b. Paris 26 Aug. 1848; d. Villerville 1897. He was a son of J. P. Dantan (q.v.). He was a pupil of Pils, but soon abandoned historical and religious for genre painting. Among his works are: 'The Holy Trinity'; 'An Episode of the Destruction of Pompeii' (1869); 'A Monk Carving a Christ in Wood'; 'Hercules at the feet of Omphale' (1874); 'The Nymph Salmacis and the Young Hermaphrodite' (1876); 'Vocation of the Apostles Peter and Andrew' (1877); 'The Corner of a Studio' 1880); in the Luxembourg; 'Breakfast of the Model' (1881); 'Interior at Villerville' (1883); 'The Studios' (1884); 'The Widower' (1885); 'Modeling from Nature' (1887).

Dante, (originally DURANTE) **Alighieri,** dän'tā a"lē-gē-ā'rē, Italian poet: b. Florence May 1265; d. Ravenna, Italy, 14 Sept. 1321. He was of a family belonging to the lower nobility, and of mixed descent, the Aldighieri, or Alighieri, being originally Teutonic. He lost his father in early life, but his mother watched carefully over his education, which was confided to the eminent philosopher and statesman, Brunetto Latini. He is said to have studied at Bologna, Padua, Naples, and even Paris and Oxford, but we have no means of confirming the statement in any measure. What is tolerably certain is that he had mastered the learning of that age. He was a musician and painter, a theologian and linguist of no mean order. Many of his biographers state that it was in 1274, when nine years of age, that he saw for the first time, and ever afterward devotedly loved, Beatrice Portinari. Others affirm that that event took place shortly before her death, in 1290, three years after she had married a noble Florentine, Simone Bardi. His love for her awakened in him a new life; all the powers of his soul were to be henceforth devoted to immortalize her, and we can watch the struggles of his spirit in that record he has left us of his early years, the 'Vita Nuova.' About the period when Dante reached the age of manhood the Guelfs (the Papal or Church party) were predominant in Florence, whence they had, aided by the Pope and Charles, king of Naples, driven the Ghibellines (the imperial or state party). At Arezzo, on the other hand, the Ghibellines had succeeded in exiling the Guelfs, who implored the assistance of their Florentine friends. A war was declared between the two cities, which was terminated in June 1829 by the battle of Campoldino, in which the Ghibellines were defeated. Dante was there fighting bravely, and contributed not a little to the victory of the Guelfs. In 1291 he married Gemma dei Donati, a daughter of one of the most powerful families of the state, and which belonged to the Guelf

faction. By this lady he had seven children, the youngest, Beatrice, being born about 1301. In 1293 a revolution broke out in the city, headed by Giano della Bella, whereby the priors of the trades took the power into their own hands, and made nobility a disqualification for holding office. The following year, however, Giano della Bella was deprived of power, and the nobles disagreeing among themselves, and splitting into two factions, the Bianchi and the Neri (the White and the Black), the streets of Florence were continually the scenes of sanguinary fights. In order to check the excesses of the greater nobles, a number of the lesser nobility, Dante among them, threw in their lot with the citizens' party. In order to render himself eligible for office Dante had his name inscribed in the books of the physicians and apothecaries, and in June 1300 was nominated a prior of the trades, one of the highest offices in the state. Although leagued by marriage to the Guelf side, Dante was no rampant partisan, and on one occasion, when roused by some fresh act of atrocity, he proposed and carried a law to the effect that the heads of the Bianchi and Neri parties should be temporarily banished. It appears that the Bianchi and Neri were originally Guelfs, but the latter were the extreme Papal party, and the former leaned toward a reconciliation with the Ghibellines. Dante's sympathies were with the Bianchi, and on the too hasty return of one of the exiles, Guido Cavalcanti, a friend of the poet's, and one of the Bianchi, Dante was charged with undue partiality in permitting him to remain in the city. The Neri wrote to the Pope that the Bianchi were making common cause with the Ghibellines, and Boniface VIII. sent Charles of Naples to occupy the town, and keep down the turbulent spirit of the Florentines. The Neri were allowed, however, to commit the greatest excesses unchecked by Charles: many of their rivals were slain in the open street, and their houses burned to the ground; among others that of Dante, who had been sent to Rome by his party to try to influence the Pope in their behalf. Taking advantage of his absence, his enemies obtained a decree of banishment against him, together with the heads of his party, and he was further condemned to pay a fine of 8,000 florins, or have his property confiscated (January 1302). Two months later a second sentence was launched against him and several of his friends: they were condemned to be burned alive for malversation, peculation, and usury. The fine he refused to pay, as it would imply a confession of guilt.

From this time forth the life of the poet becomes semi-mythical. We find some traces of him first at Arezzo, then at Sienna, then at Verona. He himself says, "Through almost all parts where this language (the Italian) is spoken, a wanderer, well nigh a beggar, I have traveled, showing against my will the wounds of fortune." His sympathies now lay entirely with the Ghibelline party. The expedition of the emperor, Henry VII., into Italy (1310) roused the hopes of Dante to the highest pitch. He wrote the emperor that famous letter advising him first of all to crush the hydra, Florence, as being the cause of all the misfortunes of Italy. Henry, however, spent his time in foolish inactivity till his death in 1313. Shortly after this event Dante is said to have visited Paris; but according to Balbo he spent the year 1313–14 in Pisa and Lucca, and then took refuge with Can Grande della Scala at Verona, where he remained till 1318. In 1316 Florence sent forth a decree permitting the exiles to return on conditions of fine and penance, which Dante indignantly refused. In 1320 we find him at Ravenna staying with his friend Guido Novello da Polenta. In the following year, on his return from an embassy to Venice, his wanderings and sufferings were ended by death. He was buried in the Church of the Minorites, under a monument built by his friend Guido Novello, on which was an epitaph written by Dante himself. Such, imperfectly sketched, was the career of the great poet; by it he gained a sense of the nothingness of earthly honors and prosperity possible only to the rich, and a knowledge of man possible only to the poor. In his youth living amid the excitement of the tented field and penning sonnets to his adored Beatrice; in his old age compelled "to climb the stranger's toilsome stairs, and eat the bitter bread of others." Out of his misfortunes the world found her rich account; the apocalypse of the Middle Ages, the 'Divina Commedia,' was begun and finished in his year of exile. Of this grand poem we can give only a very brief analysis. It is divided into three parts: Hell, Purgatory, and Heaven. Each part is subdivided into 33 cantos, in allusion to the years of our Saviour's life, the extra canto in the first part being introductory. Dante dreams that he had "reached the halfway point in his path of life, at the entrance of an obscure forest." He would advance, but three horrible beasts bar the way; then the shade of Virgil appears and offers itself as his guide. Dante accepts, and then takes place that wondrous journey in the "world of souls." Virgil tells him he can only accompany him through hell and purgatory; but that Beatrice shall conduct him through those happy spheres, the portals of which a pagan may not enter. Now begin the peregrinations of the Florentine through the regions of the damned, over the entrance of which is written the awful words—"All hope abandon ye who enter here." This is the most impressive and best-known part of the poem: the singular diversity of the chastisements; the rapidity with which Dante passes in review the great criminals of history; the intensity with which he paints, at a single dash, so to speak, their distorted features; the grace of certain episodes (the adventure of Francesca da Rimini, the death of Ugolino, and that of Manfred), attest a vigor of imagination never surpassed, if ever equaled. From Hell (which the poet places in the centre of the earth) he ascends to Purgatory, a solitary mountain rising from the ocean on the side of the globe opposite to us. This mountain is divided into terraces, and its top is the terrestrial paradise, the first abode of man. In Purgatory there are still scenes of pain and suffering; but these punishments are only temporary. The poet hesitates when he comes to a path filled with a sheet of flame; but Virgil speaks: "Between Beatrice and thee there is but that wall." Dante at once plunges into the heart of the flames. The two poets have now reached the earthly paradise, and behold Beatrice surrounded by a scene of surpassing magnificence; noble forests, whose trees are gently moved by celestial zephyrs; the melodious songs of birds to which the murmuring of the sacred woods and streams give harmonious re-

ply; meadows of the freshest green, and groves of deepest shade. From this enchanting region Dante ascends, faster than tongue or pen can tell, into the celestial paradise. This realm consists of 10 heavens or circles. Dante roams at first over the seven planets, the Moon, Mercury, Venus, the Sun, Mars, Jupiter, and Saturn; then he enters the eighth sphere, and at last into the empyrean. Each of these globes has its inhabitants, who are souls or spirits. Arrived at the eighth sphere, he looks down upon our globe; but the earth appears so abject that he smiles with pity upon it. Beatrice calls his attention to a nobler scene. "See the glorious company which surrounds the triumphant Redeemer." The eyes of the poet cannot sustain the splendor of the view. In the ninth sphere Dante feels himself in the presence of the Divine essence, hid from his sight by three hierarchies of angels. He sees the souls of the blessed on thrones in a vast amphitheatre, whose steps and circles widen into infinity. Beatrice takes her place upon her throne of glory; from that sublime height she smiles benignantly down upon the poet; then turns toward him who is the source of life and light. Thus ends the Divine trilogy, the noblest effort of the Middle Ages.

The name "Commedia" is derived from Dante's idea concerning the forms of eloquence, which were in his opinion tragic, comic, and elegiac, as he relates in his work 'De vulgari Eloquio,' which was first written in Latin. What he called tragedy was a piece commencing with happy and peaceful scenes, and ending with events of a painful and terrible character, and what he called comedy was a piece which, beginning unpleasantly, terminated happily. The qualifying word divina was, however, added by others. We may mention the opinion maintained in 1753 by Bottari, that Dante made use of the 'Vision of Alberico' a monk who lived in the 12th century, in a monastery on Monte Cassino, in Naples. There have been many such visions from the earliest ages of Christianity; as, for instance, the 'Vision of an English Monk,' which Matthew Paris mentions in his 'History of England' (in the year 1196), and which resembled Dante's poem much more than the 'Vision of Alberico' published by Cancellieri in 1814 at Rome, with observations ('Osservazioni intorno alla Questione sopra la Originalità della Divina Commedia di Dante'). It is possible that Dante here and there may have borrowed a thought or image from those visions; but this is no fault: the recollections of great men are sparks which serve to kindle mighty flames.

There is no poet who bears so distinctly the impress of his age, and yet rises so high above it, as Dante. The Italians justly regard him as the creator of their poetical language, and the father of their poetry, which, regulated and controlled by his genius, at once assumed a purer and far nobler form than it had previously worn. The terzina first reached its perfection in the time of Dante, on which account he has been erroneously regarded as the inventor of it.

Florence soon recognized that she had lost her noblest son. In 1350 a sum of 10 golden florins was ordered to be paid by the hands of Giovanni Boccaccio to Dante's daughter, Beatrice, a nun in the convent of Santa Chiara at Ravenna. In 1373 an annual sum was granted for public lectures, to explain the 'Divine Comedy' in the churches, and Boccaccio was one of the first lecturers. A monument was voted for if Ravenna would give up the now sacred remains, which that city refused, and has repeatedly refused to do. In May 1865 all Italy assembled at Florence to render homage to the seer who prophesied so confidently her unity; and the following year a colossal statue of the poet was erected on the Piazza della Croce.

The best editions of the 'Divina Commedia' are those of Lombardi (1791), frequently reprinted with valuable improvements, of Viviani (1823), of Bianchi (5th edition, Florence, 1857), of Karl Witte (Berlin 1862), etc. In 1821 Luigi Fantoni published an edition of the 'Divina Commedia,' stated to have been printed from a manuscript in the hand-writing of Boccaccio. In 1869 the 'Vernon Dante' was published in London by Lord Vernon, in three large volumes folio. It contains the text of the 'Inferno,' and, in Italian, an explanation of everything in the text regarding which any reader might have the least difficulty; together with an immense mass of information — biographical, topographical, historical, etc., relating to the life and times of Dante, and a large number of maps, plans, and illustrative plates. Dante's complete works appeared at Venice in 1757–8, published by Zatta (in 5 vols. 4to). His lyric poems, sonnets, and canzonets, of which some are beautiful, others dull and heavy, were written at different periods of his life. We have yet to mention his 'Banquet' (Il Convito) — a prose work worthy, says Bouterwek, to stand by the side of the best works of antiquity. It contains the substance of all his knowledge and experience, and thus illustrates his poetry and his life. The most popular English translation of the 'Divina Commedia' is that by Cary in blank verse (1814). Longfellow executed a faithful poetic version (1867); and that by Dean Plumptre in the original metre deserves mention. Other English translations are Boyd's (1785); Wright's (1833); Pollock's (1854); Parsons-Norton's (1891–2). The German translations are numerous, and are highly praised for faithfulness and force. The translation by Kannegieser is in the measure and rhyme of the original; that of Philalethes (King John of Saxony) has a deservedly wide reputation. The French have four or five translations, including one by Lamennais, but that graceful and feminine tongue is incapable of doing anything like justice to the manly thoughts of Dante.

In one respect Dante stands unrivaled by any man, as he, we might almost say, created the language, which he elevated at once to its highest perfection. Before him very little was written in Italian, Latin being the literary language; but no one attempted to use the *lingua volgare* for the purposes of dignified composition. The poet, indeed, thought it necessary to excuse himself for having written in Italian after having attempted to compose his poem in Latin. Thus he is to be regarded as the founder of Italian literature. One of the strangest productions of Dante is his 'De Monarchia.' He labors in this work to prove that the emperor ought to have universal authority and draws his arguments from the sacred Scriptures and from profane writers, which in this book appear very often with equal authority. The dialectics of the schoolmen are here exhibited in a most characteristic way. The 'De Monarchia' is valuable as a source of information respecting the great

struggle of the Guelfs and Ghibellines, and its influence upon the Christian world at that time. This struggle was a part of the great convulsion attending the separation of the civil power from the ecclesiastical, with which in the earliest ages it is always united. On the whole, Dante's works are important chiefly in three respects — as the productions of one of the greatest men that ever lived, as one of the keys to the history of his time, and as exhibiting the state of learning, theology, and politics in that age. To understand Dante it is necessary to be acquainted with the history and spirit of his time, particularly with the struggle of the Guelfs and Ghibellines, the state of the north of Italy, and the excitement caused by the beginning of the study of the ancients; also to have studied the Catholic theology and the history of the court of Rome, and to keep always in mind that Dante was an exile, deprived of home and happiness. The personal appearance and character of the man are thus described by Boccaccio: «Our poet was of middle height; his face was long, his nose aquiline, his jaw large, and his under lip protruding somewhat beyond the upper. His eyes rather large than small; his hair and beard thick, crisp, and black, and his countenance sad and pensive. His gait was grave and gentlemanlike, and his bearing, in public or private, wonderfully composed and polished. In meat and drink he was most temperate. Seldom did he speak unless spoken to, though he was most eloquent. In his youth he delighted in music and singing, and was intimate with all the musicians and singers of the day. He was of marvelous capacity and the most tenacious memory; inclined to solitude and fond of study when he had time for it.»

Danton, Georges Jacques, zhŏrzh zhäk däṅ-tôṅ, French revolutionist: b. Arcis-sur-Aube 26 Oct. 1759; d. Paris 5 April 1794. He played a very important part during the first years of the French Revolution, of which he was an active and zealous promoter. His external appearance was striking: his stature was colossal; his frame athletic; his features harsh, large, and disagreeable; his voice shook the dome of the chamber of the assembly; his eloquence was vehement; and his imagination was as gigantic as his person. These qualities contributed to extend his influence, and he became one of the founders of the club of the Cordeliers. After the capture of Louis XVI. at Varennes he took the lead in the meeting of the Champ-de-Mars, which demanded the dethronement of the king. He was foremost in organizing and conducting the attack on the Tuileries (10 Aug. 1792), and a few days afterward was appointed minister of justice by the legislative assembly in recognition of his services on that occasion. He also became a member of the provisional executive council, and usurped the appointment of officers in the army and departments. Money flowed from all sides into the hands of the minister, and was as profusely squandered on his tools and partisans. He endeavored by the terrors of proscription to annihilate all hope of resistance on the part of the Royalists. The invasion of Champagne by the Prussians, 2 September, spread consternation through the capital and among the members of the government. The ministers, the most distinguished deputies, and even Robespierre himself now assembled around Danton, who alone preserved his courage. He assumed the administration of the state, and prepared measures of defense; called on all Frenchmen capable of bearing arms to march against the enemy, and prevented the removal of the assembly beyond the Loire. The close of his celebrated speech has been often quoted: «Le tocsin qu'on va sonner n'est point un signal d'alarme, c'est la charge sur les ennemis de la patrie. Pour les vaincre, il nous faut de l'audace, encore de l'audace, toujours de l'audace, et la France est sauvée!» From this time forward he was hated by Robespierre, who could never pardon the superiority which Danton had shown on that occasion. He voted for the capital punishment of all returning emigrants, and undertook the defense of religious worship. The contest between the Girondists and the Mountain daily assumed a more serious aspect, and Danton appeared to fear the consequences of these dissensions. Danton wished to overthrow the despotism of Robespierre, and the crafty Robespierre endeavored to undermine him, in order to get rid of a dangerous rival. St. Just denounced him to the Committee of Safety, and Danton was arrested on the night of 31 March 1794, together with those who were called his accomplices. Being thrown into prison in the Luxembourg he maintained the appearance of serenity. When transferred into the Conciergerie his countenance became dark, and he appeared mortified at having been the dupe of Robespierre. All his discourses were a strange mixture of sorrow and pride. At his trial, on the formal question as to his name and residence being put, he answered, with perfect composure, «I am Danton, sufficiently known in the Revolution; I shall soon pass to nothingness, but my name will live in the Pantheon of history.» On 5 April the revolutionary tribunal condemned him to death as an accomplice in a conspiracy for the restoration of monarchy, and confiscated his large property. He mounted the fatal car with courage, and without assistance; his head was elevated; his look commanding and full of pride. Before ascending the scaffold he was for a moment softened. «Oh my wife, my dear wife! shall I never see you again?» he exclaimed, but checked himself hastily, and, calling out, «Danton, no weakness!» ascended the scaffold.

Dantzic, Dantsic, or Danzig, dänt'sĭh, Germany, city and port of Prussia, capital of the province of West Prussia, 253 miles northeast of Berlin; on an arm of the Vistula (now cut off by a dam from the river), about three miles above its mouth, and on the Mottlau, several arms of which traverse the town. It is one of the most important seaports under the Prussian monarchy, as well as one of its chief commercial entrepôts. It is nearly circular in form, and ranks as a fortress of the first class, being surrounded by walls and bastions, defended by a citadel and several outworks, and also provided with the means of laying a considerable part of the surrounding country under water. It is entered by four gates, has nine suburbs, and is divided into five parts — the Old, New, and Low town, the Speicher (granaries), an island, and Langgarten. The last is the more modern part of the town, and is regular and well built. The principal edifice is the Dom, or cathedral, begun in 1343, but not finished till 1503. It is 360 feet long by 142 feet broad, and its vaulted roof, 98 feet above the pavement, is supported by 26 slender brick pillars. It possesses a fine brass font and a curious astronomical clock, which has long ceased to move, but its chief attraction is a painting of the 'Last Judgment,' attributed to John Van Eyck. The other buildings and institutions deserving of notice are the town-house, the church of St. Catharine, the oldest in Dantzic, and other churches; three monasteries, convents, two synagogues, the exchange, an imposing Gothic edifice, built in 1379. Many of the modern public buildings are models of architecture. It is the seat of the provincial government, and contains the various offices connected therewith; and is also the residence of several foreign consuls. The industrial establishments include an imperial shipbuilding yard employing some 1,500 men, several other shipyards, works for artillery and firearms, iron foundries, machine shops, steel works, breweries, distilleries, works producing the liqueur called Danziger Goldwasser, or Eau de Vie de Dantzig, flour-mills, saw-mills, paper-mills, rope, wire, oil, chemical, soap, and glass works. Great efforts are being made to extend the manufacturing industries of the town, since as a shipping centre it seems to be declining owing to the competition of other ports, some of them more favorably situated. But the trade carried on is still very important, since the total value of exports and imports together amounts to about $50,000,000 per annum. Much of the trade is of products in transit. Among imports the chief are coal, iron, cured herrings, salt, tallow, and lard, petroleum, rice, coffee, and some bread stuffs. The chief exports are timber, beet-sugar, grain and seeds, oil-cake, flour, spirits, and molasses. Dantzic has a great trade in grain, especially wheat, rye, and barley, for the warehousing of which there are immense granaries on the island of Speicher, capable of containing 100,000 tons. The wheat, which is chiefly Polish, is remarkable for both the quantity and the quality of the flour which it yields. There is considerable trade at Dantzic in amber, which is manufactured into various ornamental articles. The proper port of Dantzic is Neufahrwasser, at the mouth of the Vistula (now known as the dead Vistula), and connected with it by an artificial channel. Here a free port has recently been established. By dredging and otherwise, various obstructions to navigation have been removed, and vessels of large size come up close to the town. The history of Dantzic reaches back to the times of historical obscurity. As early as 970 there was a town here. In 1271 it was taken by Mestwin, and in 1294 by the Poles. In the 14th century it fell into the hands of the Teutonic knights, under whose sway the town increased, and its commerce was extended. Left by the Teutonic knights, it again, in 1454, fell into the hands of the Poles, who granted it important privileges. After enduring many vicissitudes of fortune, on the second partition of Poland, in 1793, it came into possession of Prussia. It was besieged, bombarded, and taken by the French in 1807, and retaken by the Prussians in 1814. Since that time Prussia has done much for the town; but its commerce has never regained its former importance and extent. Pop. (1901) 140,563.

Danube (ancient, DANUBIUS; German, DONAU; Hungarian, DUNA), a famous river of Europe, originating in two small streams, the Brege and the Brigach, rising on the east slope of the Schwarzwald, a mountainous region of southwest Germany (the Black Forest), in the Grand-duchy of Baden, at an elevation of 2,850 feet above sea-level, and uniting at Donaueschingen. Its general course is from west to east, and it flows into the Black Sea by four different outlets, called respectively the Kilia, Stambool, Sulina, and the Edrillis or St. George's mouths. The Sulina mouth or channel is the deepest. The extent of the basin of the Danube is about 300,000 square miles, and its total length is about 1,875 miles. The Danube basin comprises portions of Austria-Hungary, Germany, Servia, Bosnia, Rumania, and Bulgaria. From its source it flows northeast to Ratisbon, in Bavaria, whence it takes a southeast course, by Vienna and Pressburg, to Waitzen, in Hungary. Here the course is changed to nearly due south to the point where it receives the waters of the Drave, near Esseg, in Slavonia; thence it flows southeast to Belgrade, on the north boundary of Servia, and for some distance it forms the boundary between Servia and Austria. The course continues in an easterly direction to Orsova (the Iron Gate), where it changes to southeast, then again nearly east, forming for a long distance the boundary line between Rumania and Bulgaria. At Silistria, in Bulgaria, it turns more to the north, through Rumania to Galatz, then southeast between Rumania and Bessarabia, in Russia, and finally into the Black Sea.

The great basin of the Danube has been divided into four minor basins. The first consists of a vast plateau 1,640 feet above sea-level, 150 miles in length, and 125 miles broad, surrounded by mountains, and comprising a portion of the principality of Hohenzollern, part of the kingdom of Würtemberg, and the greater part of the kingdom of Bavaria. This tract is by far the most fertile and most populous through which the Danube passes during its entire career. The principal branches within this space are the Iser and Lech.

The second basin belongs to the empire of Austria, having Vienna nearly in its centre, and comprising the archduchy of Austria, Hungary as far east as Waitzen, and Styria. It is very irregular, and is bounded by very high moun-

tains. The soil is rich in mineral products, and the climate one of the best in Europe. The principal branches in this basin are the March or Morava, and the Enns — the former from the left, and the latter from the right. The Danube here passes through a succession of the most picturesque scenery.

The third basin of the Danube comprises Hungary east of Waitzen, and the principality of Transylvania, and consists of an immense plain, almost without undulations of any kind, and only 394 feet above the sea-level. It is intersected by large rivers with marshy banks, and interspersed with stagnant pools, saline and sandy wastes. It comprises about one half of the entire basin of the Danube. The marshes cover a space of 3,053 square miles. The principal branches in this basin are the Save, the Drave, and the Morava. From Budapest to Belgrade the river passes through an immense plain covered with sand and alluvium, through which it is constantly forming new channels and filling up the former ones. Below Moldava it passes for 60 miles through a succession of rapids and shallows, interspersed with rocks and sandbanks, where it has cut a passage for itself through the cross chain of hills which connect the Carpathian Mountains with the Alps; and between Drenkova in Hungary, and Scala Kladova in Servia, the navigation is partially interrupted by three great rapids, the principal or last and lowest of which is the famous Iron Gate, where the stream rushes through a narow channel between stupendous rocks, ending with a series of whirlpools, eddies, and smaller falls. By the removal of various obstructions vessels drawing nine feet have long been able to pass at certain seasons; and by works carried out in 1890–6, and extending over some 50 miles, a permanent waterway has been secured.

The fourth basin comprises Rumania, a portion of Bessarabia, and Bulgaria. This tract is flat, inundated, and marshy along the banks of the river; dry and mountainous on the borders of the basin. The principal branches in this basin are the Aluta, Sereth, and Pruth. In the lower part of its course the Danube increases in width from 1,400 to 2,100 yards; and in one part it forms an expanse of water like a sea, and is studded with islands. Excepting between Drenkova and Kladova, the Danube may be said to be navigable for steamers from Ulm to the sea, although in some places navigation is rendered difficult by shallows and sand-banks, intersected by narrow and intricate channels. The outlets of the Danube are separated from each other by several low islands covered with reeds and trees. The greater part of the ships bound up the river enter it by the Sulina mouth. The Danube has 60 navigable tributaries, and its volume of water is nearly equal to that of all the rivers that empty themselves into the Black Sea taken together. Its rapidity is in many places above Orsova so great as to render navigation difficult, but below that point its current is less rapid. A number of steamers now ply on the river between its principal towns. The principal towns on the banks of the Danube are Ulm, in Würtemberg; Regensburg (Ratisbon) and Passau, in Bavaria; Linz and Vienna, in Austria; Pressburg, Budapest, and Peterwardein, in Hungary; Belgrade, in Servia; Widin, Nicopolis, Rustchuck, and Silistria, in Bulgaria; Brahilow and Galatz, in Rumania.

Danube Navigation Commission, an international commission, constituted in 1856, when at the Peace of Paris the navigation of the river was declared free to all nations. It was composed of delegates of all the great powers, to whom a representative of Rumania has been added since 1878. It was appointed on the express condition that it should dissolve in 1858, but such was its usefulness that it was informally continued till 1866, when the Conference of Paris formally prolonged its powers for five years. In 1871 the Conference of London continued the commission for 12 years, and in 1883 a second London conference extended its existence for 21 years. It exercises almost sovereign power on the mouths of the Danube, where it has conducted great engineering works; it has its own flag, uniform, and revenue, and has raised loans, made laws, and maintained its own small army of police. Its jurisdiction, originally limited to the river between Isaktcha and the sea, was extended at the Congress of Berlin (1878) as far as Galatz, and afterward to the Iron Gate; but in the last-named portion of the stream its authority is exercised only by delegation to the Riverain Commission of the states on the bank, or on appeal from its decisions.

Danubian Principalities. See MOLDAVIA; RUMANIA; WALLACHIA.

Danvers, Mass., town in Essex County, on the Boston & Maine Railroad, five miles northwest of Salem. It was a portion of Salem till 1756, and the Salem village parish where the witchcraft excitement broke out is included in the present Danvers. It is the seat of Peabody Institute, founded by George Peabody, a resident of the place, who in 1852 donated $200,000 for the promotion of knowledge and morality among the inhabitants. It is also the seat of Danvers Insane Asylum, built at a cost of $2,000,000, and has extensive manufactures of shoes, bricks, and carpets, and has foundries, rolling mills, tanneries, churches, high school, weekly newspapers, public library, a national bank, and good public and private schools. Pop. 8,600.

Danville, Ill., city, county-seat of Vermilion County; on the Vermilion River, and the Wabash, Chicago, and Eastern Illinois, and the Cleveland, Cincinnati, Chicago & St. Louis railroads; 125 miles south of Chicago. It has a National Soldiers' Home for disabled veterans, with over 3,500 inmates. Its chief industry is coal mining, which is carried on extensively on the bluffs of the river. It also has large railroad car and machine shops, iron foundries, planing-mills, carriage and wagon factories, organ and furniture factories as well as churches, a high school, three national banks, daily and weekly newspapers. Pop. (1900) 16,354.

Danville, Ind., county-seat of Hendricks County; situated on the Cleveland, Cincinnati, Chicago & St. Louis Railroad, about 20 miles west of Indianapolis. The manufacture of flour and lumbering are the principal industries. It is the site of the Central Normal College, a private institution. Pop. (1902) 1,802.

Danville, Ky., city, county-seat of Boyle County; on Dick's River, and the Cincinnati Southern Railroad, 42 miles south of Frankfort. It is a stock-raising centre, and the seat of several educational institutions among them

the Danville Theological Seminary, the Southern Collegiate Institute, Center College, the Caldwell Female Institute, and also the State Asylum and School for Deaf-mutes. It has churches, public schools, three national banks and weekly newspapers. Pop. (1900) 4,285.

Danville, Pa., a borough and county-seat of Montour County; on the Susquehanna River; and on the Pennsylvania, the Lackawanna, and the Philadelphia & Reading railroads; 154 miles northwest of Philadelphia. Danville is in a district abounding with iron ore, limestone, and anthracite coal; and contains the first establishment erected in the United States for the manufacture of railroad iron. It still ranks among the most extensive iron manufacturing places in the country. There are blast furnaces, iron foundries, rolling-mills, churches, two national banks, the Danville Institute, a State asylum for the insane, and daily and weekly newspapers. Pop. (1900) 8,042.

Danville, Va., city and county-seat of Pittsylvania County, on the Dan River, 140 miles southeast of Richmond, on the Danville & Western and the Southern R.R.'s. One of the oldest cities in the South; incorporated as a town in 1792. For a short time during the last days of the Southern Confederacy it was the seat of government. It is located in the famous and picturesque Piedmont section of Virginia, on a gradual slope extending from the river to an altitude of 600 feet above the sea. The river furnishes power for the cotton-mills, flour-mills, foundry, ice factory, and electric-light plant; and further development of its water power is now being made about three miles up the river, at an estimated cost of $2,000,000. Danville is the largest loose tobacco market in the world, her average annual sales being 50,000,000 pounds. The surrounding country is well adapted to grain, fruits, and tobacco. The improvements in public utilities within the past three years include larger water mains in the down-town district (16 inch), and additional fire engines (not including further improvements now under consideration) at a cost of $23,000; Main street repaved with Belgian block and Mack brick, $100,000; Craghead street, same material, $24,500, and several other less important streets paved with cobble. Further extension of the sewerage system from time to time as the growth of the city requires; new electric-light plant owned by city, with new $5,000 incandescent machine, furnishing lights for streets, business, and dwelling-houses; electric railway system rebuilt at a cost of about $320,000, first-class equipment, double track on Main street, about eight miles of track, new power-house, with double set of dynamos and engines. The Southern Bell Telephone and Telegraph Company has expended about $30,000 in improvements, and the growth of their business has been such as to require a much larger additional switchboard, which was installed recently. Danville is the seat of Roanoke Female College (Baptist), established 1859, Randolph Macon Institute for Young Ladies (Methodist), founded in 1883, and Danville Military Institute, established in 1890. The climate of the city is mild and pleasing, the streets well shaded and paved, and as a residential city it is excelled by few locations in the South. There are many new public buildings, churches, and schools; a general hospital recently enlarged and fitted with the latest improvements, seven banks — one national, five State, and one private, and two daily newspapers. Under the new constitution of the State the municipal government is administered by a mayor, elected quadrennially, and a city council, composed of two branches having different numbers, which controls appointments to most of the administrative offices. The water works, electric light and gas plants are owned and operated by the municipality. Pop. (1890) 10,303; (1900) 16,529.

Danzig. See DANTZIC.

Daphænus, an extinct genus of *Canidæ* of the Oligocene Epoch in North America. It has many primitive characters, such as small brain, long tail, short limbs, and five toes on each foot, with somewhat retractile claws. The third upper molar tooth, lost in all modern dogs, was present in *Daphænus,* giving it the complete primitive series of 44 teeth. It is considered to be a nearly direct ancestor of the modern dogs, wolves and foxes. The Carnegie Museum, Pittsburg, has a complete skeleton from Dakota.

Daphne, a famous grove near Antioch, planted by Seleucus Nicator, who erected a temple there and dedicated it to Apollo and Diana. It was a place of pagan pilgrimage noted for its license, until the spread of Christianity caused its abandonment. A graphic description of this grove is given in 'Ben Hur.' For Daphne in Egypt see TAHPANHES.

Daphne, a genus of plants belonging to the *Thymelæaceæ* or mezereon family. The genus has about 40 species, natives of Europe and Asia. The single American species is the spurge or lady laurel (*D. mezereum*), found in northern New England and New York as a fugitive from cultivation. These plants are common in temperate climates in Europe and Asia, and are valuable commercially. From the bast of some species fibres are obtained, and most of the paper used in Central Asia is made from some species of the daphne. The inner bark of *D. lagetta,* when cut into thin pieces after maceration, assumes a beautiful net-like appearance, whence it has received the name of lace-bark. The bark of the spurge-laurel (*D. mezereum*) is used in decoction as a diaphoretic in cutaneous and syphilitic affections.

Daphnepho'ria, one of the most ancient and important of the Greek festivals, observed in honor of Apollo.

Daph'nia, a microscopic crustacean of the order *Cladocera,* encased in a bivalve shell, and found in fresh-water ponds. The species pulex is the common water-flea. The head bears a single compound eye, and a pair of large branching antennæ which act as oars, giving the animal its leaping motion. Its five pairs of feet vibrate constantly to assist respiration

Daph'nin, a glucoside having the formula $C_{15}H_{16}O_9$, and occurring in the bark and blossoms of certain species of plants belonging to the genus *Daphne.* It is slightly soluble in cold water, from which it crystallizes in rectangular prisms containing two molecules of water. It is insoluble in ether, but readily dissolves in boiling alcohol. It reduces Fehling's solution slowly, and by the action of emulsin or of dilute acids it is converted into glucose and a substance called daphnetin, or di-oxy-coumarin.

Daphnis, in fabulous history, the son of Hermes (Mercury) by a nymph, educated among the nymphs, and celebrated in the Sicilian traditions as the author of bucolic poetry,

and also as a performer on the shepherd's pipe. He pastured his flocks upon Mount Ætna. The nymph Echenais, who loved the youth, threatened him with blindness if he should love another; but being intoxicated with wine by the daughter of a Sicilian prince, he forgot the warning, and thus brought upon himself the threatened punishment. Some say that he died of grief; others that the nymph transformed him into a stone. All the nymphs bewailed his death, and Hermes raised him to the heavens. On the spot where he died flowed a fountain, at which the Sicilians afterward performed yearly sacrifices.

Daphnis (dăf'nĭs) **and Chloe,** klō'ē, a pastoral romance written in Greek during the 4th or 5th century of our era and ascribed to Longus. Many English, French, and Italian pastorals were suggested by this work; but the one derived most directly from this source is Saint-Pierre's 'Paul and Virginia.' The scene of the Greek tale is laid in the island of Lesbos. A goat-herd named Lamon finds one of his goats suckling a fine baby boy, and adopts him as his own child, calling him Daphnis, and bringing him up to herd his goats. A neighbor, Dryas, discovers a baby girl nourished by a ewe in the grotto of the nymphs. She is adopted under the name of Chloe. The two young people pasture their herds in common, and are bound by a child-like affection, eventually deepening into love. Daphnis sues for the hand of Chloe. He is accepted by her foster-parents; but the marriage is deferred till the arrival of Lamon's master who proves to be the father of Daphnis. Chloe is identified as the daughter of a wealthy Lesbian. The young people are married with great pomp, but return to their pastoral life, in which they find idyllic happiness.

Dapitan, dä-pē'tän, Philippines, a Spanish province or comandancia in the northwestern part of the island of Mindanao. There are numerous rivers navigable for the native boats, and these are the chief means of communication in the province. Hemp, cotton, sugar, etc., are cultivated for domestic consumption; the forests, particularly the ebony, are valuable. There is some export trade in gums, wax, honey, cacao, etc. Pop. 20,270.

Da Ponte, Lorenzo, lō-rĕnd'zō dä pŏn'tĕ, Italian dramatist and author: b. Venice 10 March 1749; d. New York 17 Aug. 1838. He wrote the libretti for Mozart's operas 'Don Giovanni' and 'Figaro.' He came to America in 1805, and in 1828 was professor of Italian in Columbia College. He wrote many plays, sonnets, and translations, and published several works of instruction in the Italian language; also his own 'Life' (1823); 'History of the Florentine Republic and the Medici' (1833).

Darbhangah, dä-bän'gä, India, (1) a district in Bengal. In the rainy season the district becomes inundated by the overflow of the rivers Kamlá and Little Bághmati. Area 3,335 square miles; pop. 2,633,477. (2) A town of the same name is the capital of the district. It is situated on the Little Bághmati, and is the residence of the Maharaja of Darbhangah. The chief exports are oil-seeds and timber. Pop. 73,561.

D'Arblay, där-blā (Madame), **Frances Burney,** English novelist, daughter of Charles Burney: b. King's Lynn, Norfolk, 13 June 1752; d. Bath, England, 6 Jan. 1840. After she had published 'Evelina, or a Young Lady's Entrance Into the World' (1778), she became the favorite of the literary men of the day, especially Dr. Johnson. Her second novel 'Cecilia' (1782) was no less admired. In 1786 she was made second keeper of the robes to Queen Charlotte, and in 1793 was married to M. D'Arblay, a French army officer. Her other books are 'Camilla' (1795), and 'The Wanderer, or Female Difficulties' (1814). Her 'Diary and Letters,' edited by her niece (1842-6), surpass in modern estimation the rest of her writings. The record begins with 'Evelina.' The success of her first effort, the dinings, winings, and compliments that followed, are recorded with a naïve garrulousness perfectly consistent with simplicity and sincerity. She also wrote memoirs of her father (1832). 'Evelina' and 'Cecilia' were published with introductions by Annie R. Ellis (London 1881-2).

Darboy, Georges, zhŏrzh där-bwä, Archbishop of Paris: b. Fayl-Billot, department Haut of the Commune, 16 Jan. 1813; d. Paris 24 May 1871. He was admitted to the priesthood 1836, and began regular parish work; but in 1839 became professor, first of philosophy, then of dogmatic theology in the ecclesiastical seminary of Langres. Removing to Paris in 1846 he was for a while attached to the College of Henry IV. and was also editor of the journal 'Moniteur Catholique'; in 1854 he was appointed vicar-general of the archbishop of Paris and inspector of religious instruction in the schools of the diocese, that is, superintendent of the Christian doctrine work in the diocese. In 1859 he was consecrated bishop of Nancy, and in 1863 was appointed successor to Archbishop Sibour of Paris, who had been slain by an assassin. In the Vatican Council he was one of the leaders of the minority who opposed the declaration of papal infallibility on the ground that such a declaration was inopportune; but after the definition he was one of the first among its former opponents to make submission. In the siege of Paris by the German armies he won universal approval for his devoted labors in relieving the wounded and succoring the distressed; and when the Communists, known to be his mortal foes, came into control of the city, he refused to seek safety outside the walls. Arrested by the Commune and held as a hostage, he with other hostages was fusilladed to death in the yard of the prison of La Roquette, 4 April 1871. The end came while he was in the attitude of blessing his assassins and invoking forgiveness for them. It was not a mere accident or coincidence that he was the author of a 'Life of St. Thomas à Becket' (1859), that archbishop of Canterbury who was slain by assassins before the high altar of his cathedral church 700 years before; within 23 years he had seen his two nearest predecessors, archbishops of Paris, murdered, one by an individual assassin, the other (Affre) by the insurgent populace. In addition to his scholarly work, 'The Life of St. Thomas à Becket,' he wrote a new translation of 'Dionysius the Areopagite,' and also a translation of the 'Imitation of Christ.'

Darby and Joan, the names of a married couple traditionally reported to have lived in the West Riding of Yorkshire in the 18th century and been remarkable for their long and happy life together. A ballad entitled 'The Happy

Old Couple,' by Henry Woodfall, commemorates their excellencies. Humdrum, uneventful married life is sometimes referred to as a "Darby and Joan" existence.

Darbyites, a name often applied to the Plymouth Brethren (q.v.) from their principal founder, John Nelson Darby (1800–82), of whose collected writings 32 volumes have appeared (1867–83). See his 'Personal Recollections' (1881).

Dar'byshire, Alfred, English architect: b. Salford, Lancashire, 1839. He began the practice of his profession in 1862 at Manchester and has designed many buildings of importance there and elsewhere. He has published 'Experiences of an Architect, Professional, Artistic, and Theatrical'; 'A Book of Old Manchester and Salford.' He was art critic of the Manchester *Guardian,* 1868–74, and has acted in a similar capacity for the Manchester *Courier* from 1875 to the present.

Darcet, Felix, fālēks där-sā, French chemist: b. Paris about 1807; d. there 18 Dec. 1846. He was a son of Jean Pierre Darcet (q.v.); studied medicine and became a physician, but paid some attention to chemistry, and published researches on the preparation of hydriodic acid, on the action of iron at a high temperature, on benzoic acid and on camphor, on succinic acid, on arsenovinic acid, on chloretheral.

Darcet, Jean, zhŏn, French physician and chemist: b. Douazit 7 Sept. 1725; d. Paris 13 Feb. 1801. He accompanied the celebrated Montesquieu to Paris in 1742, and remained with him till his death as a literary assistant. He afterward devoted himself to chemistry, especially to technical chemistry, was appointed professor of chemistry in the College of France, and regent of the medical faculty. Darcet made many experiments with a view to the improvement of the manufacture of porcelain. He also tried the effect of fire on the various kinds of earths, and demonstrated the volatility of the diamond. In 1776 he published a memoir on the geology of the Pyrenees. He succeeded Macquer as a member of the Academy of Sciences and director of the manufactory of Sèvres. He was afterward appointed inspector-general of the assay of coin and inspector of the Gobelin manufactory. He made several important chemical discoveries, and contributed much to the present improved state of the science. A fusible alloy of lead, bismuth, and tin is named after him.

Darcet, Jean Pierre Joseph, zhŏn pē-ār zhō-zef, French chemist: b. Paris 31 Aug. 1777; d. there 2 Aug. 1844. He was a son of Jean Darcet (q.v.). He began his chemical studies early with his father and with Vauquelin. In his 24th year he was made assayer of the mint, and from that time devoted his time chiefly to chemistry in its application to the arts. Being employed by the government in the manufacture of gunpowder, he rendered its preparation much more easy by new processes. He greatly assisted in extending the manufacture of soda artificially, succeeded in producing alum equal in quality to that of Italy, brought the art of stereotyping to greater perfection, facilitated the preparation of sulphuric acid, investigated the best alloys for cannon, for cymbals and tam-tams, and for statues, etc. Among his other discoveries were the extraction of soda from chestnuts, the preparation of sugar from the same material, and the extraction of jelly from bones by means of an acid. He also made another discovery of great importance, whereby he obtained the prize of 3,000 francs which Ravrio had provided for the discovery of the means of protection against the fine dust of quicksilver, which had been so unhealthy to the gilders. Darcet's discovery completely attained the object.

D'Arcy, Ella, English novelist: b. London. She was educated in France and Germany and has published: 'Monochromes' (1895); 'The Bishop's Dilemma' (1898); 'Modern Instances' (1898).

Dardanelles, där-da-nĕlz' (ancient HELLESPONT), a narrow channel, in the Turkish dominions, which connects the Sea of Marmora with the Ægean Sea, and separates Europe from Asia. It is about 40 miles in length, varying in breadth from one to four miles. There is always a rapid current in the channel, the volume and velocity of which is much increased by the prevailing winds, which blow in the same direction with the stream for at least 10 months in the year. The modern name of this strait is derived from the castles, called the Dardanelles, built on its banks, at its southwest entrance; its ancient name, Hellespont, from Helle, daughter of Athamas, king of Thebes, who was fabled to have been drowned in it. Xerxes on his great expedition against Greece, in 480 B.C., crossed this strait by means of two bridges of boats, constructed in the neighborhood of Sestos and Abydos. It is also renowned as the scene of the death of Leander, who, it is said, used to swim across from Abydos on the Asiatic side, at the narrowest part of the strait (but yet about a mile in width), to visit Hero of Sestos on the European side. This feat of swimming the channel was also performed by Lord Byron, who achieved it in 1 hour and 10 minutes. To protect Constantinople, coast batteries have been built since 1867, on both the Asiatic and the European side. These batteries have latterly been supplied, in part at least, with ordnance of recent type, such as the guns made by Krupp. In 1770 the Turkish defenses were almost in ruins. Warned by the condition of the batteries when a Russian squadron appeared before the castles, the Turkish government ordered the defenses repaired; but they were again allowed to become almost useless until 1807. In that year a British squadron passed the Dardenelles and appeared before Constantinople, which until then had never seen an enemy's fleet. In 1854, during the Crimean war, the castles and other defenses of Constantinople were again put in repair. It had long been recognized that the Turks had a right to prevent any foreign ship of war from passing the Dardanelles, and in 1841 a treaty was signed between the five great European powers and the Porte, in which it was laid down that this was not to be permitted. The treaty was confirmed in 1856, the Sultan, however, retaining the right to permit certain vessels belonging to foreign governments to pass. By the Berlin treaty of 1878 the duty was again imposed upon the Sultan to prevent the passage of any foreign ship of war.

Dardanus, där'da-nŭs, in mythology, the progenitor of the Trojans, and so of the

Romans, and the son of Zeus and Electra, the daughter of Atlas. He emigrated from Samothrace (according to some accounts, from Arcadia, or Crete), and settled in Phrygia in the country which was afterward called Troas. Here he built a city, which, from him, was called Dardanum, or Dardanus, and introduced the worship of Athena (Minerva).

Dardistan, där-dĭs-tän, the name given to a region of central Asia, bordering on Baltistan, the northwest portion of Cashmere. This country, which consists of lofty mountains, is little known, and its limits are variously given; but its interest depends mainly on the fact that its inhabitants, the Dards, are an Aryan people, speaking a Sanskritic tongue mixed with Persian words. They have been called "Stray Aryans in Tibet," and are Moslems converted from Buddhism at a comparatively recent period. The rajah of Cashmere is constantly endeavoring to subject them completel to his authority. The chief districts are Hasora, Gilghit, and Tassin; some authorities also include Chitral in Dardistan.

Dare, Virginia, first child of English parents in the New World: b. Roanoke August 1587, and named after the district of Virginia. She was the granddaughter of John White, who was governor of the colony sent by Sir Walter Raleigh to found an agricultural state, which sailed from Plymouth, 26 April 1587, and reached the shores of Virginia in July of the same year. White's daughter was married to Mr. Dare, who was one of the assistants of the governor, and Virginia was born about a month after the arrival of the expedition.

Darfur, där'foor, or **Darfoor** (Country of the Fur, a tribe of negroes), a region of central Africa, occupying a large portion of the area between Abyssinia and Bornou, and forming part of the Egyptian Sudan. It may be considered as lying between lat. 10° and 16° N., and lon. 22° and 28° E.; area, 150,000 square miles. On the east it has Kordofan; on the west, Wadai; on the north, the desert; while the regions to the south are occupied by barbarous nations. The most important physical feature is the Djebel Marrah, a chain of mountains near the centre of the country, of a crescent form, lying north and south and reaching the height of 6,000 feet. Some of the peaks are extinct volcanoes. There are other subordinate chains and elevated masses. There seem to be no permanent streams, the water-courses being filled only temporarily. The country belongs mainly to the Nile basin, partly to that of Lake Chad. Large portions of it are barren or are covered with verdure only in the rainy season. The inhabitants are of various races, some of them of the negro type, others having little of the negro character, and a considerable number being Arabs. The Fur or For, who give name to the country, inhabit the mountainous central parts, and are of a brownish-black color with negro features. Mohammedanism is the religion of the country, and to it is due what little civilization the people possess; but the natives are still semi-barbarous. Their occupation is chiefly agriculture. A few of the mechanical arts are carried on, and in particular the people manufacture a considerable variety of articles, including cotton goods, pottery, leather, lance-heads, etc. Their houses are rudely constructed of clay and reeds, and with scanty accommodation. Among the exports the most important are camels, ivory, the horns, teeth, and hide of the rhinoceros and hippopotamus, ostrich feathers, gum, and copper. The imports comprise beads, glass, arms, light cloths of different kinds, silks, shoes, and other manufactured articles. Darfur was an independent kingdom till annexed by Egypt in 1874. During the ascendency of the Mahdi and his successor it was independent; but it is now recognized as within the "sphere of influence" of Great Britain. The capital is El Fâsher. Pop. 4,000,000.

D'Argenson, Marc Pierre, märc pē-ār därzhäñ-sôñ, **Comte,** French statesman: b. 1696; d. Paris 1764. He was the younger son of the Marquis d'Argenson (1652–1721), who created the secret police and established the *lettres de cachet.* He became war minister in 1743, at a time when the very political existence of France was imperiled, and by his vigor and lucky choice of generals changed the fortunes of the war in the course of a single year. After the peace of Aix-la-Chapelle (1748), he devoted himself to the improvement of the military system, and in 1751 established the Ecole Militaire. He was an illustrious patron of literature. Diderot and D'Alembert dedicated to him their great 'Encyclopédie'; and to Voltaire, whose fellow-student he had been, he furnished materials for his 'Siècle de Louis XIV.' In 1757 he was banished to his estate by the machinations of Madame Pompadour; but on her death he returned to Paris.

Dargomyzhsky, där-gō-mĭzh'skē, or **Dargomijsky, Alexander Sergievitch,** Russian composer: b. village of government of Toula, 2 Feb. 1813; d. St. Petersburg 29 Jan. 1869. He composed the music for the libretto of 'Esmeralda,' which Victor Hugo wrote for Louise Bertin, many piano pieces, 100 romances, airs, and duets for the voice, symphonic and choral fantasies and a "cantata-ballet," called 'The Festival of Bacchus,' besides the opera of 'La Roussalka,' his happiest effort, given at St. Petersburg in 1856. After this he tried to form a new school, dying before the completion of his opera, 'The Guest of Peter,' which was finished by friends and given in 1872 without much success.

Daric, dăr'ĭk, properly **Daricus** (Gr. *δαρεικός*), an ancient Persian coin of pure gold, specimens of which are still preserved in several European collections, bearing on one side the image of a kneeling archer, on the other that of a royal palla. It was known to the Greeks, Romans, and Jews; the latter used it after the Babylonian captivity, under the reign of the Persians, and called it *adarkon* or *darkemon* (mentioned in the first book of Chronicles, by Esdras and Nehemiah). Its value was equal to 20 silver drachmæ, or 16 shillings 3 pence; 3,000 being equal (according to Xenophon) to 10 talents. Its name is variously derived from that of King Darius Hystaspes, who regulated the Persian currency, and from several Persian words meaning king, palace, and bow. The so-called silver darics were not designated by this name in antiquity.

Darien, dā'rĭ-ĕn, Ga., city, county-seat of McIntosh County; on the Altamaha River, and the Darien & Western Railroad; about 65 miles southwest of Savannah, and about 10 miles

from the ocean. Lumber, rice, and vegetables are sent from here to the markets along the coast. Pop. 2,000.

Darien, dā'rĭ-ĕn, Sp. dä-rē-ān', **The Colony of,** established by the Spaniards on the Gulf of Urabá (See GULF OF DARIEN), in the first decade of the 16th century, was the centre from which exploring expeditions were sent out until Panamá was founded in 1519. A notary of Triana, named Bastidas, sailed along the Caribbean coast of the isthmus in 1501, Balboa being one of his companions. At the end of 1502 and beginning of 1503 Columbus carefully examined the region immediately west of this gulf. In 1508 the king granted to Nicuesa the territory from the Gulf of Darien to Cape Gracias á Dios; to Ojeda, the territory from the Gulf of Darien to Cape de la Vela. The dividing line was more precisely fixed by the grantees, who agreed that it should be the Atrato River. (See DARIEN, GULF OF.) In the event the only permanent settlements were made near this river and the gulf into which it flows. Ojeda first landed at Cartagena (1509), where his expedition endured great hardships. Removing thence to the eastern side of the Gulf of Urabá, he built the fort called San Sebastian, which he entrusted to Francisco Pizarro, and then returned to the West Indies. Pizarro, Balboa, and all who remained alive set sail for Cartagena once more. There they were met by Enciso, with re-enforcements from San Domingo, and after some hesitation, crossed the gulf to the western shore, where the colony of Santa Maria de la Antigua del Darien was established in 1510. Balboa gained ascendency by recommending the selection of this place (which he had visited with Bastidas), and became the leading spirit in the undertakings which followed — the expedition to Dabaiba, the crossing of the isthmus, etc. (see BALBOA).

Nicuesa's expedition, though it started under brighter auspices, resulted in a lamentable failure. Its courtly leader, after losing nearly all his followers near Cape Nombre de Dios, was forced to put to sea in a boat that could not outlive a single storm — practically condemned to death by the authorities at Darien, whom he had offended. In 1514 Pedrarias Davila superseded Balboa as governor. Five years later Panamá was founded; the capital was established on the Pacific coast; exploration northward and southward began along the shores of the newly discovered ocean; the isthmian traffic sought and found an easier route, better harbors, and a less deadly climate at a distance from the Gulf of Urabá. Darien was abandoned. See CENTRAL AMERICA; SOUTH AMERICA.

Darien, Gulf of, also called **The Gulf of Urabá,** an extension of the Caribbean Sea forming a wedge-shaped indentation in the northern coast of Colombia; of great width between Colón and Cartagena, but narrowing toward the south until it becomes an estuary of the Atrato River. A distinction to be commended on the ground of convenience is that which would restrict the name Urabá to the southern portion, which is about 7 miles wide by 30 long. Some of the earliest Spanish settlements, at the beginning of the 16th century, were located on the Gulf of Urabá (see DARIEN, THE COLONY OF); the region has not prospered, however, owing to the lack of good harbors; to the extremely unhealthful, hot, and damp climate of the coast at this point; and the diversion of isthmian traffic to Colón and Parana.

Darien, Isthmus of, the neck of land uniting South and Central America; more specifically, the lower portion which is narrowed between the gulfs of Urabá and San Miguel, while its prolongation on the northwest, between the Caribbean Sea and the Gulf of Panamá, is called the Isthmus of Panamá. It is traversed by the Cordillera de Baudó. Its principal rivers are the Tuira (also called Darien), which rises in the heights of Aspaves, receives the waters of a number of tributaries, and flows into the Gulf of San Miguel, and the Atrato, which comes out of the department of Cauca and empties into the Gulf of Urabá. In regard to the climate on the coast, see DARIEN, GULF OF. A Colombian official publication says: "The interior of the Isthmus of Darien is very sickly, and only the negroes and Indian half-breeds can stand its excessively rainy climate, hot and damp, and its atmosphere, which the marshes make malarious. Though about the Darien cordillera the temperature is milder, it cannot be said that the region is salubrious; and it will never be until the great woods and groves shall have disappeared." The woods in question, especially in South Darien, are of excellent quality and colossal growth, constituting a source of wealth. Gold is obtained from the rivers Balsas and Marca, and the mines of Cana or Espiritu Santo, near the Tuira River, were famous in the old days. For other natural resources, etc., see PANAMÁ, DEPARTMENT OF; for historical sketch, see DARIEN, THE COLONY.

Darien River, the name sometimes given to two streams in the Republic of Colombia: (1) A river emptying into the Gulf of Urabá, on the banks of which Balboa and others founded in 1510 the town of Antigua del Darien (see DARIEN, THE COLONY); (2) the Tuira River (see DARIEN, ISTHMUS OF).

Darien Scheme, a celebrated financial project, conceived and set afloat by William Paterson, a Scotchman, toward the close of the 17th century. It is said that he was originally a buccaneer, that he was a clergyman, and that he was a merchant; the probabilities are on the side of the last assertion, as he possessed a wide knowledge of commerce and finance. He was undoubtedly a man of an original mind, and of a bold and enterprising disposition. He was the first projector of the Bank of England, and being defrauded of his just recompense by those who adopted his plans, he resolved to confine his future schemes to the benefit of his native country. On his original and ostensible design of establishing an East India trade in Scotland, he ingrafted the secret and magnificent plan of forming an emporium on each side of the Isthmus of Darien or Panama, for the trade of the opposite continents. According to his idea, the manufactures of Europe were to be sent to the Gulf of Darien, and thence conveyed by land across the ridge of mountains that intersect the isthmus, where they were to be exchanged for the produce of South America and of Asia; and thus, to use his own emphatic language, he would wrest the keys of the world from Spain. In order to attract encouragement and support, he proposed to render his settlement a free port,

and to banish all distinction of party, religion, or nation. But Scotland was at this time very poor; and Paterson went to London to procure subscriptions, which soon ran up to the amount of $1,500,000. But alarm, first excited by the East India Company and the West India merchants, soon spread over the whole English nation. Even the Parliament addressed King William, in an address remarkable for narrow and illiberal views; and the king, who could ill afford to quarrel with both the English houses of Parliament, nor compromise himself at this juncture with Spain, replied to the address in terms which were interpreted as disfavorable to the scheme, and the English subscriptions were withdrawn. But Paterson himself was not to be easily intimidated; and Scotland, indignant at the opposition which the plan had met with in England, avowedly because it would be beneficial to the Scotch, immediately subscribed $2,000,000, although at that time there was not above $4,000,000 of cash in the kingdom. Only a little more than the half of the subscriptions, however, was ever paid up. Such was the national enthusiasm, that young women threw their little fortunes into the stock, and widows sold their jointures to get the command of money for the same purpose. Besides this sum, $1,500,000 was subscribed at Hamburg, which, however, was withdrawn, in consequence of the threatening memorial presented by the English resident to the senate of that city. The Scotch, nevertheless, persisted in their scheme: five large vessels, laden with merchandise, military stores, and provisions, with a colony of 1,200 persons, sailed for the Isthmus of Darien, which they reached after a voyage of about four months.

The settlement was very judiciously formed at Acta, a place at an equal distance between Porto Bello and Cartagena. Here is a secure and capacious harbor, formed by a peninsula, which the colonists fortified and named Fort St. Andrew. To the settlement they gave the name of New Caledonia. Of the 1,200 persons who had embarked 300 were gentlemen, unaccustomed to labor, fatigue, or homely fare, and totally unacquainted with any of those arts which are indispensably necessary in a new colony. These consequently were of little use; and even the peasants, habituated to a cold climate, were unequal to the fatigue of clearing the ground under a burning tropical sun. In addition to these untoward circumstances, their provisions were either improper for the climate or soon exhausted. The cargoes of merchandise which they sent to the West India islands were not properly adapted for that market. The infant colony was attacked by the Spaniards, and proclamations were issued at Jamaica, Barbadoes, and in the American plantations, prohibiting all succor or access to the Scotch at Darien, on the pretense that their settlement there was an infringement of the alliance between England and Spain. For eight months the colony bore up against these accumulated misfortunes and persecutions; but at the end of this period those who survived were compelled, by disease and famine, to abandon their settlement and return to Europe.

Before this circumstance was known, two other expeditions sailed from Scotland; and the information of the abandonment of the first colony only served to arouse the Scotch nation to more determined perseverance in the plan. When the second expedition arrived, they found the huts burned and the forts demolished; famine and disease assailed them; they were attacked by the Spaniards from Panama, these they repulsed; but a larger force coming from Cartagena obliged them to capitulate, on condition that they should embark with their effects for Europe; few, however, of these or the other two colonies survived to return to Scotland.

The people of Scotland were indignant at this utter and irremediable failure. They endeavored to extort from William an acknowledgment of the national right to Darien; and failing in this, they presented an address to him to assemble the Scotch Parliament; when it did assemble, a resolution to assert the national right to their colony was only prevented by adjournment, and ultimately by proroguing the Parliament; it was, however, soon necessary to reassemble and mollify it in order to get the supplies for the army; and when it did meet again, some very popular and spirited resolutions were adopted on this subject. The Scotch nation were never afterward thoroughly reconciled to King William, and even for many years subsequent to his death, the remembrance of the loss of Darien was preserved with resentment and regret. In this scheme many families were reduced to ruin, and few had escaped without the loss of a relative or friend. Paterson, on his passage home, after the ruin of the first colony, was seized with lunacy, from which, however, he recovered. He lived many years after, pitied, respected, and neglected. In order to pave the way for a better understanding between the two countries, the lords commissioners for England agreed in 1706 to purchase the shares of the particular members of the Darien Company. A full account of the Darien expedition is to be found in the second volume of Sir John Dalrymple's 'Memoirs of Great Britain and Ireland.' The best recent authority on the subject is John Hill Burton (see his 'History of Scotland' and his 'Darien Papers'). See also Sir Walter Scott's 'Tales of a Grandfather' for a most interesting but rather one-sided narrative.

Da Rimini, Francesca, frän-chĕs'kä dä-rē'mē-nē, an Italian lady of the 13th century, the daughter of Guido da Polenta of Ravenna. She was married to Giovanni Malatesta da Rimini, a cripple, but loved his brother Paolo. Giovanni surprised the lovers at one of their meetings, and killed them both (about 1285). Their story is told in Dante's 'Inferno,' and is the subject of Leigh Hunt's poem, 'The Story of Rimini,' and of the dramas, 'Francesca da Rimini,' by D'Annunzio, and 'Paolo and Francesca,' by Stephen Phillips.

Darius, da-rī'ŭs, the name of several Persian kings, or, according to some writers, the royal title itself. Among the most distinguished individuals of this name are:

1. DARIUS, fourth king of Persia; d. 485 B.C. He joined the conspiracy against the False Smerdis, who had possessed himself of the Persian throne. After the conspirators had succeeded in getting rid of the usurper, they agreed to meet early the next morning, on horseback, and to appoint him king whose horse should neigh first after sunrise. The groom of Darius, apprised of this project, led his master's horse in the night with a mare to the appointed place, and, in consequence of this stratagem, the horse

of Darius neighed first the next morning. Darius was therefore saluted king, and the nation approved the choice. His reign was marked by many important events. The city of Babylon revolted, partly on account of burdensome impositions of tribute, and partly because the royal residence, under Cyrus, had been transferred thence to Susa. Darius besieged the city nearly two years without success, and was on the point of abandoning the siege when Zopyrus, one of his generals, by a heroic sacrifice, placed the city in his possession. After the subjection of Babylon Darius undertook an expedition, with an army of 700,000 men, against the Scythians on the Danube, who enticed him so far into their inhospitable country by their pretended flight, that he succeeded with difficulty in extricating himself and his army, after suffering great losses. Leaving a part of his forces under the command of Megabyzus in Thrace, to conquer that country and Macedonia, he returned with the remainder to Asia, to recruit at Sardis. In the year 501 B.C. a disturbance at Naxos, in which the Persians had taken part, occasioned a revolt of the Ionian cities, which the Athenians endeavored to promote, but which was suppressed by the capture and punishment of Miletus in 496. To revenge himself upon the Athenians, Darius sent Mardonius with an army, by the way of Thrace and Macedonia, against Greece, and prepared a fleet to make a descent upon its coasts. But his ships were scattered and destroyed by a storm in doubling Mount Athos, and the army was almost entirely cut to pieces by the Thracians. Darius, however, collected another army of 500,000 men, and fitted out a second fleet of 600 ships. Naxos was conquered, and Eretria, in Eubœa, sacked. Thence the army under Datis and Artaphernes proceeded to Attica, and was led by Hippias to the plains of Marathon. The Athenians had in vain besought assistance from their neighbors, and were obliged to depend upon their own resources alone. They marched forth, 10,000 strong, under the command of Miltiades, to meet the Persian army, and animated by the reflection that they were fighting for freedom and their country, obtained a complete victory (490 B.C.). This prince did much to improve the internal administration of his kingdom. In the year 508 B.C. he sent his admiral, Scylax, to explore the river Indus, and he encouraged commerce and arts by useful institutions and laws.

2. DARIUS II., king of Persia (surnamed Nothos, or the Bastard, by the Greeks): d. 404 B.C. He was an illegitimate son of Artaxerxes I. (Longimanus). He ascended the throne in 423, and suppressed several rebellions of his satraps; but Amyrtæus succeeded in maintaining himself in independent possession of Egypt, which had revolted in 414. His son Cyrus is familiar to us through Xenophon's 'Anabasis.'

3. DARIUS III., king of Persia (surnamed Codomannus). He was the great-grandson of Darius II., and the 12th and last king of Persia. He ascended the throne 336 B.C., when the kingdom had been weakened by luxury and the tyranny of the satraps under his predecessors, and could not resist the attacks of a powerful invader. Such was Alexander of Macedon; and the army sent against him by Darius was totally routed on the banks of the Granicus, in Asia Minor. Darius then advanced with 400,000 soldiers, to the plains of Mesopotamia. The Grecian mercenaries advised him to await the enemy here, as the level country would enable him to draw out his outforces to advantage; but Darius hastened forward to meet Alexander in the mountainous Cilicia. Darius was a second time totally routed, near the Issus 333 B.C. He himself escaped, under cover of the night, to the mountains. His mother, his wife, and three of his children fell into the hands of the conqueror, who treated them with great generosity. Darius was so far from being discouraged by these defeats that he wrote a haughty letter to Alexander, in which he offered him a ransom for the prisoners, and invited him to a new engagement, or, if he did not choose that, granted him permission to retire into Macedonia. Alexander then laid siege to Tyre, on which Darius wrote him another letter, offering him not only the title of king, which he had before refused to do, but also 10,000 talents ransom, and all the countries of Asia as far as the Euphrates, together with his daughter, Statira, in marriage. These propositions, however, were unavailing. Alexander subjected Egypt, and the two armies met between Arbela and Gaugamela, and after a bloody engagement Darius was compelled to seek safety in flight (331 B.C.). Alexander took possession of his capital, Susa, captured Persepolis, and reduced all Persia. Darius fled to the northern provinces, where he was seized by Bessus, one of his satraps, and afterward murdered.

Darjeeling, dăr-jēl'ĭng, **Darjiling,** or **Dorjilling** (the diamond thunderbolt land), (1) a district of India, in the extreme north of the province of Bengal; area 1,234 square miles. It lies on the southern slope of the Himalayas, and consists partly of mountain and valley, partly of a *terai* or marshy strip below the mountains, some of which are over 10,000 feet high. Coffee, cinchona, rice, and cotton are raised, and the cultivation of the tea-plant is rapidly extending; about 65,000 acres are now in tea plantations. Pop. (1891) 233,314. (2) The chief town in this district is Darjeeling, a celebrated sanatory station, and for several months of the year the residence of the lieutenant-governor and his staff. The Darjeeling & Himalayan Railroad connects it with Calcutta. Pop. 13,037.

Dark Ages, The, a period supposed to extend from the fall of the Roman empire, 475 A.D., to the revival of literature on the discovery of the Pandects at Amalfi in 1137. Not to draw the limits too finely, say 700 years (450 to 1150). The Middle Ages may be extended to about 1550, covering from 10 to 11 centuries.

Dark and Bloody Ground, The, a name frequently appied to the State of Kentucky. It is said to be a translation of the Indian words "Kain-tuk-ee," though some authorities claim that they signify "At the head of the river." The epithet was originally bestowed because the region was the scene of many sanguinary conflicts between the redmen of the northern and southern tribes. Later the constant feuds between white settlers and the aborigines rendered the phrase peculiarly appropriate to this locality.

Dark Continent, The, Africa, in allusion to the almost total ignorance concerning the people and geography of its interior which until quite recently prevailed in Europe and America. See AFRICA.

DARJEELING, INDIA, SHOWING THE HIMALAYA MOUNTAINS.

Dark Day, a name frequently used in this country in connection with 12 May 1780, but applied also to days on which similar phenomena have been discerned. On the date mentioned the atmosphere in New England was so obscured as to cause in some places cessation from outdoor labor. Birds and domestic fowls acted as during an eclipse. The darkness began at 10 and lasted until night, causing a feeling of alarm by its unprecedented nature. There appears to have been an absence of clouds for the most part, though light rain occurred. Though known as the Black Friday of New England, the area covered by darkness also extended west of that section.

Two dark days are recorded as occurring in America earlier than the Black Friday, one in 1716 and another in 1762. The Dark Days of Canada were 16 Oct. 1785 and 3 July 1814. On the latter date the darkness extended over a tract estimated to be about 300 miles in length and 200 in breath, in the region of the Saint Lawrence River and Gulf. There were showers of sand and very dark ashes and the atmosphere was of a deep yellow color. The characteristic features seemed to point to volcanic action as an origin rather than to forest fires. These two causes have in recent years received much attention in their relation to the obscuring and tinting of the atmosphere over immense areas. The smoke from great forest fires in the northwestern States and in Canada was in 1881 carried south or southeast to almost incredible distances and in June 1903 extensive fires in the forests of New England and of the Adirondacks caused a yellowish haze that extended far from its source. After the volcanic eruptions of Mount Soufrière and Mount Pelée in May 1902 vast quantities of volcanic dust were borne seaward, more or less obscuring the daylight by their persistence in the atmosphere. The volcanic dust from Krakatoa is believed to have encircled the entire earth and to have affected the color of the atmosphere for months. In countries situated like Egypt a marked obscuration of daylight may often be accounted for by the fine sand brought by winds from the desert.

Dark Horse, a phrase used in racing concerning a horse when its power of performance or chances of success are not generally known. The expression has been transferred to fields of human competition, and is frequently used in politics, especially in reference to candidates for nomination in a convention, when they are unexpectedly brought forward or draw a following that had not been anticipated.

Darke, William, American soldier: b. Pennsylvania 1736; d. Jefferson County, Va., 26 Nov. 1801. At 19 he served with the Virginians in the battle of Braddock's defeat, and afterward in the war of the American Revolution. At Saint Clair's defeat he commanded the left wing of the army, and made two gallant and successful charges with the bayonet, in the second of which his youngest son, Capt. Joseph Darke, fell mortally wounded (4 Nov. 1791). His father paused but a moment over him, and rushed with redoubled energy into the conflict. He was repeatedly a member of the Virginia legislature, and, as member of the convention of 1788, voted for the Federal Constitution.

Dar'laston, England, town in Staffordshire, included in the parliamentary borough of Wednesbury. It is an irregular, straggling place, engaged in the manufacture of iron for bridges, roofing, and railroads, and gun-locks, bolts, bars, screws, etc. Pop. (1901) 15,391.

Darley, Felix Octavius Carr, American artist: b. Philadelphia, Pa., 23 June 1822; d. Claymont, Del., 27 March 1888. His illustrations of literary masterpieces gave pleasure to thousands, and made him famous. His best work comprises his drawings to accompany the text of 'Rip Van Winkle'; 'Sleepy Hollow'; 'Courtship of Miles Standish'; 'Scarlet Letter'; 'Evangeline'; the novels of Cooper, Dickens, and others, besides many special pictures. His book 'Sketches Abroad with Pen and Pencil' (1868) is well known.

Darley, George, English poet: b. Dublin 1785; d. London 1849. He was graduated at Trinity College, Dublin, in 1811, went to London in 1825, and became attached to the 'Literary Gazette' and 'Athenæum' journals, in which his criticisms of poetry and the fine arts made him well known. He is the author of the 'Labors of Idleness'; 'Sylvia' (1822), and miscellaneous works of a mingled philosophical and poetic character.

Darling, Flora Adams, American novelist: b. Lancaster, N. H., 1840. She married Edward Darling, a Confederate officer, killed in the Civil War. She was one of the founders of the society of Daughters of the Revolution and has been prominent in that and other patriotic organizations. She has published: 'A Wayward, Winning Woman' (1890); 'Was it a Just Verdict?' (1890); 'The Bourbon Lily'; 'Mrs. Darling's Letters, or Memories of the War' (1894); 'A Social Diplomat' (1898); 'History D. A. R. and D. R. Societies of Patriotic Organizations' (1901); 'The Senator's Daughter,' etc.

Darling, Grace Horsley, English heroine: b. Bamborough, England, 24 Nov. 1815; d. 20 Oct. 1842. She was the daughter of the keeper of the Longstone Lighthouse. The event which made her famous occurred on 6 Sept. 1838. The steamer Forfarshire was wrecked near the lighthouse, and at daylight William Darling descried the wreck from Longstone, but accustomed to scenes of danger as he was, shrank from attempting to reach the wreck through a boiling sea in a boat. His daughter, who could see, by the aid of a glass, the sufferers clinging to the wreck, implored him to let her accompany him in the endeavor to relieve them. At last he consented; and father and daughter reached the wreck, and found nine sufferers, whom they succeeded in bringing to the lighthouse. The news of the heroic deed soon spread, and a purse of $3,500 was quickly subscribed and presented to the brave girl.

Darling (so called from a governor of New South Wales), a name of several applications in Australia. (1) The Darling River, a river rising in the northeast of New South Wales, is formed by the junction of several streams, and flows in a southwesterly and southerly direction till it joins the Murray at Wentworth. (2) Darling district is a pastoral district about 50,000 square miles in extent, in the southwest of New South Wales, and watered

by the Darling and the Murray. (3) The Darling Downs are a rich table-land west of Brisbane in Queensland, forming excellent pasture and arable land. It is well watered, and measures about 6,000 square miles. (4) The Darling Range, granite mountains in western Australia, running in a northerly direction parallel with the coast from Point D'Entrecasteaux for nearly 300 miles. Its highest peaks do not exceed 1,500 feet in height.

Dar'lington, William, American botanist: b. Birmingham, Pa., 28 April 1782; d. Westchester, Pa., 23 April 1863. He was a soldier in the War of 1812, and a member of Congress 1815–17, and 1819–23. He published a descriptive catalogue of plants in Pennsylvania: 'Flora Cestrica' (1837–53); 'Mutual Influence of Habits and Disease' (1804); 'Agricultural Botany' (1847); and in 1853 a genus of pitcher-plant found in California was named in his honor, *Darlingtonia Californica.*

Darlington, England, a municipal and parliamentary borough in Durham County. It is well built, chiefly of brick, and nearly in the form of a square, and has among its public buildings an ancient Gothic church with a lofty spire, founded in 1160, restored in 1865; corporation buildings, with a handsome clock-tower; market-house, hospital, an infirmary, a technical college, mechanics' institute and library, a grammar-school, a girls' training college, etc. A free library was established in 1885. The woolen manufacture is carried on to a considerable extent, and there are large manufactories of iron, steel, locomotives, materials for bridges and railroads. The town is on the Stockton & Darlington Railroad (now part of the North Eastern system) which was the first line in England on which locomotive steam-engines were used. Pop. (1901) 44,496.

Darlington, S. C., town, county-seat of Darlington County, on the Atlantic Coast Line Railroad, about 80 miles northeast of Columbia. It is in an agricultural region, and is a trade centre for tobacco, cotton, corn, and other products. The manufactures are chiefly cotton goods, tobacco, and fertilizers. Pop. (1902) 3,652.

Darlingto'nia, a genus of pitcher-plants, belonging to the order *Sarraceniacæ* (sarraceniads). The *D. californica* grows in the northern part of California, chiefly in the district around Mount Shasta. It is found in boggy places on the slopes of mountains. It entraps insects, which are attracted to the curious pitcher or hood at the extremity of the tubular leaves; and, once inside, are prevented by the fine hairs which point downward from returning. Sometimes the leaf-stems at their base are filled to the depth of four or five inches with insect remains. The larva of a small moth *Xanthoptera semicrocea,* preys on the plant, and that of a dipterous insect, *Sarcophaga sarraceniæ,* feeds on the dead insects which it encloses. See CARNIVOROUS PLANTS.

Darmestet'er, Agnes Mary Frances Robinson, English poet: b. Leamington, England, 27 Feb. 1857. She has attained great proficiency in Greek studies, her verse showing the influence of Hellenic literature. In 1888 she married James Darmesteter (q.v.), the Orientalist, who died in 1894, and in 1901 she married Emile Duclaux, director of the Pasteur Institute in Paris. Her writings include: 'A Handful of Honeysuckle' (1878); 'The Crowned Hippolytus, from Euripides' (1881); 'Arden,' a novel (1883); 'Emily Bronte' (1883); 'The New Arcadia and Other Poems' (1884); 'Margaret of Angouleme, Queen of Navarre' (1885); 'An Italian Garden' (1886); 'The End of the Middle Ages: Essays and Questions in History' (1888); 'Songs, Ballads and a Garden Play' (1888); 'Lyrics' (1891); 'Retrospect' (1893); 'Life of Renan' (1897); 'A Mediæval Garland' (1897); 'Collected Poems' (1901); and in French, 'Marguerites du Temps Passé' (1892); 'Froissart' (1897); 'Grands Ecrivians d' Outremanche' (1901).

Darmesteter, där-mē-stē-tär, **James,** French Orientalist: b. Château-Salins, 28 March 1849; d. Maisons-Lafitte, near Paris, 19 Oct. 1894. Besides works of strict scholarship on the Oriental literatures, as 'Ormazd and Ahriman' (1877); 'Iranian Studies' (1883); 'Origins of Persian Poetry,' he wrote many essays on miscellaneous subjects. There is an English translation of some of his 'Selected Essays.' He translated with Mills the 'Zend-Avesta' for the 'Sacred Books of the East' series, published by the University of Oxford and edited by Max Müller.

Darmstadt, därm'stät, Germany, capital of the Grand duchy of Hesse, near the Darm River, 15 miles south of Frankfort. It consists of an old and a new town. The former, which is the business part of the town, is very poorly built; the houses are old, and the streets narrow and gloomy. The new town is laid out with great regularity, and has handsome squares and houses. Among the remarkable buildings are the old palace (with a library of 500,000 volumes and 4,000 MSS., a picture gallery, and a rich museum of natural history), the Roman Catholic Church, patterned after the Pantheon, the Stadtkirche, and the Rathhaus, or town-hall, built in 1580. Darmstadt has some iron foundries, breweries, and other manufactures, and its industries are increasing, but it depends more upon the residence of the court than upon either trade or manufactures. It owns its own electric and gas plants, and its schools and charitable institutions are numerous for its population. Justus von Liebig, the scientist, was born here in 1803. Pop. (1900) 72,381.

Dar'nel, the popular name for *Lolium tenulentum,* which some suppose to be the *Infelix lolium* of Virgil and the *Zizania* (tares) of Scripture. It is believed by the ancients to be poisonous and narcotic. It is common in waste places and fields in America from New Brunswick to Georgia and northwestward to Michigan. It is remarkably abundant on the Pacific Coast and is generally a troublesome weed. It has been naturalized from Europe.

Darnley, Henry Stuart, Lord, husband of the Scottish queen, Mary Stuart: b. England 1546; d. Edinburgh 10 Feb. 1567. His father, the Earl of Lennox, was descended from a branch of the house of Stuart; his mother, Margaret Douglas, was the daughter of Margaret of England, sister of Henry VIII. Darnley, though devoid of real merit, had, by his personal attractions, won Mary's heart, but it was an unfortunate match; and ere long gave rise first to coolness, then to open quarrel, and finally to deadly hate. Darnley thought, or affected to

think, that her regard for David Rizzio was of a kind which no husband ought to tolerate, and leagued with a body of conspirators, who, on 9 March 1566 dragged Rizzio from the queen's presence, and murdered him under circumstances of horrid barbarity. About the end of that year Darnley was seized with smallpox. In January Mary had him conveyed to an isolated house called Kirk of Field, which stood at some distance from Holyrood. This dwelling, which belonged to a retainer of Bothwell's, the rapidly rising favorite, was blown into the air with gunpowder. The dead bodies of the king and his page were found in a field at a distance of 80 yards from the house, quite free from any mark which such an explosion would cause. Previous to this tragedy a son had been born of the marriage, who afterward united the Scotch and English crowns under the name and title of James I. of England and VI. of Scotland.

Darrow, Clarence S., American lawyer: b. Kinsman, Ohio, 18 April 1857. He was admitted to the bar in 1875, and for some time filled the position of attorney for the Northwestern Railroad Company. He has been very prominent in legal practice, and been retained in many cases against monopoly, as for example in the case against the Gas Trust in Chicago. He is an active politician, being identified with the Independent Democrats. He has written a volume of essays, entitled 'The Persian Pearl,' and many brochures on topics relating to political economy and the social structure.

Dart, a javelin, a short missile weapon thrown by the hand, or impelled by the breath, through a tube. Dart-heads are usually made of iron, but among savage nations flints, sea-shells, fish-bones, and other hard substances have been employed; and among some of the aboriginal inhabitants of the United States and Africa, the dart was merely a sharp-pointed stick, the end of which was carbonized by fire. The weapon is always very simple in its construction, and is usually from three to five feet long.

Darter, a name given to water birds of a small family (*Plotidæ*), found in the southern United States, in Africa, Asia, and Australia. The American species (*Anhinga anhinga*), also called the snake-bird and water-turkey, is especially common in Florida, and extends northward to North Carolina and Illinois. In appearance and habits the darter resembles the cormorant, especially in the structure of the feet, wings, and tail; the bill and neck are like those of the heron, the neck, owing to a peculiar anatomical mechanism, being remarkably flexible. The general color of the body is dark glossy green with silvery gray markings; wings and tail, bluish-black. The tail is rather long and consists of 12 narrowly wedge-shaped quills. Their haunts are in low swampy localities, by the side of murky streams. They generally perch on trees whose branches dip into the water. They are the best fresh-water divers known, and drop into the water with such surprising skill that the large body makes scarcely any noise, and but little ripple on entering the water. When swimming, its body is submerged, and the only part visible is the long neck, writhing about like an aquatic serpent, from which peculiarity its name of snake-bird. Its food consists of small fish, shrimps, young reptiles, leeches, etc. The quantity of fish it can consume is enormous; but like other bird feeding on fish and flesh, it can remain several days without food with impunity. It captures fish, not by diving upon them from above, but by pursuing them under water and spearing them with its closed beak. A bulky nest of sticks, roots, etc., is placed in a tree and receives three or four white chalky eggs.

Darters, small fresh-water fishes forming a sub-family of the *Percidæ* (q.v.), from the typical members of which they are distinguished by having the pseudobranchiæ (opercular gills) imperfect or absent, the margin of the gill-cover smooth, the skull less perfectly ossified, etc. They have been described as perches reduced in size and compacted. The *Etheostomatinæ* are peculiar to North America, where 15 genera and about 80 species occur, mostly in rocky rills and clear mountain brooks too small to be occupied by other fishes. They are among the smallest of fishes, some of the species being less than two inches, and the largest — the so-called log-perch (*Percina caprodes*) of the Great Lake region and Mississippi Valley, only six to eight inches long. The typical and largest genus is *Etheostoma.*

The darters spend most of their time resting on their fins on the bottom, hiding beneath stones, or burying themselves in the sand, leaving only the eyes uncovered. Owing to the protective resemblance of their markings to the bottom, they are difficult to distinguish. When disturbed, most of the species dart for a short distance with the greatest rapidity, and again settle on the bottom in a quiescent state. These little fishes are among the most interesting inhabitants of our fresh waters, and a valuable account of their habits will be found in a paper by Jordan and Copeland in the 'American Naturalist' for 1876.

Dartford, England, a market-town of Kent, in the narrow valley of the Darent River, two miles above its entrance into the Thames, and 17 miles east southeast of London. Edward III. here founded an Augustinian nunnery (1355); St. Edmund's chantry was a great place of pilgrimage; and at Dartford, Wat Tyler began his rebellion (1381). Spielman built here the first paper-mill in England (1590). There is considerable manufacturing, chief of which are the cotton goods, powder, paper, and corn meal, iron and iron products, oil, and chemicals. Pop. (1902) 18,965.

Dart'moor, an extensive, rugged, mountainous tract in England, in the western part of Devonshire, often called the "Forest of Dartmoor," but at present having no appearance of a forest, except what is afforded by some dwarf oaks, intermixed with ash and willow; reaching from Brent south to Oakhampton north, 22 miles, with a breadth of about 20 miles, and occupying from 130,000 to 150,000 acres. In the centre of the moor there is an extensive swamp in which the rivers Dart, Teign, Taw, Yealm, Erme, and a great number of smaller streams have their source. Cattle and sheep are fed on the coarse grass during the summer months. In the winter the storms from the Atlantic sweep over it, and it would be difficult to imagine a more desolate-looking place. Several of the rugged granite hills (here called "tors") are of considerable height, Yes Tor rising 2,050 feet above the plain. The district is noted as

being the site of a prison built in 1809 for the custody of the French prisoners of war at a cost of $635,000. At one time it contained 10,000 inmates. It covers an area of 30 acres, and is now fitted up for the reception of convicts. Experiments made in cultivating the moor by convict labor have turned out successfully. The large kaolin-works and a meteorological observatory are at Lee Moor. Dartmoor offers considerable attraction to the tourist and naturalist. Druidical and other aboriginal remains may be traced, especially Gray Wethers, which is thought to have been a Druidical temple. The dolmens, cairns, and other indications of an ancient town, are found at Drewsteignton. Since 1337 Dartmoor has been annexed to the duchy of Cornwall.

Dartmoor Massacre, The, 6 April 1815. During the War of 1812 the American naval prisoners of the British, with impressed American seamen discharged from British vessels, were collected at Dartmoor military prison. On 31 March 1815 they numbered 5,693, including about 1,000 negroes. They had heard of the Peace of Ghent, 24 Dec. 1814, and expected immediate release; but the British government refused to let them go on parole, or take any steps till the treaty was ratified by the Senate, 17 Feb. 1815. It took several weeks for the American agent to secure ships for their transportation home, and the men grew very impatient. On 4 April the dishonest food contractor attempted to work off some damaged hardtack on them in place of soft bread, and was forced to yield by their insurrection, and the commandant, Capt. T. G. Shortland, suspected them of a design to break jail. This was the reverse of truth in general, as they would lose their chance of going on the cartels; but a few had made reckless threats of the sort, and the commandant was very uneasy. About 6 P.M. of the 6th he discovered a hole from one of the five prisons to the barrack yard near the gun-racks. Others had been begun, apparently for pastime. Some prisoners were outside the guard railing noisily pelting each other with turf, and many more near the breach (and the gambling tables), though the signal for return to prisons had sounded: altogether he was convinced of a plot, and rang the alarm bell to collect the officers and have the men ready. This luckless precaution brought back a crowd just going to quarters; just then a prisoner broke a gate-chain with an iron bar, and a number pressed through to the prison market square; and after attempts at persuasion, Shortland ordered a charge which drove part of the prisoners in. Those near the gate, however, hooted and taunted the soldiery, who fired a volley over their heads; the crowd yelled louder and threw stones, and the soldiers, probably without orders, fired a direct volley which killed and wounded a large number. Then, losing their heads, they followed the throng of prisoners struggling frantically to get within the prison doors, shooting them down as they went, some even going up to the doors and firing in; while others ran up to the walls and fired into the fleeing knots below. Finally the captain, a lieutenant, and the hospital surgeon (the other officers being at dinner) succeeded in stopping the murder and caring for the wounded — about 60, 30 seriously, besides 7 killed outright. The affair was examined by a joint commission, Charles King for the United States and F. S. Larpent for Great Britain, who agreed in exonerating Shortland, justifying the first firing, blaming the subsequent, and pronouncing the culprits undiscoverable. The British government provided for the families of the killed, pensioned the disabled, and promoted Shortland. Consult: Charles Andrews, 'The Prisoners' Memoirs; or Dartmoor Prison'; Cobb, 'A Green Hand's First Cruise, Together with Five Months in Dartmoor.'

Dart Moth, a name applied to the genus *Agrotis,* a night-flying moth of destructive habits, the caterpillar of which is widely known as the cut-worm (q.v.) A European species is the winter dart moth which destroys wheat. The American group includes several species, most of which appear about midsummer.

Dartmouth, därt'müth, Canada, town of Halifax County, Nova Scotia; at the mouth of a small river flowing into Halifax Harbor, opposite Halifax, of which it is practically a suburb. It has fine private residences, churches, and schools, and is the seat of the Provincial Asylum for the Insane. The chief manufactories are iron foundries, rolling mills, a sugar-refinery, tanneries, rope works, a brewery, soap and cocoa works, molasses blending works, boiler works, marine railway works, and flour mills. The municipality controls its steam ferry to Halifax and the water and sewerage works. Fort Clarence, below the town, defends the dangerous Eastern Passage into the harbor. Dartmouth was destroyed by the Indians two years after its founding in 1749, but afterward rebuilt. Pop. (1901) 4,806.

Dartmouth College, a seat of learning in Hanover, N. H., which received its charter in 1769, and opened its doors the following year under the presidency of Eleazer Wheelock, D.D. It grew out of an earlier school established by Eleazer Wheelock in Lebanon, Conn., and designed for the education of Indian children. The idea of this school had been suggested to him by his success in educating a young Mohegan Indian, Samson Occom, who became a remarkable preacher. Other pupils from several Indian tribes were afterward received and the school became an object of public attention and interest. In 1754, a farmer named Joshua Moor gave a house and two acres of land for the purposes of the institution, which was from this time known as Moor's Indian Charity School. Occom, accompanied by the Rev. Nathaniel Whitaker, visited England to collect funds; a sum of over $50,000 was subscribed, and a board of trustees was there organized, of which Lord Dartmouth, one of the subscribers, was made president. The school was so much resorted to by the native tribes that Dr. Wheelock determined to transfer to some place near to them. Many offers of situation were extended to him, but he selected the town of Hanover, on the Connecticut River, in the western part of the State of New Hampshire, and grants of about 44,000 acres of land were made to him. The institution was chartered by Gov. Wentworth under the name of a college, with all the privileges and immunities of any university within the British realm, and was called Dartmouth College in honor of the Earl of Dartmouth. Moor's school soon afterward obtained an in-

1. Wilson Library.

2. Faculty Avenue.

dependent charter, and still remains as an academical or preparatory department. In 1770 Dr. Wheelock removed his family and school, consisting of 18 whites and 6 Indians, from Lebanon to the wilderness of Hanover, where the whole colony lived in log huts. In 1771 the first class of four students was graduated. President Wheelock retained his office till his death in 1779, and was succeeded by his son, John Wheelock, who, in 1782, was sent by the trustees to Europe to promote the interests of the college; and through introductions by Gen. Washington, Dr. Franklin, and John Adams, he obtained considerable sums of money, philosophical instruments, and other valuable donations. William, Prince of Orange, was one of the donors. Wheelock returned in 1784, and after a presidency of 36 years was removed from the office by the trustees, in 1815. This act, which had its origin in a local religious controversy, led to a conflict with the legislature of the State; that body claimed the right to amend a charter of which it was the guardian, and in 1816 passed acts creating a new corporation, in which the property was vested, and changing the title of the college to Dartmouth University. The old trustees began a suit for the recovery of the college property. (See DARTMOUTH COLLEGE CASE.) Wheelock, who was succeeded as president of the college by Francis Brown, was raised to the presidency of the university, in February 1817, by the trustees of that institution, but died within two months. He was succeeded by William Allen, D.D., and in 1819 the "College Case" was decided in favor of the college, when the university disbanded.

Dartmouth College still remains an institution for men only. It comprises, besides the regular classical department: the medical school, founded in 1798; the "Chandler School of Science," established in 1851, by the trustees, on the receipt of a bequest of $50,000 from Abiel Chandler, who left it to them in trust "for the establishment and support of a permanent department or school of instruction in the college, in the practical and useful arts of life." The course in this school, leading to the degree of bachelor of science, covering four years, and including courses in general science, political science, modern languages, mathematics, and history, was brought into close relation with the academic course in 1893. Another department is "The Thayer School of Civil Engineering," founded in 1867 by Sylvanus Thayer, a graduate of Dartmouth. This is a graduate school, comprising a two years' course in civil engineering. The government of this school is vested in a board of five overseers, of whom one is the president of Dartmouth College. In 1900, the trustees created the "Amos Tuck School of Administration and Finance," according to the terms of the Amos Tuck Endowment Fund, the gift of $300,000 by Mr. Edward Tuck, of the class of 1862, as a memorial to his father, of the class of 1835. This school is post-graduate in nature and is established in the interest of college men who desire to engage in affairs rather than enter the professions. The report of the college for 1905 gives the following statistics: Professors, 87; number of students, 926; volumes in library, 100,000, and 20,000 pamphlets; and value of property including endowments, $3,500,000.

CHARLES F. EMERSON,
Dean of Faculty.

Dartmouth College Case, The. The Dartmouth College Case is the name by which is commonly known the action entitled Trustees of Dartmouth College *v.* Woodward, which is reported in volume four of Wheaton's United States Supreme Court reports. Perhaps no decision ever rendered in any tribunal has attracted more attention or exerted a greater influence over the legislative and judicial history of our land than has the decision in this case, which arose as follows:

In the year 1769 the Reverend Eleazar Wheelock, aided financially and politically by friends in England and America, conspicuous among whom was the Earl of Dartmouth, and with the assistance of the Province of New Hampshire, given in the form of extensive land grants, founded Dartmouth College under a charter from King George III. of England. This charter vested the control of the institution in a board of trustees, who were designated by Mr. Wheelock to manage the same, and under the management of those trustees so incorporated and their successors the college grew and prospered until, the year 1815, when the State legislature passed an act amending its charter by which they curtailed the power of its trustees, changed its name to Dartmouth University and made it a State institution subject to State control. For protection against this infringement of their powers, the trustees had recourse to the courts in the now famous case above named.

In the State tribunals the decision went against the college trustees and an appeal was taken to the Supreme Court of the United States, the appeal being based upon the theory that the charter granting the control of the college to the trustees was a contract, that under Section X. of Article 1 of the Federal Constitution no State can pass an act impairing the obligation of any contract, and that the said act of the New Hampshire Legislature violated the contract of the charter of Dartmouth College.

It should be remembered that in 1819 when the case came up for final hearing, the popular views of the scope and effect of the National Constitution were far from harmonious. All then regarded that instrument as the greatest existing governmental compact, but the Republican party then in power demanded that it be so strictly construed as to preserve unimpaired the rights and powers of the individual States. On the other hand, there then presided over the Federal Supreme Bench, in the person of John Marshall, one of the "midnight appointees" of John Adams, the last President of that Federalist party which demanded so liberal a construction of the instrument as to give the country a strong national government. Of the section of the Constitution invoked, we may safely say with Ordronaux that "Drafted at a time when commerce was in its infancy; when public credit was depreciated to the lowest ebb; and confidence in monetary transactions almost destroyed, it was manifestly introduced as a barrier against the tide of repudiation which threatened to overwhelm both public and private credit." The framers of the Constitution never intended that clause to be given the interpretation urged in this case. But the case was up before a court

presided over by the jurist who has been truthfully said to have "found the Constitution a skeleton and clothed it with flesh and blood." Therefore, when it was clearly shown, as it was in the celebrated argument of Daniel Webster for the college trustees, that this case came fairly within the provisions of that section, in principle, the court, guided by John Marshall, held that the act of the New Hampshire Legislature was void because it impaired the obligation of a contract. Justice Duvall alone dissented.

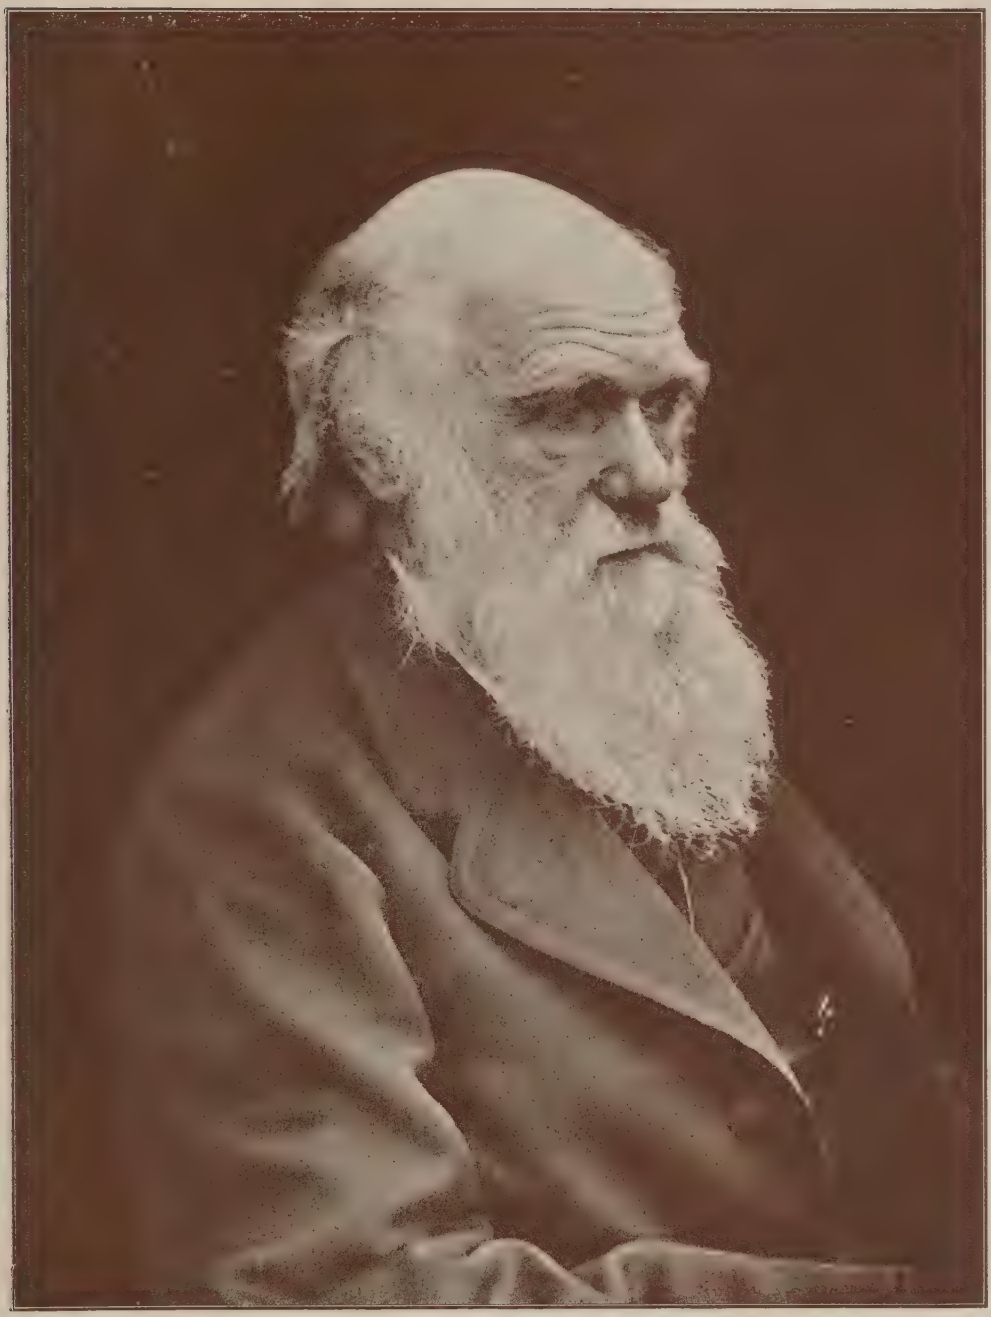
This decision has perhaps been more severely criticised and has perhaps given rise to more strenuous efforts to escape its consequences than has any other decision of the tribunal which rendered it, and the reasons are obvious. While it gave assurance that capital invested in chartered business and charitable ventures would be forever protected from legislative interference, it also invited political corruption by saying in effect to promoters of corporations that the courts would protect them in the possession of every concession or right which they beguiled from pliant legislative bodies. It made possible the mechanical and industrial achievements of the 19th century in this country, but it also made profitable the limitless corruption which has attended those achievements and which has frequently, by virtue of this decision, stripped the government of very important powers.

But the correctness of a judicial decision is not to be gauged by its influence for weal or woe. Rather should that be determined by its conformity to the Constitution, the statutes and the judicial precedents upon which it rests and the approval given it by later decisions. Judged by this test we must hold that Marshall and his colleagues decided well in the Dartmouth College Case. The Supreme Court of the United States had early laid down the rule that there are certain vital principles of republican government which will overrule a flagrant and apparent abuse of legislative power. It had in the year 1810 declared a law granting land to private companies to be in effect a contract which could not be so repealed as to impair the obligation of that contract. If the passage of the law were procured by fraud the court there doubted its power to declare it void for those reasons, but if that power existed it could be exercised only under those rules of law and equity which govern private transactions. Two years later there came before the same court a case involving a somewhat similar question. The State of New Jersey had traded land with an Indian tribe and had, by legislative enactment, provided that the Indians should forever hold the lands received by them free from taxation. With the consent of the State they sold their lands and, the question being properly presented, the court held that the law granting the exemption was a contract, that the exemption ran with the land and that the purchasers from the Indians enjoyed the same exemption.

By the decision in the Dartmouth College Case the rules laid down in the foregoing cases were followed and their application extended to contracts in charters of incorporation, but their force when so applied had already been limited by another line of decisions. In 1804 Chief Justice Marshall, speaking for the court, had said that the charter gives to a corporation all of the powers it possesses and no powers not granted can be exercised. A little later he had decided that there is a difference between a grant of corporate existence and a grant of peculiar remedies. The first is general. The second can only be exercised in those courts which the power bestowing the privilege can regulate. Moreover, as the bank charter involved in that case contained a clause making it a felony to counterfeit its notes, the court believed it to be a public act and subject to repeal by succeeding legislatures. And in the year 1819 the same court had decided that the right to use a peculiar form of attachment granted in its charter to a bank could be taken away at any time because "The forms of administering justice and the duties and powers of the courts as incident to the exercise of a branch of the sovereign power must ever be subject to the legislative will and the power over them is inalienable so as to bind subsequent legislatures."

It is thus made fully apparent that the Dartmouth College Case decided only that if a legislative grant, whether made in the form of a charter of incorporation or in any other form, conveyed to private citizens that which the legislature had power to contract away, the grant so made was a contract and no succeeding legislature could rescind the same without following the same rules which govern the rescission of private contracts. But if there is any doubt that such was the understanding of the chief justice who wrote the opinion of the court in that case, the same will be removed by a consideration of certain later decisions in which he participated. In the year 1821 the court over which he presided decided that Congress had power to incorporate a lottery to do business beyond the limits of the District of Columbia, yet, where no mention was made thereof in the charter, it would not be presumed that Congress had done so and had thereby deprived the States of their power to regulate lotteries by preventing the sale of tickets within their boundaries. In the same year the same court decided that a town government cannot contract away its legislative power. And in the case of Providence Bank *v.* Billings, the court presided over by Marshall decided that while a State might, through its legislature, grant immunity from taxation, it could not be presumed to have done so, and that, in the absence of any agreement to the contrary, it might tax to death a franchise which it had itself granted.

But the effect of the Dartmouth College decision was not fully understood at the time of its rendition and the States eagerly availed themselves of a suggestion found in the decision itself to the effect that if they wished the right to amend, alter or repeal charters granted by them they must expressly reserve that power. Such a reservation, whether expressed in the charter itself, the constitution or the general laws of the State, has been held to have the effect of "placing the State legislature back on the same platform of power and control over the charter containing it, as it would have occupied had the constitutional restriction never existed." Yet the later decisions hold that this reserve power must be reasonably exercised. The alterations must be made in good faith and consistent with the objects and scope of the act of incorporation. Sheer oppression and fraud cannot be inflicted under the guise of amendment or alteration. This power cannot be so



CHARLES DARWIN.

employed as to defeat or substantially impair the object of the grant or any right which has become vested under it. Where this power has been reserved, a State may tax property which it has forever exempted from taxation, but the taxes must not be greater than those imposed upon other property. It can regulate the charges of common carriers, but no such legislation must amount to the taking of private property for public purposes without due process of law. We thus see that not only was the Dartmouth College decision as moderate as any of the later cases which have been said to have practically overruled it, but that even where reservations in charters have obviated the effect of that decision the later courts have reached a similar conclusion by a different chain of logic.

S. V. Wright,
Attorney, San Luis Obispo, Cal.

Darton, Nelson Horatio, American geologist: b. Brooklyn, N. Y., 17 Dec. 1865. He received a common school education and became a chemist and later a geologist. He has made many geological surveys for the United States Government. His chief work is 'Catalogue of North American Geology, 1732–1891.' Since 1890 he has been connected with the United States Geological Survey.

D'Arusmont, dä-rüs-môn, **Madame Frances** (maiden name Fanny Wright), American philanthropist and author: b. Dundee, Scotland, 6 Sept. 1795; d. Cincinnati, Ohio. She married M. d'Arusmont in 1838, but the marriage was not a congenial one and her later years were spent in the United States. She lectured extensively on social, religious, and political questions. Among her works are: 'Views on Society and Manners in America'; 'Altorf,' a tragedy (1819); 'Lectures on Free Inquiry' (1836).

Darwar, där'wär, or **Dharwar,** India, a town and fortress in the district of Bombay, 285 miles southeast of Bombay city, capital of a district of the same name. The town exports cotton and rice. It is connected by railroad with Goa, the Portuguese colony, and with other places. Pop. (1901) 31,279. The district of Darwar has an area of 4,603 square miles. The soil and climate are well adapted to the cultivation of cotton. Pop. 1,051,314.

Dar'wen (till 1889 Over Darwen), England, a municipal borough in the county of Lancaster. It has among its public buildings numerous churches and chapels, a market-house, public baths, free library, theatre, technical-school, hospitals, etc. The staple manufacture is cotton. The other manufactures are paper, iron castings, machinery, earthenware, etc. The water, electric, and gas plants are owned by the city. Pop. (1901) 38,211.

Darwin, Charles Robert, English naturalist: b. Shrewsbury, 12 Feb. 1809; d. Down, Kent, 19 April 1882. His father, Robert Waring Darwin, was a distinguished physician of that town, the son of a still more distinguished father, Erasmus Darwin (q.v.) He was educated at Shrewsbury school, and at the universities of Edinburgh and Cambridge. He early devoted himself to the study of natural history, and in 1831 was appointed naturalist to the surveying voyage of H.M.S. Beagle, comanded by Captain (afterwards Admiral) Fitzroy. He served without salary, and paid a portion of his expenses on condition of having at his own disposal such collections of specimens as he might make during the voyage. The vessel sailed in December 1831, and did not return till October 1836, after having circumnavigated the globe. Darwin came home with rich stores of knowledge, part of which he soon gave to the public in such works as his 'Journal of Researches into the Natural History,' etc. (1839), of the countries visited, the 'Zoology of the Voyage of the Beagle' (1840–42); 'Structure and Distribution of Coral Reefs' (1842); 'Volcanic Islands' (1844); 'Geological Observations' (1846). Though known among naturalists as a man of distinguished ability, to the general public his name was not familiar, when all at once it attained a celebrity second to none by the publication in 1859 of 'The Origin of Species by Means of Natural Selection.' This work, scouted and derided though it was at first in certain quarters, may be said to have worked nothing less than a revolution in biological science. In it for the first time was given a full exposition of the theory of evolution as applied to plants and animals, the origin of species being explained on the hypothesis of natural selection. The central idea of the work is that all forms of organic life are derived from a small number of primitive types, and that all the vast variety of vegetable and animal organisms now existing, or having formerly existed, have owed their origin to the slow and gradual operation of the modifying influence of local or special causes transmitted hereditarily; such forms as best suit any particular time and locality being selected and adapted by the action of natural laws for that time and locality. The theory of evolution was warmly taken up by some of the ablest men of science, and now there are few who have not in whole or in part given in their adherence to the principle. The rest of his works are largely based on the material he had accumulated for the elaboration of the great theory. See Darwinian Theory. The principal are a treatise on the 'Fertilization of Orchids' (1862); 'Domesticated Animals and Cultivated Plants'; or 'The Principle of Variation, etc., under Domestication' (1867); 'Descent of Man and Variation in Relation to Sex' (1871); 'The Expression of the Emotions in Man and Animals' (1872); 'Movements and Habits of Climbing Plants' (2d ed., 1875); 'Insectivorous Plants' (1875); 'Cross and Self-Fertilization' (1876); 'Different Forms of Flowers' (1877); 'The Power of Movement in Plants' (1880); 'The Formation of Vegetable Mould' (1881); the latter dealing exhaustively with the common earthworm. Darwin was buried in Westminster Abbey. See 'Life and Letters of Charles Darwin' (1887).

Darwin, Erasmus, English physician and poet: b. near Newark, Nottinghamshire, 12 Dec. 1731; d. near Derby, 18 April 1802. Settling at Lichfield he acquired a great reputation and an extensive practice. His son, Robert, was father of the famous Charles Darwin. Erasmus Darwin's name is chiefly remembered for his poem of 'The Botanic Garden,' which is comprised in two parts; the first treats of the 'Economy of Vegetation' (1792), the second of the 'Loves of the Plants' (first published in 1789). It was received with much favor; but a very ingenious parody, entitled: 'The Loves of the Triangles,' published in the 'Anti-Jacobin' (and written either by Canning or Frere), greatly damaged its popularity. In 1794 Dr. Darwin published the first volume of 'Zoonomia, or the Laws of Organic Life'; the second volume, completing the work, appeared two years afterward. In 1799 he published 'Phytologia, or the Philosophy of Agriculture and Gardening.'

Darwin, Francis, English botanist: b. Down, Kent, 16 Aug. 1848. He is the son of Charles Robert Darwin (q.v.); was educated at Trinity College, Cambridge, and studied medicine at St. George's Hospital in London. He did not practise medicine, but assisted his father in his work at Down, and was later made reader in botany at Trinity College. His works include: 'Life and Letters of Charles Darwin' (1887); 'Charles Darwin' (1892); 'Practical Physiology of Plants' (with E. H. Acton 1894); 'Elements of Botany' (1895); and a number of papers on botanical subjects.

Darwin, George Howard, English scientist: b. Down, Kent, 9 July 1845. He is the eldest son of Charles Robert Darwin (q.v.); was educated at Cambridge, studied law and was admitted to the bar, but did not practise. He was a fellow of Trinity College, Cambridge, 1868–78; was a member of the expedition to Sicily to observe the eclipse in 1870–71; and was appointed Plumian professor of astronomy and experimental philosophy at Cambridge in 1883. Among his writings are: 'Small Deflections of the Plumb Line due to the Movement of the Earth'; 'Periodic Orbits' (1896); 'Tides and Kindred Phenomena in the Solar System' (1898), etc. He was knighted by King Edward in 1905.

Darwinian Theory, the explanation of the working of natural selection in effecting specific changes in plants and animals. "Darwinism" must not be confused with "Evolution." The term Darwinism is applied to one particular interpretation of the mechanism of the universe, and is summarized in Darwin's great work: 'The Origin of Species by Means of Natural Selection.' Whatever may be the future development of our evolutionary ideas, the epoch-making importance of the Darwinian theory will be unaltered.

Outline of Origin of Species.—To gain an insight into the means of modification, Darwin begins with a study of the variation of plants and animals under domestication. Those who admit the unity of domestic races should be cautious in denying the unity of the wild ones. Domestic races all exhibit adaptations to man's use or fancy, rather than to their own good. The key to this is man's power of selection. Nature gives successive variations, man accumulates these, so making for himself useful breeds, and often (for example, in sheep, cattle, roses, dahlias) profoundly modifies their character even in a single human lifetime; so that in all the characteristics to which he pays attention they may differ more than the distinct species of the same genera. Unconscious selection, which results from everyone trying to possess and breed the best animals, is even more important than conscious selection. Two flocks of Leicester sheep kept equally pure appear quite different varieties after 50 years. Such slowly accumulated change explains why we know so little of the origin of domestic races; and its absence in regions inhabited by uncivilized man explains why these yield no plants worth immediate culture. Human selection is facilitated (1) by the keeping of large numbers, since variations will be more frequent; and (2) by preventing free intercrossing. Some species vary more than others.

Variation Under Nature.—No two blades of grass are alike, and far more marked differences often occur, several strains or varieties sometimes existing in the same species. Between these strains, and much more frequently between forms which systematic botanists and zoologists rank as true species, perfectly intermediate forms may occur. No agreement about the definition of species (the amount of difference necessary to give any two forms specific rank) has ever been reached. Individual differences are of the highest importance, as the first steps toward the slightest varieties worth recording; these in turn toward more distinct and permanent varieties; these varieties again toward sub-species, and in the next stage to species, though extinction may often arrest the process. The species which present most varieties are those which have the greatest geographical range, or the widest diffusion in their own territory, or which possess the greatest number of individuals.

Struggle for Existence.—All organic beings tend to increase with extreme rapidity, so that if they were not kept down, the earth would soon be covered by the progeny of a single pair. Since organisms are reproducing themselves so rapidly, and not all their offspring can escape their enemies, get food and live, much less leave progeny in turn, there must in every case be a struggle for existence, either of one individual with another of the same species, with the individuals of distinct species, or with the physical conditions of life; often with all these at once, and that more or less intensely throughout the whole duration of life. The checks which prevent increase are more obscure, and vary in each case. In all cases the amount of food gives the limit. The youngest organisms generally suffer most. The stock of game on an estate depends chiefly on the destruction of vermin. Climate is important, and periodic seasons of extreme cold and drought seem the most effective of all checks. Epidemics too may occur, especially where numbers have inordinately increased. The struggle for life is most severe among individuals and varieties of the same species, and among the species of the same genus, since these tend to fill the same place in the economy of nature. The structure of every being is related to that of the others with which it competes, or from which it seeks to escape, or on which it preys.

Natural Selection.—The natural process which results in the preservation of favorable variations, and the elimination of injurious ones, is termed by Darwin "Natural Selection," or less

figuratively by Spencer, the "Survival of the Fittest." No country can be named where the native inhabitants are perfectly adapted to their conditions and competitors, for as some foreigners have taken firm possession in every country, we may safely conclude that the natives might have been modified with advantage to resist them. Human selection acts only for man's own good, on mere external and visible characters, and irregularly throughout a short period; natural selection acts for the good of the being itself, on the whole machinery of its whole life, and incessantly on the species, throughout almost infinite time. It leads to the improvement of each creature in relation to its organic and inorganic conditions of life, and consequently in most cases to what must be regarded as an advance in organization. The circumstances favorable to the production of new forms are great variability; large numbers of individuals; the complex effects of intercrossing; isolation in small areas; also extension over continental ones, especially if these vary in altitude; and considerable lapse of time. Rare species are shown to be in process of extinction. The divergence of character in domestic breeds, largely due to the fact that "fanciers do not, and will not, admire a medium standard, but like extremes," applies throughout nature from the circumstance that the more diversified the descendants from any one species become in structure, constitution and habits, by so much will they be better enabled to seize on many and widely diversified places in nature, and so to increase in numbers. A carnivorous animal which has reached the maximum numbers its territory can support, cannot succeed in increasing unless its varying descendants seize places hitherto occupied by other animals. This must hold equally true of all species, and is separately demonstrated for plants. The greatest amount of life can be supported by help of proportionally great diversification of structure; hence, in small areas where competition is severe, the inhabitants are extremely varied.

Sexual Selection.—Not merely do individuals struggle for existence, but the males struggle for the females, and the most vigorous tend to leave most progeny. Several weapons, offensive and defensive, like the cock's spurs, the stag's horns, or the lion's mane, are used in this struggle, and the most useful variations are those which are transmitted. Just as man can in a short time give beauty to his domestic birds, so there is no reason to doubt that female birds, in thousands of generations by selecting, as they are observed to do, the most melodious or beautiful males, might produce a marked result, and many sexual differences are thus explained.

Laws of Variation.—The same laws appear to have acted in producing the lesser differences between varieties of the same species, and the greater differences between species of the same genus. Specific characters are more variable than generic, and varietal than either. Rudimentary organs and secondary sexual characters are variable. Zebra-like stripes on horses, or woodpigeon's markings on fantails, tumblers, etc., may be explained as reversions toward their ancient progenitors.

Geological Succession of Organic Beings.—The most ancient forms differ widely from those now living, yet frequently present characters intermediate between groups now widely divergent, and resemble the embryos of the more recent and more highly specialized animals belonging to the same classes. These, and the important law of the succession of the same types within the same areas during the later geological periods, and most notably between the Tertiary Period and the present time, cease to be mysterious, and become at once thoroughly intelligible on the principle of inheritance, and on that alone. Darwin's belief that the distinctness of birds from all other vertebrates was to be accounted for by the extinction of a long line of progenitors connecting them with reptiles, was in 1859 a mere assumption; but in 1862 the long-tailed and palpably reptilian bird Archæopteryx was discovered, while in 1875 the researches of Marsh brought to light certain cretaceous birds, one with teeth set in a groove, the other with teeth in sockets, and with bi-concave vertebræ. Besides these reptilian birds, bird-like reptiles have similarly been forthcoming, and the hypothesis of Darwin is thus admirably verified.

Geographical Distribution.—Neither the similarity nor the dissimilarity of the inhabitants of various regions, whether of land or of sea, can be accounted for by identity or differences of climate, or other physical conditions; but both are related in the most striking degree to the absence or presence of barriers to migration between those regions.

Morphological Arguments.—The physiological and distributional lines of argument furnished by morphology are mainly four, and are derived from (a) Classification, (b) Homologies, (c) Embryology, (d) Rudimentary Organs. The great fact of classification is that organic beings, throughout all time, are arranged in groups subordinated under other groups, individuals under varieties, and these again under species; species under genera; genera under sub-families, families, and orders; and all under a few grand classes. The nature of all these relationships established by naturalists receives a simple and natural explanation on the view of the common descent of allied forms with modification through variation and natural selection, no other explanation ever having been attempted. The element of descent is already used in linking all the sexes, ages, forms, and varieties of the same species, widely though these may differ from each other in structure.

The members of the same class, independently of their habits of life, resemble one another in their general plan of organization. Thus the hand of man, the digging-paw of the mole, the leg of the horse, the paddle of the porpoise, and the wing of the bat, are all constructed on the same pattern, bone corresponding to bone. This conformity to type is "powerfully suggestive of true relationship, of inheritance from a common ancestor"; and admits of a simple explanation in terms of the evolutionary theory, thus strengthening that theory.

Serial Homology is that unity of type which is found on comparing the different parts and organs in the same individual. The complex and varied jaws and legs of a lobster, or the different leaves, sepals, petals, stamens, and pistils of a flower, are all found to be modifications of a simple limb and a simple leaf-organ respectively. Not only are such metamorphoses apparent on comparison, but they can be actually observed during the development of each individual. So closely do the embryos of the most distinct species belonging to the same class resemble each

other, that even Von Baer was unable to decide whether two unlabelled specimens were lizards, birds, or mammals. The process of development goes from the general to the special; thus there is generally an advance in organization. In peculiar conditions degeneration may occur. All these facts are explained on the principle of successive slight variations not necessarily or generally supervening very early in life, and inherited at a corresponding period; hence it is in the highest degree probable that most embryonic stages show us more or less completely the progenitor of the group in its adult state; and embryology thus rises greatly in interest. Darwin points out that the theory of evolution by natural selection is no more inimical to religion than is that of gravitation, to which the same objection was raised.

JOHN FISKE.

Darwinian Tubercle, a small raised portion, or tubercle, that may be found on the pinna of the ear. It is said to be present in a number of the primates and by many scientists has been regarded as an evidence of degeneracy in mankind. Different forms of Darwinian tubercles are described by anthropologists, but they have no real special significance.

Dasent, dā'sĕnt, Sir George Webbe, English philologist and novelist: b. St. Vincent, West Indies, 1820; d. near Ascot, Berkshire, 11 June 1896. He was for a while one of the editors of the London *Times,* and was one of the civil service commissioners. He was eminent as a scholar in the Norse languages, particularly Icelandic, and translated the 'Younger Edda,' besides many other ancient stories and legends of Iceland, and wrote 'The Norseman in Iceland' (1858); 'The Story of Burnt Njal' (1861). Among his original stories are: 'Annals of an Eventful Life'; 'Three to One'; 'Half a Life.'

Dash, Countess, pseudonym of **Gabrielle Anne Cisterne de Courtiras,** VICOMTESSE DE SAINT-MARS. French novelist: b. Poitiers, 2 Aug. 1804; d. 11 Sept. 1872. She was a very prolific writer, producing often five or six stories in the course of a year. Life in high society is her theme, and especially wayward love in high society, as the titles of most of her novels indicate: 'Bussy-Rabutin's Amours'; 'Gallantries of the Court of Louis XV.'; 'Last Amours of Mme. du Barry'; 'Adventures of a Young Married Woman.'

Dashkoff, däsh'kŏf, **Princess Ekat'erina Romanov'na,** Russian scholar: b. St. Petersburg 22 March 1743; d. 16 Jan. 1810. She married Prince Dashkoff when only 15 years old, but was left a widow three years after. She was an intimate friend of the Empress Catharine II., and one of the heads of the conspiracy formed against Peter III., the success of which secured the throne to Catharine. Soon afterward quarreling with Catharine, she obtained permission to travel, and visited Germany, England, France, and Italy, making the acquaintance of many eminent men. On her return the princess was appointed director of the Academy of Arts and Sciences; and in 1783, president of the Russian Academy, established at her own suggestion in imitation of the French Académie. Besides writing several comedies and occasional papers, the Princess Dashkoff was mainly instrumental in inducing the Russian Academy to draw up a dictionary of the Russian language, and herself executed part of the work. See her very interesting autobiography (trans. 1840).

Daskam, Josephine Dodge, American writer: b. Stamford, Conn., 17 Feb. 1876. She was educated at Smith College and in addition to frequent contributions to magazines has published in book form 'Smith College Stories' (1900); 'A Sister's Vocation and Other Girls' Stories' (1900); 'The Imp and the Angel' (1901); 'The Madness of Philip' (1900); 'The Best Nonsense Verses' (edited; 1902).

Dass, däss, **Peder,** pā'dĕr, or **Petter,** Norwegian poet: b. Nord-Herö, parish of Alstahoog, Nordland, 1647; d. Aug. 1708. He studied at the University of Copenhagen, became pastor of the parish of Alstahoog in 1689 and grew rich from commerce and fisheries, buying for himself the royal domain of Vefsen. He became the most popular poet in Norway, leaving 127 poems of which only 24 are now extant, his masterpiece being a descriptive poem: 'The Trumpet of the Nordland,' written in the Dano-Norwegian dialect.

Dassy, or **Dassie,** the name given in South Africa to the rock-rabbit (*Procavia capensis*), the Dutch name for which is klip-das. The name dassy is merely a diminutive in local use, especially in Cape Colony. See HYRAX.

Dasyproc'ta, a genus of agoutis (*Dasyproctidæ*), a familiar group of rodent mammals inhabiting Central and South America, and some of the West India Islands. The agoutis are a little larger than the common rabbit, have a rabbit-like head, but with short ears, hooped, pig-like claws, and are swift-footed. They live in the woodland, and search for food by night in the open country.

Dasyure, dăs'ĭ-ūr, a marsupial native to Australasia; and belonging to the family *Dasyuridæ.* It is the survivor of the fossil forms found in Tertiary strata in South America, and elsewhere; and is allied to the opossum. The hind and fore legs are about equal in length, and the toes are furnished with claws; the long hairy tails are not prehensile. The dasyures are chiefly strong, fierce creatures of cat-like propensities, whose depredations have caused heavy losses in farming and ranching districts, so that the colonists of Australasia, more especially those of Tasmania, have nearly exterminated them, by persistent effort. Among them we find the Tasmanian zebra-wolf (*Thylacinus cynocephalus*), a wolf-like creature, rather smaller than the common wolf, with short fur, a long smooth tail, and rounded ears. Its color is brownish, and it is barred at the hinder portion of the back and the roots of the tail with dark stripes. It prowls about by night, making raids upon unguarded sheep-folds. By day, it skulks in caverns among the rocks. Another foe to the flocks is the Tasmanian Devil (*Sarcophilus ursinus*). This creature, in size like a badger, in appearance like a bear, is ponderous, powerful, dark-colored, and covered with a coat of long fur. It sleeps by day; and, like the zebra-wolf, seeks its prey by night. It is very strong and ferocious; but despite this, has been successfully put down by the colonists; in fact, it has been nearly exterminated. Another species is the Australian "native cat," a spotted creature, almost as large as a house-cat. It belongs to the genus *Dasyurus,*

in which are also several other and smaller species. Perhaps the most interesting of the small Dasyures, is the banded ant-eater (*Myrmecobius fasciatus*) found in western and southern Australia. It is a reddish brown in color, banded posteriorly with white; is about the size of a squirrel, and has a long protrusile tongue for gathering its insect food. It is considered as a practically unmodified representative of certain extinct marsupials found in the Secondary rocks of Europe. It lives in sandy plains, where it finds food in plenty. Other species, small as rats and mice, and living chiefly on insects, birds, eggs, etc., are found in the genus *Phascogale*, and allied genera; and the jerboa-like creature (*Antechinomys laniger*) constitutes another genus, of a single species. It is native to Queensland and New South Wales, but is very rare. See MARSUPIALS.

Data'ria, an office of the Curia Romana (q.v.) from which are sent forth certain classes of papal documents, as dispensations and appointments to Church benefices. The word had its origin in the formula of subscription of letters, for example, *Datæ Kalendis Martiis*, given (or sent) 1 March; that is the date of the document; and it is the duty of the Dataria to guard against possible errors of either dating or addressing documents, or in the tenor of the documents themselves.

Date, any given, fixed, or settled time; the time when any event happened; period; era; age; epoch; as, the date of the Christian era, the date of a historical occurrence, etc. Also, that addition to a writing which specifies the year, month, and day when it was given or executed; the number which marks the time when any writing, instrument, coin, picture, etc., was executed. Under the Romans the word *datum* was used to signify the day on which the bearers of imperial despatches received them at Rome, or delivered them in the provinces. It was also employed in documents in the time of the French Merovingian kings. See EPOCH; CHRONOLOGY.

Date Line. See INTERNATIONAL DATE LINE.

Date, or **Date Palm** (*Phœnix dactylifera*) a tall tree of the natural order *Palmaceæ*. It is most notable for its fruit, which is an important part of the daily food of the natives of western Asia and northern Africa, where the tree is indigenous and from whence large quantities of dried dates (the fruits), are exported to other countries. The tree is also cultivated in some other warm countries, including China, Italy, France, Spain and parts of the United States, — Florida, New Mexico, Arizona and California, in the last three of which a promising industry seems to be becoming started. The tree, which attains a height of 100 feet, and bears fruit for one or two centuries, is, like other palms, useful in many ways; nearly all its parts are used for something. Date seeds are roasted and used as a substitute for coffee, or ground and pressed for oil and the pomace used for stock food. The leaves are used for matting, baskets, thatch, etc.; the terminal bud as a vegetable; the wood for fence making and other purposes where great strain is not expected; the fibre of the bark for making rope; but the fruit, which contains proteids, gum, and pectin, and is particularly rich in sugar, is the most important part. It is one of the principal sources of wealth in the countries where the date is indigenous. It is believed that the leaves of this palm are the ones referred to in biblical writings, and at the present time the leaves of this palm are largely used upon Palm Sunday among Christians living where the trees abound. The leaves were also symbolical of victory, beauty, etc., among the ancient Greeks and Jews.

Since the male and female flowers are borne on separate trees, enough specimens of staminate flowering trees must be planted to fertilize the blossoms on the others which alone produce fruit. Since the plants obtained from seeds are of unknown sex until they flower, and since the proportion of inferior seedlings to seedlings which bear superior fruit is very large, the date is propagated by means of suckers, since these retain the characteristics of the parent. The young plants are set in sunny situations, in almost any kind of soil where water is within reach of the roots or can be supplied by irrigation. The sandy, alkaline soils of deserts seem more satisfactory than the richer soils necessary for the growth of general crops. The trees are very difficult to make grow after transplanting, because they demand special attention especially as to watering. A loss of 50 per cent is not uncommon even with the best of attention. The surviving trees should commence to bear when about eight years old. The fruit is borne in clusters which hang from the thick crown of large pinnate leaves. Individual trees produce from 300 to 500 pounds or more of fruit in a season. Consult: Bulletin No. 29, Arizona Experiment Station, Phœnix, Arizona.

Date-plum, a common name for plants of the genus *Diospyros*, of the ebony family (*Ebenaceæ*). The genus has about 160 species, and is most abundantly represented in Asia. In America two species are known, the most common being the persimmon (q.v.), *D. virginiana*. The common date-plum or pishamin, also called the European lotus and the date of Trebizond (*D. lotus*), is a tree 18 to 30 feet high, with oblong shining leaves and small reddish-white flowers, a native of the coasts of the Caspian Sea, northern Africa, etc., but cultivated and naturalized in the south of England. Its fruit is of the size of a cherry, and in favorable climates larger, yellow, sweet, and astringent. It is eaten when overripe, like the medlar, or is used for preserves. This fruit has been supposed by some to be the *lotus* (q.v.) of the Lotophagi. *D. mabola* is cultivated as a fruit-tree in Mauritius. *D. kaki*, sometimes called the keg-fig, is a native of Japan, and occasionally is kept in greenhouses in France and England. The sweetmeat called *figues-caques* is made from this fruit in France. The fruit of some other species is also edible, as, for example, that of *D. decandra* of Cochin-China. See EBONY; PERSIMMON.

Date-shell, or **Date Fish**, a bivalve shell or its inhabitant of the genus *Pholas*, a kind of mollusk. They bore holes in clay, peat, and soft rocks, and in some instances in hard stone, as in columns from the Temple of Serapis, which were brought from Africa to Italy. Species of the date-shell are found in the Mediterranean and its arms, on the coast of California and in a few places on the west shore of the Pacific. Some are edible.

Datha, American cacique. He governed the province of Chicora, on the east coast of Florida, visited by Lucas Vazquez de Ayallon, auditor of San Domingo, in 1520. He was a giant, and Helps, in the 'Spanish Conquests in America,' says: "His gigantic stature had been artificially produced, for it is said that the Indians of those parts had a method of elongating the bones of children when very young, a practice which they applied to those of royal race."

Datholite. See DATOLITE.

Datia. See DUTTEEAH.

Datiscin, dā-tĭs'sĭn, a substance yielded by the bastard hemp, *Datisca cannabina,* a common plant in gardens, indigenous to the Punjab, and largely used in the south of Europe and in Asia for dyeing yellow. It can be extracted from the leaves and roots by exhausting with alcohol, concentrating, adding water, filtering from a resin, crystallizing and purifying the glucoside so obtained. When pure it forms colorless silky needles, which are readily soluble in alcohol, sparingly in ether and in water, and have a bitter taste. It has feeble acid properties, and gives yellow compounds with lead and tin which can be used as dyes. When boiled with dilute acids it is resolved into sugar and *datiscetin,* which crystallizes readily. It is soluble in alcohol and in ether, almost insoluble in water. It also gives a fine yellow color when combined with lead.

Dative, in grammar, one of the cases of nouns and pronouns, the usual function of which is to mark the recipient of something given. In English there is no distinctive form for this case; yet when we say, for instance, "give me or him that," "I gave the man a crown," *me, him,* and *man* are really in the dative. In Latin, Greek, Sanskrit, German, etc., there are distinct forms for this case. See CASE.

Dattiya. See DUTTEEAH.

Dat'olite, dăt'o-līt, or **Dath'olite,** a basic silicate of boron and calcium, having the formula $H_2O.2CaO.B_2O_3.2SiO_2$, and crystallizing in the monoclinic system. Its crystals are glassy in appearance, white in color (often with a greenish tinge), and transparent or translucent. Before the blow-pipe it melts with intumescence, and gives a green color to the flame. Its hardness is from 5 to 5.5, and its specific gravity is about 3. In the United States it occurs in Connecticut, New Jersey, and the Lake Superior district. It is also found in the Salisbury Crags near Edinburgh, as well as in Norway, Sweden, and other parts of the European continent. The name is from two Greek words that refer to the tendency that one of its massive varieties exhibits, to divide into granular portions. The crystals when polished are used as ornaments.

Datura, dą tū'ra, a genus of plants of the potato family (*Solanaceæ*). It contains about 125 species, widely distributed. The genus is represented in the United States by coarse weeds naturalized from tropical America. Jamestown or Jimson weed (*D. stramonium*) is said to have received its name from a poisoning that occurred from its use by the settlers of Jamestown, Va. It is also called thorn-apple. It is found in waste places from the eastern seaboard west to Minnesota and Texas. The purple thorn-apple or purple stramonium (*D. tatula*) is found throughout the same region as the Jimson weed, but the entire-leaved thorn-apple (*D. metel*) does not grow far from the Atlantic coast. An extract from these plants is used in medicine. When taken internally it is a powerful narcotic; medically it is used in mania, convulsions, epilepsy, tic-doulereux, etc. When smoked it palliates the symptoms in asthma. *D. tatula* and *metel* are similarly used. The seeds of these two latter species are said to have been used to produce the frenzied ravings of the priests in the Delphic and some other temples. The Peruvians use for the same purpose *D. sanguinea,* manufacturing from it also an intoxicating beverage.

Datu'rine, a poisonous alkaloid found in the thorn-apple (*Datura stramonium*), and now known to be identical with atropine (q.v.).

Daub, dowp, **Karl,** German Protestant theologian: b. Cassel, Germany, 20 March 1765; d. Heidelberg, Baden, 22 Nov. 1836. Professor of theology at Heidelberg from 1795. His works include 'Lehrbuch der Katechetik' (1801); 'Theologumena' (1806); 'Die Dogmatische Theologie jetziger Zeit' (1833), etc.

Dauban, Jules Joseph, zhül zhō'zĕf dō-bäń, French painter: b. Paris 31 May 1822. He was a pupil of Auguste Debay. His taste led him to historical and religious subjects, and his compositions, severe in design and of a great simplicity in the accessories, are somewhat cold and sober in color. He became director of the museum and the School of Fine Arts in Angers in 1849, received a medal in 1864 and the decoration of the Legion of Honor in 1868. Among his works are: 'Louis XI. presenting Guillaume de Cerizay as Mayor of Anjou' (1861); 'Reception of a Stranger by the Trappists' (1864), Luxembourg Museum; 'Trappists Exchanging the Kiss of Peace before Communion' (1865), Museum of Angers; 'Madame Roland Going to the Revolutionary Tribunal' (1869); 'Fra Angelico da Fiesole' (1873); and several portraits and decorative paintings.

Daubenton, Louis Jean Marie, loo-ē zhŏń mä-rē do-bäń-tôń, French naturalist and physician: b. Montbard Côte-d'-Or, France, 29 May 1716; d. Paris 31 Dec. 1799. He became celebrated for his participation in the Natural History of Quadrupeds by his friend Buffon; the anatomical part of which was prepared by Daubenton with great accuracy, clearness, and sagacity. In 1744 he was chosen member of the Academy of Sciences, and enriched its publications by a number of anatomical discoveries, and also by researches concerning the species of animals and their varieties, the improvement of wool, and the treatment of the diseases of animals. He threw much light upon mineralogy, botany, and agriculture, and proposed a new method for the classification of minerals. He was the author of numerous works of general utility: for example, 'Instruction pour les Bergers' (1782); 'Mémoire sur les Indigestions,' and many others. He became professor of natural history in the College of Medicine in 1778, and about seven years after professor of mineralogy in the Museum of Natural History. Dur-

ing the Reign of Terror, when every one was required to give some evidence of patriotic spirit, he was represented to his section as employed in introducing the Spanish sheep into France.

Daubeny, dâ'bē-nĭ or dōb'nĭ, **Charles Giles Bridle,** English scientist: b. Stratton, Gloucestershire, 11 Feb. 1795; d. Oxford 12 Dec. 1867. He was educated at Winchester College and Magdalen College, Oxford, and practised for some years as a physician in Oxford. In 1818 he visited Auvergne, and in 1837 made a scientific visit to the United States. In 1822 he was admitted a Fellow of the Royal Society, and from 1822 to 1855 was professor of chemistry in the University of Oxford. In 1834 he became professor of botany, and in 1840 of rural economy in the same university. He held the last appointment till his death. His principal works are: 'A Description of Active and Extinct Volcanoes' (1826); 'An Introduction to the Atomic Theory' (1831; with a supplement, 1840); 'Report to the British Association on Mineral and Thermal Waters' (1836); 'Lectures on Agriculture' (1841); 'Sexuality of Plants' (1860); 'Climate' (1863).

D'Aubigné, Jean Henri Merle, zhŏñ ŏñ-rē mĕrl dō-bēn-yā, Swiss ecclesiastical historian: b. Eaux-Vives, near Geneva, Switzerland, 16 Aug. 1794; d. Geneva 21 Oct. 1872. In 1818 he became pastor of the French Protestant Church in Hamburg. In 1823 he was appointed court-preacher at Brussels; but after the revolution of 1830 returned to Geneva, and filled the chair of Church history in its theological seminary until his death. The work which has given him a widespread reputation is his 'Histoire de la Réformation au Seizième Siècle' (1835–53); it has been translated into most European tongues, and has attracted more notice abroad than at home; it is written with a devout, fervid sympathy that is often eloquent, although the narrative is too graphic to be everywhere exact. Its popularity has been very great. Among his other writings are: 'Germany, England, and Scotland' (1848); a vindication of Cromwell (1848); 'Trois Siècles de Lutte en Ecosse' (1849); and 'Histoire de la Réformation en Europe au Temps de Calvin' (1862–78).

D'Aubigné, Merle. See D'Aubigné, Jean-Henri Merle.

D'Aubigné, Théodore Agrippa. See Aubigne, D'.

Daubigny, Charles François, shärl fräñ-swä dō-bēn-yē, French landscape painter and etcher: b. Paris 15 Feb. 1817; d. there 19 Feb. 1878. He studied under his father, who was a miniature painter, Paul Delaroche, and others; and from 1838 exhibited in the Salon, though his full recognition came only after the artist had reached his 50th year. He devoted himself to close and sympathetic study from nature, working much on the Seine in a house-boat, and developed a style of landscape art marked by singularly unaffected fidelity and originality. In 1853 he gained a first-class medal with his 'Pool of Gylien.' In 1857 he produced his 'Springtime'; in 1861 'The Banks of the Oise'; in 1872 'Windmills at Dordrecht'; and in 1877 his large and very impressive 'Rising Moon.' His 'Sluice in the Valley of Optevoz' (1855), and his 'Vintage' (1863), are in the Luxembourg Gallery. His is also known as a book-illustrator and as a vigorous etcher, having produced over 100 plates, some reproductions, others direct from nature, marked by great frankness of method and free painter-like quality. See Henriet, 'Daubigny et son œuvre' (1878); Van Dyke, 'Modern French Masters' (1896); Stranahan, 'History of French Art' (1900).

D'Aubusson, Pierre. See Aubusson, Pierre d'.

Daucus, dâ'kŭs, the typical genus of the *Umbelliferæ* or carrot family. The genus has about 25 species, two of them growing wild in America. Wild carrot, crow's-nest, or Queen Anne's lace (*D. carota*), is generally a pernicious and abundant weed throughout the Union. It is a native of Asia, naturalized from Europe. It is the original of the cultivated carrot. See Carrot.

Daudet, Alphonse, âl fôñs dō-dā, French novelist: b. Nîmes 13 May 1840; d. Paris 16 Dec. 1897. He was educated at the Lyons Lycée, and for two years after leaving it supported himself as an usher at Alais. Going to Paris in 1857 he took to writing verse, his first volume being 'Les Amoureuses' (1858), which met with some success. This was followed by other poems, including 'La Double Conversion' (1859), and at this time he also contributed to the 'Figaro,' and other journals. About 1862 he began writing for the stage, and during the succeeding 10 years or so several dramas by him were represented, but with only moderate success. These included: 'La Dernière Idole' (1862); 'L'Œillet Blanc' (1865), and 'Le Frère Aîné (1868). Greater public favor was accorded to his 'Lettres de Mon Moulin,' which appeared in 1866 in a Parisian journal. In 1872 he produced his celebrated 'Les Aventures Prodigieuses de Tartarin de Tarascon,' an amusing satire on the boastfulness so characteristic of the south of France. From this time he published numerous works, some of the best being: 'Fromont Jeune et Risler Aîné' (1874); 'Jack' (1876); 'Le Nabab' (1877); 'Les Rois en Exil' (1879); 'Numa Roumestan' (1881); L'Evangéliste' (1883); 'Sapho' (1884); 'Tartarin sur les Alpes' (1885), a sequel to 'Les Aventures Prodigieuses'; 'Trente Ans à Paris' (autobiographical), (1887); 'Souvenirs d'un Homme de Lettres' (1889); 'Port Tarascon, dernières Aventures d'Illustre Tartarin' (1890); 'Rose et Ninette' (1892); 'La Menteuse' (1893); 'Entre les Frises et la Rampe' (1894); 'La Petite Paroisse' (1895); 'Contes d'Hiver' (1896); 'L'Enterrement d'une Etoile' (1896); 'Les Mères' (1896); 'Le Trésor d'Arlatan' (1897); 'La Fédor' (1897); and 'Soutien de Famille' (1897). M. Daudet has often been compared with Dickens in his mastery of pathos and humor. Some of his principal works rely mainly on his great powers of caricature for their success. His chief works have been translated into English and in this dress have been very popular. See Brunetière, 'Le roman naturaliste' (1896).

Daudet, Ernest Louis Marie, èr-nā loo-ē mä-rē, French novelist: b. Nîmes 31 May 1837. He is a brother of Alphonse Daudet (q.v.). His most notable novels are: 'The Venus of Gordes'; 'The Bloom of Sin'; 'Martha.' He

is author of an autobiographical sketch, 'My Brother and Myself' (1882); and has written some historical sketches, as a 'History of the Royalist Conspiracies in the South During the Revolution' (1881); 'History of the Emigration' (1886); 'Les Bourbons et la Russie pendant la Révolution Française' (1888).

Daughter of the Confederacy. See DAVIS, VARINA ANNE JEFFERSON.

Daughters of the American Revolution, a society composed of women who are descendants of ancestors, any of whom "with unfailing loyalty rendered material aid to the cause of independence as a recognized patriot, as soldier or sailor, or as a civil officer in one of the several colonies or States." It was organized in Washington, D. C., 11 Oct. 1890.

Daughters of the Confederacy, United, an association of the widows, wives, mothers, sisters, and lineal female descendants of men who served honorably in the army and navy of the Southern States, or who gave personal services to the Confederate cause. It was organized at Nashville, Tenn., 10 Sept. 1894.

Daughters of the Holland Dames, a colonial society of women, the official title being "The Daughters of Holland Dames, Descendants of the Ancient and Honorable Families of New York," was incorporated for the purpose of erecting a memorial to commemorate the early Dutch period of our colonial history, and to preserve and collect historical documents relating to the same. The headquarters are in New York. This society is not connected with the Holland Dames.

Daughters of the King, a Protestant Episcopal order of women (not to be confounded with the King's Daughters), organized in 1885. The aim of the society is to bring young women within the influence of the Church and to co-operate with the rectors of parishes to that end. President, Mrs. E. A. Bradley. The office of the council is in New York.

Daughters of the Revolution, a patriotic society of women in the United States, organized in 1891. Eligibility to membership is restricted to "women who are lineal descendants of an ancestor who was a military or naval or marine officer, soldier, sailor, or marine, in actual service under the authority of any of the 13 Colonies or States, or of the Continental Congress, and remained always loyal to such authority, or descendants of one who signed the Declaration of Independence, or of one who as a member of the Continental Congress or of the Congress of any of the Colonies or States, or as an official appointed by or under the authority of any such representative bodies, actually assisted in the establishment of American independence by service rendered during the War of the Revolution, becoming thereby liable to conviction of treason against the government of Great Britain, but remaining always loyal to the authority of the Colonies or States.' There are numerous subordinate State organizations.

Daughters of 1812. See UNITED STATES — DAUGHTERS OF 1812, NATIONAL SOCIETY OF.

Daulatabad, dow-lät-ä-bäd' ("fortunate city"), India, a town and fort in the Deccan, within the Nizam's dominions, 28 miles northwest of Hyderabad. The fortress consists of a conical rock, 600 feet high, with a wide ditch and an outer wall nearly three miles in circumference. The place surrendered to the Mohammedans in 1294, and Shah Muhammad Tughlak (1324–51) thrice attempted to remove the seat of government hither from Delhi. The fortress has not been garrisoned now for many years, and the town has greatly decayed. Pop. 1,243.

D'Aulnoy, dōl'nwä, **Marie Catharine Jumelle de Berneville,** zhü-mĕl dė bär-nė-vēl, COUNTESS, French writer: b. about 1650; d. 1705. She wrote many romances, long consigned to safe oblivion, but her fame rests securely on her 'Fairy Tales,' written in a simple, bright, and charming style, not altogether unworthy of Perrault. 'The White Cat,' the 'Yellow Dwarf,' 'Finette Cendron,' and 'Le Mouton' have for two centuries been naturalized in the nurseries of Europe, and are still familiar figures in pantomime. Her altogether delightful 'Travels in Spain' was reissued in New York in 1898.

Daumer, Georg Friedrich, gā'ōrg frēd-rĭH dow'mėr, German writer: b. Nuremberg 5 March 1800; d. Würzburg 14 Dec. 1875. He underwent some remarkable revolutions of thought concerning religion; in his student days leaned strongly to Pietism; next was the declared foe of the Christian religion; and about 1859 embraced Catholicism and became one of its foremost champions. He wrote among many other philosophical tractates: 'Hints Toward a System of Speculative Philosophy' (1831); to his second period belongs: 'The Fire and Moloch Worship of the Hebrews' (1842); to his third: 'My Conversion' (1859). Of his poetical works, the 'Flowers of Song from Hafiz' may be named — a very beautiful transcription of the Oriental poet, with free variations in the very spirit of Hafiz himself. He wrote also 'Beautiful Souls: a Little Wreath of Legends and Poems' (1862); 'Legends and Poems of St. Mary.'

Daumier, Honoré, ō-nō-rā dō-mē-ā, French caricaturist: b. Marseilles 26 Feb. 1808; d. Valmondois 10 Feb. 1879. Fashion, tittle-tattle, scandal, politics, blemishes of figure, and oddities of character in turn inspired his inexhaustible genius for mockery. Few among his illustrious contemporaries escaped his pencil, and his caricatures had always some strikingly truthful feature about them. He made his début in the 'Charivari,' in a series of sketches from 'Robert Macaire'; and the revolution of 1848 suggested two of his most remarkable series, 'Parliamentary Idylls' and 'The Representatives Represented.' In his old age Daumier became blind, and was befriended by Corot, the landscape painter. See Alexandre, 'Honoré Daumier, l'homme et son œuvre' (1890).

Daun, Leopold Joseph Maria, lā'ō-pold yō'sĕf mä-rē'ä down, COUNT VON, Austrian general: b. Vienna 25 Sept. 1705; d. 5 Feb. 1766. He served in the Turkish war in 1710; as major-general in Italy in 1734; and distinguished himself at the battle of Krozka in 1737, and the capture of Dingelfingen in 1740. In 1748, after serving against the French in the Netherlands, he was made Knight of the Golden Fleece. He

defeated Frederick the Great at Kolin in 1757, and again at Hochkirch in 1758.

Dauphin, dâ'fĭn, Fr. dō-făn, the title of the eldest son of the king of France. Dauphin was originally a title held by several of the feudal lords of France, and is believed to have originated from the dolphins (Fr. *dauphin*) worn on their helmets or used as a family crest. In 1349 Humbert II., dauphin of Viennois, being childless, transferred his estate, called the Dauphiny (*le Dauphiné*), in the south of France, to Philip of Valois, on condition that the eldest son of the king of France should in future be styled the dauphin, and govern this territory. The dauphin, however, retained only the title, the estates having been united with the crown lands. On the death of the dauphin his eldest son inherited this title; if he had no son his eldest brother succeeded him. If the king had no son, as was the case in the reign of Louis XVIII., the title of dauphin was not bestowed on any one; for it was never given to the next prince of the blood and presumptive heir, even if he were the king's brother. The wife of the dauphin was called dauphiness (*dauphine*). The *Delphin* classics were editions made for the use of the dauphin (*in usum delphini*).

Dauphiné, dō-fēn-ā, one of the ancient provinces of France. It was divided into Upper and Lower Dauphiné. It forms the departments of the Isère, the Hautes Alpes, and part of that of the Drôme. The capital of the whole was Grenoble. The province constituted a sort of triangle, bounded north by Bresse and Savoie, east by Piedmont, south by Provence, and west by the Rhone.

Daurat, Jean, zhŏn dō-rä, French scholar: b. about 1510; d. 1588. He became president of the College Coqueret, where he superintended the studies of Ronsard, Du Bellay, Baif, and Belleau. These poets he carefully trained for the task of reforming the vernacular, and ennobling French literature by the imitation of Greek and Latin models. He wrote nothing of importance in French, but devoted himself to guiding and stimulating the other members of the Pléiade, in whose works his learning and enthusiasm bore rich and enduring fruit.

Dauw, dâ, or **Peechi** (*Equus burchelli*), an animal closely resembling the zebra, which inhabits the plains of southern Africa, particularly to the north of the Orange River. It is about the size of an ass, but more delicately formed. Its general color is a pale brown, with grayish-white on the abdomen and inner parts of the limbs. Its head, neck, and body, and the upper parts of its limbs are striped like the zebra, but the stripes are not so dark in color. It migrates periodically in search of food, and in times of scarcity visits the cultivated lands and makes havoc of the crops. It has been tamed to some extent, but its temper cannot be relied on. The Dutch colonists call it Bonte-quagga. It is known also as Burchell's zebra. See ZEBRA.

Davao, dä-vä'ō, Philippines, a province in the southeastern part of the island of Mindanao; area 8,976 square miles; with dependent islands 9,171 square miles. Most of the communication between towns and villages is by sea, as almost all are on the coast; there are a few roads, and the United States troops have done much to improve them. Hemp, coffee, tobacco, rice, and corn are cultivated; the cinnamon tree, the betel nut, cloves, and nutmeg grow without cultivation; large numbers of horses, cattle, and hogs are raised. There are indications of deposits of coal and some gold, and there are many valuable forests. Davao was occupied by United States troops in December 1899, and was given civil government in 1903.

Dav'enant, Sir William, English poet and dramatist: b. Oxford February 1606; d. London 7 April 1668. He was employed in preparing several masques for the entertainment of the court; and on the death of Ben Jonson in 1637, succeeded to the vacant laurel. On hostilities breaking out between Charles I. and the Parliament, Davenant displayed his attachment to the royal cause. At the siege of Gloucester in 1643, he was knighted by the king; and on the decline of the royal cause retired to France, where he became a Roman Catholic, and began the composition of his principal work, a heroic poem, entitled 'Gondibert.' An attempt which he afterward made to lead a French colony to Virginia had nearly proved fatal to him. The ship in which he had sailed from Normandy was captured by a cruiser in the service of the English Parliament, and carried into the Isle of Wight, where Davenant was imprisoned in Cowes Castle. In this forlorn captivity, from which he had but little hope of escaping alive, he composed the third book of 'Gondibert.' In October 1650 he was removed to London for trial before the high commission court. His life is said to have been preserved by the interposition of Milton. There is a corresponding tradition, that Davenant repaid the good offices of Milton by protecting the republican poet after the Restoration. On the return of Charles II. to England the stage was re-established with renewed splendor, and Davenant became patentee of a theatre in Lincoln's Inn Fields. He continued to employ his pen and his talents as a theatrical writer and manager till his death. He was buried in Westminster Abbey. His works consist of dramas, masques, addresses, and the epic 'Gondibert,' which was never finished; but he is remembered chiefly by the reconstruction of Shakespeare's 'Tempest,' in which he was engaged along with Dryden, a work which long held the stage in place of the original, although unequivocally condemned by modern criticism as a vulgar and degraded version of a drama which stood in need of no such emendation.

Dav'enport, Charles Benedict, American zoologist: b. Stamford, Conn., 1 June 1866. He was graduated from Harvard in 1889; is a director of the biological laboratory of the Brooklyn Institute of Arts and Sciences, and in 1899 was appointed professor of zoology at the University of Chicago. He has written: 'Experimental Morphology' (1897–9); 'Statistical Methods in Biological Variation' (1899); and 'Introduction to Zoology' (with G. C. Davenport, 1901).

Davenport, Cyril James, English librarian: b. Stirling, Scotland, 5 June 1848. He has been a librarian in the British Museum since 1868 and has published: 'The English Regalia' (1897); 'Royal English Bookbindings' (1897); 'Cantor Lectures on Decorative Bookbindings'

(1898); 'English Embroidered Bookbindings' (1899); 'Cantor Lectures on Cameos' (1900); 'Life of T. Berthelet' (1900); 'Personal Jewelry' (1902).

Davenport, Edward Loomis, American actor: b. Boston 15 Nov. 1814; d. Canton, Pa., 1 Sept. 1877. His first appearance was made in 1836 at Providence, R. I., as Parson Will in 'A New Way to Pay Old Debts,' with Junius Brutus Booth as Sir Giles. In 1838 he played in Philadelphia. He soon became a leading performer in comedy, melodrama, and tragedy. Up to 1847 he appeared chiefly in Boston. In that year he went to England with Mrs. Mowatt, there playing Claude Melnotte in 'The Lady of Lyons,' with Mrs. Mowatt as the Pauline. For two seasons he supported W. C. Macready. In 1854 he returned to the United States, where he traveled extensively, playing especially Shakespearean parts and those in dramatizations of Dickens. As Brutus in 'Julius Cæsar' and Bill Sykes in 'Oliver Twist' he was equally successful. Among his other characters were Sir Giles Overreach and Hamlet. In 1859 he became manager of the Howard Athenæum, Boston, in 1869 of the Chestnut Street Theatre, Philadelphia. His versatility and finish were notable. Consult Edgett, 'E. L. Davenport' (1901; Dunlap Society Pub., new series, No. 14).

Davenport, Eugene, American agriculturist and educator: b. Woodland, Mich., 20 June 1856. He was professor of agriculture in the Michigan Agricultural College in 1889–91, and president of the agricultural college at São Paulo, Brazil, in 1891–2. In 1895–1901 he was professor of animal husbandry in the University of Illinois. In September 1901 he became dean of the College of Agriculture of that institution, director of the Agricultural Experiment Station, and professor of thremmatology. He has contributed to the agricultural press and the bulletins of the experiment stations of Illinois and Michigan.

Davenport, Fanny Lily Gypsy, American actress: b. London 10 April 1850; d. Duxbury, Mass., 26 Sept. 1898. Her first appearance on the stage was at the Howard Athenæum in Boston, then under the management of her father, E. L. Davenport (q.v.). She played during her career in the theatres of all the large cities in the United States. Her most noted roles were in 'La Tosca,' 'Giaconda,' 'Fedora,' and 'Cleopatra.' She was married in 1879 to Edwin H. Price, but was divorced and subsequently married Melbourne McDowell, an actor of leading roles in her company.

Davenport, Franklin, American legislator: b. Philadelphia, Pa.; d. Woodbury, N. J., about 1829. He studied law, and, having been admitted to the bar, practised at Woodbury, N. J. In the Revolution he was a captain of artillery in Newcomb's New Jersey brigade, and also stationed at Fort Mifflin. In 1794, at the time of the "Whiskey Insurrection," he marched with the troops to Pittsburg as colonel of the New Jersey line. He was appointed United States senator to fill a vacancy, serving in 1798–9, and was a representative in Congress in 1799–1801.

Davenport, Herbert Joseph, American educator and publicist: b. Wilmington, Vt., 10 Aug. 1861. He was educated at the University of South Dakota, and the Harvard Law School, and is now (1903) principal of the high school at Lincoln, Neb. He has published: 'Outlines of Economic Theory' (1896); 'Elementary Economic Theory' (1898); 'Principles of Grammar' (with Emerson, 1898).

Davenport, Henry Kallock, American naval officer: b. Savannah, Ga., 10 Dec. 1820; d. Franzensbad, Bohemia, 18 Aug. 1872. He entered the navy in 1838, and in 1844, as passed midshipman, became connected with the coast survey. In 1849–53 he was in the mail-steamship service, subsequently was on sea duty with various squadrons, and in 1856 participated in the capture of the Barrier forts, Canton River, China. During the Civil War he commanded the steamer Hetzel in 1861–4, being in 1862–4 senior officer in command of the sounds of North Carolina. Promoted captain in 1868, he was assigned to the command of the Congress of the European squadron in 1870.

Davenport, Homer Calvin, American artist and cartoonist: b. Silverton, Ore., 8 March 1867. Without schooling or art education, and after many vicissitudes as jockey, circus clown, and railroad stoker, he was employed by the San Francisco *Examiner* in 1892 and since then has been engaged upon the staff of the *American and Journal,* the *World,* and the *Evening Mail* of New York. He has also appeared as a lyceum lecturer. He has published: 'Davenport's Cartoons'; 'The Bell of Silverton, and Other Short Stories of Oregon'; 'The Dollar or the Man.'

Davenport, Ira, American politician: b. Hornellsville, N. Y., 28 June 1841; d. Bath, N.Y., 6 Oct. 1904. After graduating from Yale College he went into business and in 1877 was elected to the New York senate and re-elected in 1879. During both terms he served as chairman of the committee on commerce and navigation. He was elected comptroller of the State of New York in 1881, and after retiring from that office served two terms as member of Congress. He was the Republican candidate for governor of the State of New York in 1885, but was defeated by D. B. Hill, after which time he retired from politics.

Davenport, John, American Puritan clergyman: b. Coventry, England, 1597; d. Boston, Mass., 15 March 1670. Educated at Oxford, he became chaplain of Hilton Castle, near Durham, later was made minister of Saint Stephen's Church, London (1616–33), and there attained a considerable reputation as a preacher. His Puritanical principles and views ere long brought him into conflict with Archbishop Laud, and in 1633 he withdrew from the English Church, and removed to Holland, where he became colleague of the Rev. John Paget, pastor of the Puritan church at Amsterdam. In 1636, however, he returned to England, where he was very active in obtaining the charter of the Massachusetts colony. He arrived in Boston in June 1637, sat with the synod of Cambridge in August, and in March 1638 sailed with the band of colonists that founded New Haven (Quinnipiac). Here he was extremely influential in civil as well as ecclesiastical affairs. He was minister there for 30 years, and aided in establishing the system of civil polity, which began by the declaration that "all of them would be ordered by the rules which

the Scriptures held forth to them.» On 4 June 1649, holding their constituent assembly in a barn, the «free planters» resolved that church members only should be burgesses, and Davenport was chosen one of the «seven pillars» to support the ordinance of civil government. He exhorted the governor to judge justly, and the «cause that is too hard for you to bring it to me.» Annual elections were ordained, and God's word established as the only rule in public affairs. In his carefulness in regard to the admission of members to the Church, he held in reality also the keys of all political power. When the messengers of the king, who had come to New England in pursuit of Goffe and Whalley, the regicide judges of Charles I., approached New Haven, he hid the fugitives in his house, and preached to his congregation from Isaiah xvi. 3 and 4: «Hide the outcasts: bewray not him that wandereth. Let mine outcasts dwell with thee, Moab: be thou a covert to them from the face of the spoiler.» After the death of Wilson, the pastor in Boston, in 1667, he removed there to succeed him. He was installed in December 1668. His election caused a division in the congregation. Those who opposed his views on the «half-way covenant» withdrew and organized the Old South Church. The controversy went on for many years. Among his publications are: 'Discourse About Civil Government in a New Plantation Whose Design is Religion' (1663); 'The Knowledge of Christ Indispensably Required of All Men Who Would be Saved' (1653); 'A Catechism Containing the Chief Heads of Christian Religion' (with Hooke 1659); 'The Saints' Anchor-Hold' (1661); 'The Power of Congregational Churches Asserted and Vindicated' (1672). He was also an editor of the works of Dr. John Preston, for some time leader of the English Puritans. Consult: Mather, 'Magnalia' (1702), and Dexter, 'Sketch of the Life and Writings of Davenport' ('Papers' of the New Haven Colony Hist. Soc., Vol. II., 1877).

Davenport, Robert, English poet and dramatist: flourished about 1623; d. after 1640. He is known only through his 'A Crowne for a Conqueror, and Too Late to Call Backe Yesterday. Two Poems, the One Divine, the Other Morall' (1623); 'King John and Matilda' (1655), a tragedy; and two comedies: 'A New Trick to Cheat the Divell' (1639), and 'The City Night Cap' (printed 1661). That he was associated with Shakespeare in producing parts 1 and 2 of 'Henry VI.' seems established, and it is almost certain that he is the author of a play called 'The Pirate.'

Davenport Brothers. Ira E. (b. 1839) and William H. (b. 1841). So-called «mediums,» who professed to be adepts in spiritistic arts, and who, by their skill in performing various feats and their clever deceptions gained many followers. They flourished in 1845–65, but were finally exposed as impostors. Consult Abbot, 'The Davenport Brothers' (1864) and Barkas, 'Lecture on the Brothers Davenport' (1864). See Spiritualism.

Davenport, Ia., a city of Scott County, of which it is the county-seat, on the western bank of the Mississippi, opposite Rock Island, Ill., 330 miles above Saint Louis, and 184 miles west by south of Chicago; on the Burlington, Cedar Rapids & Northern, the Chicago, Milwaukee & Saint Paul, the Chicago, Rock Island & Pacific, and other railways. It is pleasantly situated at the foot of the Upper Rapids of the Mississippi, on the slope of a steep bluff which extends for 3 miles along the river and commands an extensive view. It is connected with the Illinois shore by an iron railway and carriage bridge, built in part by the Federal government, and costing $1,200,000, and an iron railway bridge costing $800,000. On Rock Island, which is crossed by the former structure, are the central United States arsenal and armory, military headquarters, and other government buildings.

Industries, etc.— The census of 1900 shows 416 establishments here, with a capital of $10,774,707, employing an average number of 4,348 persons at wages amounting to $1,892,737; cost of materials used, $6,854,677; value of products, $11,573,670. The surrounding region is important both agriculturally and for its coal mines. Davenport ships large quantities of farm produce, river-packets from Saint Paul to Saint Louis furnishing means of transportation in addition to that of the railways. The flour and grain business is an important one. Among the numerous manufactured products are lumber and planing-mill products, brick and stone, bread and other bakery products, carriages and wagons, agricultural implements, woolen goods, glucose and its products, foundry and machine-shop products, cordage, pottery, furniture, cigars, and cooperage products. Wholesale slaughtering and meat-packing is also carried on here.

Public Institutions, Buildings, etc.— Davenport has an Academy of Natural Sciences, the organization having been begun 14 Dec. 1867; Saint Luke's, Mercy, and other hospitals; a public library; two opera-houses; a Masonic temple, and other important buildings. It is the seat of Saint Ambrose College and other educational institutions, and of the State Orphanage; and it is an episcopal see of the Roman Catholic Church and the Protestant Episcopal Church. The Academy of Natural Sciences regularly publishes 'Proceedings,' and has a large scientific library and a fine collection of mound-builder relics.

History, Government, etc.— Davenport was founded in 1835, in the autumn of which year a company, led by Col. George Davenport, long a resident on Rock Island, was formed for the purchase of a site. In 1838 it was incorporated as a town, and in 1851 a city charter was obtained from the legislature and adopted. The Chicago & Rock Island Railway was chartered in 1851 and completed in February 1854. The government is by a mayor, biennially elected, and a city council, comprising the mayor and aldermen elected by wards and at large. The annual income is about $540,000; the expenditure is $500,000. Pop. (1890) 26,872; (1900) 35,254.

Davey, Richard Patrick Boyle, English journalist: b. 1848. He began his career in 1870 in New York, where he edited 'The Spirit of the Times'; and returning to England in 1880 has since been connected with various London journals as literary and dramatic critic. He has published: 'Sand Sea'; 'A Royal Amour' (1881); 'Weatherleigh' (1894); 'The Sultan and His Subjects' (1895); 'Victoria: Queen and Empress' (1897); 'Mary Tudor' (1898);

'Cuba: Past and Present' (1898); 'Life of Lady Jane Grey' (1902); 'Historical London' (1902); 'Lucrezia Borgia' (1903). He is also the author of the plays: 'Paul and Virginia' (1886); 'Lesbia' (1889); 'Inheritance,' produced in New York and played 1,500 times; 'St. Ronan's Well' (1893); 'Marion de l'Orme' (1894); and has lectured both in England and the United States.

David (Heb. "beloved"), **king of Israel.** He was the youngest son of Jesse, a citizen of Bethlehem, and member of the tribe of Judah. His life is recorded in the first and second books of Samuel and the first book of Chronicles. The book of Psalms, a large portion of which was composed by him, also contains frequent allusions to incidents in his life, evidently introduced for allegorical purposes, and often supposed to apply prophetically to the Messiah, of whom David was an ancestor. During Saul's life, and in consequence of his disobedience to the divine commands, the prophet Samuel was sent to anoint David, who then kept his father's flocks as king of Israel. David was afterward recommended to Saul for his skill in music, and played before him to soothe a melancholy distemper to which the king was subject. On the breaking out of war he was sent home, but being sent by his father to inquire after his brothers in the army he slew Goliath, a Philistine giant, who had defied the armies of Israel. Saul again took him to court, but exhibited extreme jealousy of him, and frequently tried to kill him. David escaped through the connivance of Jonathan, Saul's eldest son, who had formed a strong attachment for him. He now became the master of a band, composed in great part of lawless characters, but whom he seems to have disciplined and kept in subordination. He was pursued and persecuted by Saul during a great part of the remainder of that monarch's life. On the death of Saul he was crowned king of Judah at Hebron, and seven years afterward, at the close of a successful war with Ishbosheth, Saul's successor, was acknowledged king of all Israel. He reigned after this for 33 years, extending the dominions of the kingdom of Israel by conquests over the Philistines, Amalekites, Edomites, Moabites, Ammonites, and Syrians. Although generally a just and merciful prince, he committed an act of great oppression in taking possession of the wife of Uriah, one of his officers, and directing Joab, the captain of the host, to abandon Uriah at the siege of Rabbah, and permit him to be killed. For this the prophet Nathan predicted great calamities to his family and kingdom, and it was soon followed by the rebellion and death of his favorite son Absalom. Another of his sons, Adonijah, rebelled near the close of his reign. David's penitence for this offense is expressed in several beautiful psalms. He was succeeded by Solomon, his son by Bathsheba, the wife of Uriah. David made great preparations for the building of a temple at Jerusalem, which he had conquered from the Jebusites, but the work was by divine command transferred to his son Solomon, by whom it was carried out. David was born, according to Ussher, 1085 B.C., anointed king 1063, made king of Judah 1055, of Israel 1048, died 1015. Some modern authorities place his death earlier, others later. See PSALMS.

David, Saint (Welsh, DEWI), patron saint of Wales: d. 601. He was archbishop of Caerleon and afterward of Menevia, now Saint David's. He was celebrated for his piety, and many legends are told of his miraculous powers. Several theological treatises are ascribed to him.

David I. (often called ST. DAVID), king of Scotland: b. about 1080; d. Carlisle, England, 24 May 1153. He succeeded his brother, Alexander the Fierce, in 1124. He married Maud, grandniece of William the Conqueror; and was Earl of Northumberland and Huntingdon when called to the Scottish throne. On the death of Henry I., king of England, he maintained the claim of his daughter Maud against King Stephen, and seized Carlisle, but was defeated at the battle of Northallerton in 1138.

David II., king of Scotland: b. Dunfermline, Scotland, 5 March 1324; d. Edinburgh 22 Feb. 1371. He was the son of Robert Bruce (q.v.), and succeeded to the throne in 1329. On the death of his father he was acknowledged by the great part of the nation. Edward Baliol, however, the son of John Baliol, formed a party for the purpose of supporting his pretensions to the crown; he was backed by Edward III. of England. Battles were frequent, and at first Baliol was successful; but eventually David succeeded in driving him from Scotland. Still, however, the war was carried on with England with increasing rancor, till at length David was made prisoner at the battle of Neville's Cross (1346). After being detained in captivity for 11 years he was ransomed for 100,000 marks. The remainder of his reign was occupied in disputes with his parliament.

David, Armand, är'män dä-vēd, French abbé, naturalist, and missionary: b. Espeletta 7 Sept. 1826. He entered the congregation of the Lazarists in 1848, teaching the natural sciences for some time at Savone, and going, in 1862, to China, where he made an enormous collection of plants, minerals and animals, which he sent to the museum in Paris. In 1866 he undertook a new exploration, chiefly through Mongolia and eastern Tibet. In 1872 he made a third voyage to China, lasting two years. Besides the accounts of his journeys, appearing in the archives of the Museum under the title of 'Journal of My Third Voyage of Exploration in the Chinese Empire' (1875), he left many works on natural history, among which are: 'The Birds of China,' and 'Plantæ Davidianæ ex Sinorum Imperio' (1890).

Da'vid, Christian, Moravian missionary: b. Sinftleben, Moravia, 31 Dec. 1690; d. Herrnhut 3 Feb. 1751. In 1722 he was the leader of the Moravians who took refuge from persecution with Count Zinzendorf and founded their settlement at Herrnhut. In 1733 he went to Greenland, establishing the first mission there; he later made several visits to Greenland, as well as missionary journeys to Denmark, Holland, Livonia, and England.

David, dä-vēd, **Félicien Cesar,** French musician and composer: b. Cadenet, Vaucluse, 13 April 1810; d. Saint Germain, near Paris, 29 Aug. 1876. After some vicissitudes he entered the Paris Conservatoire in 1830, and became an ardent disciple of St. Simon, Enfantin, and other social speculators. In 1832, with a

few companions, he went to the East in order to realize his dreams of a perfect life, but returned disappointed in 1835. He then published his 'Mélodies Orientales,' and soon after his most successful work, the ode-symphony 'Le Désert' (1844). His other works include many compositions for strings and for the pianoforte, and 'Moïse sur le Sinai' (1846); 'Christophe Colombe' (1847); 'L'Eden' (1848); 'La Perle du Brésil' (1851); 'Herculaneum' (1859); and 'Lalla Rookh' (1863). His work abounds in felicitous and melodious expression, and is preeminently marked by the qualities characteristic of French music.

David, dä'vēd, **Ferdinand,** German violinist: b. Hamburg 19 Jan. 1810; d. Kloster, Switzerland, 18 July 1873. He was a pupil of Spohr; made his début in 1824; and was leader of Gewandhaus Concerts, Leipsic, 1836. His works, which reach Opus 39, are principally for the violin. He was the friend of Mendelssohn and the teacher of Joachim and Wilhelmj.

David, Gheerardt, gā-rärt' dä'vēt, Dutch painter: b. Oudewater about 1460; d. Bruges 13 Aug. 1523. In 1484 he entered the Painters' Guild of Bruges, of which he became dean in 1501. The National Gallery, London, contains an admirable example of his work in 'A Canon and His Patron Saints,' a wing from an altarpiece; and among his other pictures are a 'Madonna,' in the museum at Rome; a 'Crucifixion,' in Berlin; and a 'Baptism of Christ,' and a 'Descent from the Cross,' both at Bruges. See Conway, 'Early Flemish Artists' (1887).

David, Jacques Louis, zhäk loo-ē dä-vēd, French painter: b. Paris 30 Aug. 1748; d. Brussels 29 Dec. 1825. After obtaining the grand prize in Paris he studied in Rome from 1775 to 1780, devoting himself particularly to historical painting. He visited Rome a second time in 1784, and finished his masterpiece, the 'Oath of the Horatii,' which Louis XVI. had commissioned him to design from a scene in the Horaces of Corneille. In the same year he painted his 'Belisarius'; in 1787, the 'Death of Socrates'; and in 1788, 'Paris and Helen.' He finished, in 1789, a large painting representing Brutus condemning his sons to death. He also furnished the designs of the numerous monuments and republican festivals of that time. In 1792 he was chosen an elector in Paris; afterward a deputy in the National Convention; and during the Reign of Terror was one of the most zealous Jacobins, and wholly devoted to Robespierre. He proposed to erect a colossal monument of the nation on the Pont-Neuf, from the materials of the king's statue. At the trial of Louis XVI. he voted for his death. In 1799 he executed the 'Rape of the Sabine Women,' from the exhibition of which he received, as it is said, 100,000 francs. In 1804 the emperor directed him to execute four pieces, among which the coronation of Napoleon was particularly distinguished. Among his finest works of this period were many representations of the emperor, particularly that in which Napoleon was represented on horseback, on Mount St. Bernard, pointing out to his troops the path to glory. This is often engraved. In 1814 David painted 'Leonidas,' his last painting in Paris. After the second restoration of Louis XVIII. he was included in the decree which banished all regicides from France. He then established himself at Brussels, where he died in exile. The opinions of the merits of this artist are various, but the praise of correct delineation and happy coloring is universally conceded to him. He found in the history of his time, in the commotions of which he took an active part, the materials of his representations. See Mather, 'History of Modern Art' (Vol. II. 1896); Stranahan, 'History of French Painting' (1899).

Da'vid, Laurent Olivier, Canadian journalist and author: b. Sault au Recollet, Quebec, 24 March 1840. He was educated at the College of Sainte Thérèse, and was admitted to the bar in 1864. He assisted in founding the paper 'Le Colonisateur,' 'L'Opinion Publique,' and the '*Le Bien Publique.*' In the latter he attacked the Roman Catholic clergy for their interference in political matters. In 1886 he was elected to the Canadian legislature from East Montreal, but declined renomination in 1890. He has written: 'Biographies et Portraits' (1876); 'Les Héros de Chateaugay' (1883); 'Les Patriotes de 1837–8' (1884); 'Les Deux Papineau' (1896); and 'Le Clergé Canadien: sa mission et son œuvre' (1896).

David, Pierre Jean, pē-ār zhŏn, French sculptor: b. Angers 1789; d. 5 Jan. 1856. He is commonly called DAVID D'ANGERS. He became the pupil of J. L. David (q.v.), and his bas-relief of Epaminondas having gained the first prize for sculpture in 1811, he was enabled to go to Rome to perfect himself in his art. On his return to Paris he laid the foundation of his fame by a colossal statue of the great Condé in marble. In August 1826 he was nominated a member of the Academy of Fine Arts, and in December of the same year professor in the School of Painting and Sculpture. He executed busts of Goethe for Weimar, of Schelling for Munich, of Tieck for Dresden, of Rauch and Humboldt for Berlin. In 1831 he began the magnificent sculptures of the Pantheon, his most important work, which he finished in 1837. He executed a great number of medallions, busts, and statues of celebrated persons of all countries, among whom may be named Walter Scott, Canning, Washington, Lafayette, Guttenberg, Cuvier, Victor Hugo, Béranger, Paganini, and Madame de Staël. David worked with great rapidity and ease, and his chief strength consisted in his facility of invention and execution, especially in large works. In works of smaller size his drawing and modeling are seen to be deficient in fineness and accuracy.

David, dä-vēth', Colombia, South America, situated on the Isthmus of Panamá, in a fertile plain on the Rio David which enters the Pacific eight miles to the south. Stock-raising and the cultivation of tobacco are extensively engaged in; and there is a considerable trade. Pop. 9,000.

David Ap Gwilym, dä'vēd ăp gwēl'ĭm, Welsh poet of the 14th century. There is a doubt about his dates, some authorities giving 1340–1400; others 1300–68. He had a good education and considerable knowledge of Italian and Latin. His tendency to keen satire was very unpleasant to his kinsmen and neighbors, and he was at one time forced to leave home on this account. To Morvydd, the lady whom he loved, he addressed nearly 150 poems; though she returned the poet's love she was forced into an

uncongenial marriage with a wealthy man. David eloped with her, and the fine imposed on him by the husband was so heavy that he could not have paid it but for the assistance of the men of Glamorganshire. Over 250 of his poems were collected and published by Owen Jones (1789); and a translation published by Arthur James Johnes (1834). Others of his poems have been discovered in manuscript.

David City, Neb., the county-seat of Butler County; situated on the Union P., the B. & M., the F. E. & M. V. R.R.'s, and about 45 miles northwest of Lincoln, the capital of the State. It is a trade centre for the populous agricultural region surrounding the city. Pop. 2,000.

David Balfour; Being Memoirs of His Adventures at Home and Abroad, a novel by Robert Louis Stevenson, published in 1893. A sequel to 'Kidnapped,' this novel opens with the attempt of David Balfour to effect the escape of his friend, Alan Stewart, from Scotland; and to aid Stewart's brother, unjustly imprisoned on a charge of murder. He falls in love with Catriona Drummond, is imprisoned, and after his release goes to Holland, where he lives with Catriona without marriage. Her father interfering, the two are separated; but by the intervention of Alan Stewart they meet again and are married. The novel is in the romantic vein, written with Stevenson's simplicity and clearness, and is artistic in construction.

David Copperfield, a novel by Charles Dickens, which was that author's favorite among his works, and was partly autobiographical in character. It is ranked among the greatest English novels. The hero's career is given from the day of his birth. At 10, he runs away from home, having been forced by a harsh stepfather to undertake rough daily work. He is adopted by his aunt, Miss Betsy Trotwood, an eccentric but kindly woman; and finally becomes an author. After the death of his "child wife," Dora Spenlow, he marries Agnes Wickfield, an almost ideal character.

Davidge, William Pleater, American actor: b. London, England, 17 April 1814; d. Cheyenne, Wyo., 7 Aug. 1888. He made his first appearance on the stage at the Drury Lane Theatre in London; after acting in various places in England, came to the United States in 1850. He took the part of Sir Peter Teazle at the old Broadway Theatre in New York, supported Forrest and other leading actors and took part in the Shakespearean revivals at the Winter Garden Theatre in 1867. In 1869–77 he was at Daly's Fifth Avenue Theatre; in 1879 he appeared as the original Dick Deadeye in 'Pinafore'; and in 1885 he became a member of the Madison Square Theatre Company. He played over 1,000 parts, among them Hardcastle in 'She Stoops to Conquer'; Croaker in 'Good Natured Man'; Caliban in 'The Tempest'; Nick Bottom in 'Midsummer Night's Dream'; and Old Gobbo in 'The Merchant of Venice.'

Davidists, the name given to two distinct religious sects, namely, the followers of David of Dinant in the 13th century, and those of David George or Joris in the 16th. David of Dinant was a contemporary of Almaricus of Bena (Amaury de Bène), and at the death of Amaury (1204) continued to teach Amaury's pantheistic doctrine, founded on Neoplatonism, that the "All is God." David taught that holiness is simply the consciousness of the presence of God, the thought that God is the "One and the All": that he who attains the perfect view of the God-All cannot sin, no matter what enormities he commits; he is the Christ, he is the Holy Ghost. The other sect of Davidists, called also David-Georgians, after the name of their founder, who was born at Delft in 1501, had its rise in 1534. Its founder published in 1542 his 'Book of Wonders,' recounting his marvelous visions and divine revelations. But he retired from the leadership in 1544, and during the remainder of his life was a prosperous merchant at Basel, under an assumed name. By order of the senate of Basel, his body, as that of a heretic, was exhumed and burnt. The sect, with Henry Nicolas as its head, made progress in Holland and got a footing in England, being now known as Familists. The Familists taught as their chief tenet the gospel of love, divine love. Love, they held, is above all laws, whether ceremonial, moral, or civil, and the practice of the sectaries was so consonant with this doctrine that early in the 17th century the societies of Familists had to be suppressed in both countries, by the civil power.

Davids, Thomas William Rhys, English Oriental scholar: b. Colchester 12 May 1843. He was educated at the University of Breslau; from 1866 on filled judicial places in Ceylon and acted as archæological commissioner. In 1877 he was called to the London bar, and subsequently became professor of Pali and Buddhist literature in University College, London. Among his works are: 'Buddhism' (1877); translations of 'Buddhist Birth Stories' (1880); 'Buddhist Suttas' and 'Vinaya Texts' (1891), published in 'The Sacred Books of the East'; 'American Lectures' (1896); 'Sacred Books of the Buddhists; Dialogues of the Buddha' (1899); 'Buddhist India' (1902).

David's Deer (*Cervus davidianus*), a deer found in northern China and in Manchuria. It derives its name from Père David, a French Catholic missionary, who first saw it in the imperial park at Pekin. It resembles the Indian swamp-deer (q.v.), but has long, shaggy hair. It has no brow-tine. Little is known of its wild habits, for most of the representatives are found in parks and preserves in China or in Europe.

Davids Island, an island owned by the United States government and used for military purposes. It is in the waters of Long Island Sound, about 80 rods north of the limits of New York. Area about 100 acres.

Davidson, George, American astronomer: b. Nottingham, England, 9 May 1825. He came to the United States in 1832; graduated at the Central High School, Philadelphia, in 1845; and joined the United States Coast Survey. While in this service he was chief engineer of a party which surveyed a ship canal route across the Isthmus of Darien. He also made a geographical survey of the coast of Alaska in 1867. He traveled extensively in Egypt, China, India, and Europe, for purposes of scientific study, and also took charge of the telegraph-longitude work, and of the main triangulation and astronomical party carrying the geodetic work

across the continent. From 1877–84 he was regent of the University of California, and for many years was president of the California Academy of Sciences. He retired from the coast survey after 50 years of distinguished service, in 1895, and became professor of geography in the University of California.

Davidson, James Wheeler, American consul: b. Austin, Minn., 14 June 1872. He was a member of the Peary Arctic expedition to North Greenland 1893–4; war correspondent with the Chinese army 1895; and with the Japanese army 1895–6. In June 1898 he was appointed United States consul for Formosa and Loochoo Islands. He has published: 'Formosa Camphor and Its Future' (1896); 'The Island of Formosa: Past and Present' (1900).

Davidson, James Wood, American author: b. Newberry County, S. C., 9 March 1829. He was graduated from South Carolina College (now the State University) and taught Greek at the Mount Zion Collegiate Institute. During the Civil War he fought in the Confederate army as adjutant in Stonewall Jackson's army corps under Lee in Virginia. After the war he took up journalism, living in New York and Washington, and since 1887 has been in the Treasury Department at Washington. He has written: 'The Living Writers of the South' (1869); 'A School History of South Carolina'; 'The Correspondent' (1886); 'The Poetry of the Future' (1888); and 'The Florida of To-day' (1889).

Davidson, John, Scottish poet, novelist, and miscellaneous writer: b. Barrhead, Renfrewshire, 11 April 1857; d. 3 Aug. 1905. He was at first a teacher, but in 1890 adopted a literary career, writing for the 'Speaker' and other journals. He has published: 'Fleet Street Eclogues' (1893); 'A Random Itinerary' (1894); 'Ballads and Songs' (1894); 'Plays' (1894); 'Earl Lavender' (1895); 'New Ballads' (1896); 'The Last Ballad and Other Poems' (1898); 'The Testament of a Man Forbid' (1901); 'The Testament of an Empire Builder' (1902); and two novels: 'Perfervid' (1890); and 'Baptist Lake' (1894).

Davidson, John Wynn, American soldier: b. Fairfax County, Va., 18 Aug. 1824; d. St. Paul, Minn., 26 June 1881. He was a graduate from West Point in 1845; served during the Mexican war in the Army of the West, was then placed on frontier and garrison duty, and fought a battle against the Apache and Utah Indians at Cienguilla, N. Mex., in 1854, in which he lost three fourths of his command. He served in the Federal army during the entire Civil War, and in 1866 became lieutenant-colonel in the United States cavalry. He was professor of military science at the Kansas Agricultural College, and commanded various posts in Idaho, Texas, etc.

Davidson, Lucretia Maria, American poet: b. Plattsburg, N. Y., 27 Sept. 1808; d. there 27 Aug. 1825. She was remarkably precocious, and at the age of nine years wrote her first poem, 'Epitaph on a Robin.' In 1829 S. F. B. Morse collected and published her writings under the title 'Amir Khan and Other Poems.'

Davidson, Margaret Miller, American poet: b. Plattsburg, N. Y., 26 March 1823; d. Saratoga, N. Y., 1838. She was sister of L. M. Davidson (q.v.), and began to write at the age of six years. Her poems were published after her decease, with a memoir written by Washington Irving.

Davidson, Randolph Thomas, archbishop of Canterbury: b. Edinburgh, 7 April 1848. He was graduated at Trinity College, Oxford, and after holding important charges was made Bishop of Rochester in 1891; Bishop of Winchester, 1896; and succeeded the Most Rev. Frederick Temple as chief Primate of England in January 1903. He visited America in 1904. Has published 'Life of Archbishop Tait' (1891).

Davidson, Samuel, Irish biblical scholar: b. near Ballymena, Ireland, 1807; d. 1 April 1898. After entering the ministry of the Presbyterian Church, he became in 1835 professor of biblical criticism and literature in the Presbyterian Theological College in Belfast. He afterward joined the Congregationalists, and was appointed, in 1842, a professor in their college in Manchester, but had later to resign owing to his advanced opinions. His works include: 'Sacred Hermeneutics' (1843); 'Gieseler's Ecclesiastical History' (1846); 'The Ecclesiastical Polity of the New Testament' (1848); 'An Introduction to the New Testament' (1848–51); 'Biblical Criticism' (1852); 'Introduction to the Old Testament' (1862); 'Translation of Fürst's Hebrew Lexicon'; 'On a Fresh Revision of the English Old Testament' (1873); 'The New Testament Translated from the Critical Text of Von Tischendorf' (1875); 'Canon of the Bible' (1877); 'Doctrine of Last Things Contained in the New Testament' (1883).

Davidson, Thomas, Scottish philosopher and writer: b. Aberdeenshire 25 Oct. 1840; d. Montreal 14 Sept. 1900. He came to the United States in 1867, and was subsequently professor of classics in the St. Louis High School. In 1875 he settled in Cambridge, Mass. Later he traveled in Greece and Italy. Included in his publications are: 'A Short Account of the Niobe Group' (1874); 'The Place of Art in Education' (1886); 'Giordano Bruno, and the Relation of His Philosophy to Free Thought' (1886); a 'Hand-Book to Dante, from the Italian of Scartazzini' (1887); 'Prolegomena to Tennyson's «In Memoriam»'; 'Aristotle and Ancient and Modern Educational Ideals'; 'The Education of the Greek People and Its Influence on Civilization.'

Davidson, William, American general: b. Lancaster County, Pa., 1746; d. Cowan's Ford, N. C., 1 Feb. 1781. He took up arms at the outbreak of the Revolution, was major of one of the first regiments raised in Carolina, was appointed brigadier after the battle of Camden, and in 1781 was despatched by Greene to prevent Cornwallis from passing the Catawba at Cowan's Ford. With his death in the battle which ensued, and with the dispersion of his troops, began the pursuit of Greene by Cornwallis.

Davidson, William Leslie, Scottish logician: b. Meikle Wartle, Aberdeenshire, 25 May 1848. He was educated at Aberdeen University, where he has been professor of logic and metaphysics from 1895. He is the author of 'The Logic of Definition' (1885); 'English Words Explained' (1886); 'Theism as Grounded in Human Nature' (1893); 'A Philosophical Centenary' (1896); 'Christian Ethics' (1899).

Davidson College, an educational institution at Davidson, N. C.; founded in 1837, under the auspices of the Presbyterian Church. Its professors and instructors are about 20 in number; students, over 200; volumes in the library, 14,000; value of property, $300,000; income, about $20,000.

Davie, William Richardson, American soldier: b. England 21 June 1756; d. Camden, S. C., 8 Nov. 1820. He was brought to North Carolina when a child, and was graduated at Princeton, N. J., in 1776. He entered the American army, and obtained a captaincy in Pulaski's Legion. He rose to be colonel and commissary, served throughout the war, and was a favorite officer under Sumter and Greene. He was a member of the convention to form the United States Constitution in 1787, and advocated its acceptance in the convention of North Carolina. Through his influence the University of North Carolina was established. He was elected governor of that State in 1799.

Davies, dā'vēz, **Ben,** English tenor singer: b. 1858. He studied at the Royal Academy of Music; sang for many years with the Carl Rosa Opera Company; sang in Italian opera, and had the title role in 'Ivanhoe.' He also sings in oratorios and concerts, and has several times visited the United States.

Davies, Charles, American mathematician: b. Washington, Litchfield County, Conn., 22 Jan. 1798; d. Fishkill Landing, N. Y., 18 Sept. 1876. He was educated at the United States Military Academy and was appointed professor of mathematics there in 1828. He held the same post subsequently at Columbia College and in the University of New York. He published: 'Surveying' (1832); an edition of Legendre's 'Geometry'; and other works and text-books on arithmetic, mathematics, etc.

Davies, Emily, English educator: b. Southampton, England, 22 April 1830. She has been identified with the movement for the higher education of women for over 40 years; is life governor of University College, London; honorary secretary of Girton College, Cambridge; and governor of the grammar school, Hitchin. Besides numerous pamphlets, she has published, 'The Higher Education of Women' (1866).

Davies, Henry Eugene, American soldier: b. New York 1836; d. 1894. He was admitted to the bar of New York in 1857, and entering the United States volunteers as captain when the Civil War broke out, he became brigadier-general in 1863. Serving with Sheridan he was made major-general of volunteers 1865. He resigned in 1866, afterward practising law in New York. He published 'General Sheridan' in the 'Great Commanders Series' (1895).

Davies, John, English poet: b. Hereford about 1565; d. London 1618. He was the author of: 'Microcosmos' (1603); 'The Witte's Pilgrimage'; 'The Scourge of Folly'; 'Wit's Bedlam' (1617); etc.

Davies, Sir John, English poet and lawyer: b. Tisbury, Wiltshire, 1569; d. 8 Dec. 1626. He was educated at Westminster and Oxford. Called to the bar in 1595, he became solicitor-general for Ireland in 1603, and attorney-general in 1606, being knighted the next year. He was returned to the English Parliament in 1621, and appointed lord chief justice in 1626. He wrote: 'Orchestra,' a poem on dancing; 'Hymns to Astræa,' a series of acrostics; 'Nosce Teipsum,' a poem on the immortality of the soul.

Davies, Sir Louis Henry, Canadian jurist: b. Charlottetown, Prince Edward Island, 4 May 1845. He was educated at Prince of Wales College in his native town, and was called to the bar of the Inner Temple, London, in 1866. Beginning practice in Charlottetown he rose rapidly, being solicitor-general 1869 and 1871–2, premier and attorney-general of the island 1876–9, and queen's counsel in 1880. He entered the Dominion House of Commons in 1882, remaining a member till his appointment as a judge of the supreme court of Canada. He was knighted in 1897, and was minister of marine and fisheries 1896–1901. In 1898 he was one of the joint high commission on the part of Great Britain for settlement of all differences with the United States respecting Canada, and was joint delegate to Washington with Sir Wilfrid Laurier on the Bering Sea seal question the year previous.

Davies, Samuel, D.D., American clergyman: b. New Castle County, Del., 3 Nov. 1724; d. Princeton, N. J., 4 Feb. 1761. Ordained in 1747, he was at his request appointed to officiate at different places of worship in Hanover County, Va., where, the Episcopal Church being then the established church of Virginia, dissenters were obnoxious to the civil authorities. His labors were highly successful, and led to a controversy between him and the king's attorney-general as to whether the act of toleration which had been passed in England for the relief of Protestant dissenters extended also to Virginia. The ultimate decision of the question was in the affirmative. The first presbytery in Virginia was established through his exertions in 1755; and in 1758 he was chosen to succeed Jonathan Edwards as president of the College of New Jersey. A collection of his sermons was published after his death, in three volumes, and passed through several editions in Great Britain and America.

Davies, Thomas Alfred, American military officer and writer: b. Black Lake, St. Lawrence County, N. Y., 3 Dec. 1809; d. there 19 Aug. 1899. He was graduated from West Point in 1829, and became a brevet major-general of volunteers in the Civil War. Among his published works are: 'Cosmogony, or Mysteries of Creation' (1858); 'Genesis Disclosed' (1860); 'Answer to Hugh Miller and Theoretical Geologists' (1861); and 'How to Make Money, and How to Keep It' (1866).

Davies, Thomas Frederick, American Protestant Episcopal bishop: b. Fairfield, Conn., 31 Aug. 1831: d. Detroit, Mich., 9 Nov. 1905. He was a graduate of Yale in 1853, and subsequently studied at the Berkely Divinity School, where he was for a time professor of Hebrew. He was ordained in 1857, and after being successively rector of St. John's Church, Portsmouth, N. H., and St. Peter's, Philadelphia, was consecrated bishop of Michigan in 1889.

Daviess, dā'vĭs, **Joseph Hamilton,** American lawyer: b. Belford County, Va., 4 March 1774; d. Tippecanoe, Ind., 7 Nov. 1811. He was famed for his eccentricities and was commonly known as «Jo» Daviess. He was ap-

pointed United States district attorney in Kentucky and in that capacity prosecuted Aaron Burr for treason. Jo Daviess County in Illinois was named in his honor. He was killed at the battle of Tippecanoe.

Dávila, dä'vē-lä, the name of several persons well known in the history of Spanish-America: 1. Gil Gonzales. (See Central America.) 2. Juan, Spanish soldier: b. Granada, Nicaragua, 1530; served in Peru, and later under Coronado in Costa Rica, and wrote (1566) 'Relación de la Provincia de Costa Rica,' a document of historical value. 3. Coello y Pacheco, governor and captain-general of Chile, 1667–70.

Davila, Alonzo, Spanish soldier: b. city of Mexico; d. there 1566. He was supposed to be implicated in a plot to make Martin Cortes ruler of New Spain, and was executed on this account.

Davila, Enrico Caterino, ĕn-rē'ko kä-tĕr-ē'nō, Italian statesman and historian: b. near Padua, Italy, 30 Oct. 1576; d. near Verona 8 Aug. 1631. His father, a Cypriote, who fled to Venice after the conquest of Cyprus by the Turks in 1561, introduced him to the French court, where he was made page; after this he entered the French service, in which he highly distinguished himself. He subsequently entered the Venetian service, gradually rose to the post of governor of Dalmatia, Friuli, and the island of Candia, and was esteemed at Venice the first man in the republic after the doge. He is principally celebrated for his 'History of the Civil Wars of France, from 1559 to 1598' (Storia della Guerre Civili di Francia, Venice, 1630). This has been translated into several languages, and deserves a place near the works of Guicciardini and Machiavelli.

Dávila, Pedrarias, Spanish governor of the Darien colony, Castilla del Oro, and Nicaragua: b. about 1440; d. Leon, Nicaragua, July 1530. His name was originally Pedro Arias, but the form given above is better known in history. He was the brother of the Conde de Puñonrostro, and married the daughter of the Condesa de Moya, the friend of Isabel the Catholic; won distinction in the wars of Granada, and enjoyed the protection of Fonseca, bishop of Burgos, master of the affairs of the Spanish-American colonies during the reigns of Ferdinand and Isabel and Charles I. Fonseca made Dávila governor of Darien in 1514, and the governor promptly employed the adventurers who accompanied him in a number of expeditions, including that of Hernan Ponce and Bartolomé Hurtado (1516) to the coasts of the present republics of Nicaragua and Costa Rica. He established himself at Panama, and had at his command the famous soldiers Balboa, Hernandez de Córdoba, De Soto, Ojeda, Olid, Ponce, and Francisco Pizarro. In 1526–7 he asserted that, as governor of Castilla del Oro, he ought to administer Nicaragua and Honduras as well. His claim to the former was recognized. Balboa suffered death in consequence of incurring his enmity. Pedrarias is cited most frequently as the type of the vigorous, but wholly unscrupulous official of the first period of Spanish colonization on the American mainland.

Dávila y Padilla, ē pä thēl yä, **Augustin,** Mexican historian: b. Mexico 1562; d. Santo Domingo 1604. He entered the order of Dominicans in 1578, taught philosophy and theology at the College of La Puebla and Mexico, becoming prior of his convent La Puebla, and procurer of his order at the courts of Madrid and Rome 1596. He became preacher for Philippe II. 1598, and was consecrated as archbishop of Santo Domingo 1601. He burned several hundred copies of the Bible translated into Spanish and annotated by Protestants. He wrote 'Historia de la provincia de Santiago de Mejico' (1596–1634); and 'Ancient History of the Mexicans.'

Da Vinci, Leonardo. See Vinci, Leonardo Da.

Davis, Andrew Jackson, American spiritualist and author: b. Orange County, N. Y., 11 Aug. 1826. He is a resident of Boston, Mass., and the author of more than 30 volumes, chief among which are: 'The Great Harmonia'; 'Harmonial Man'; 'Philosophy of Spiritual Discourse'; 'The Penetralia.'

Davis, Charles Belmont, American author: b. Philadelphia, Pa., 24 Jan. 1866. He is a son of Rebecca Harding Davis (q.v.), was educated at Lehigh University, and was United States consul at Florence, Italy, for some time. He has written 'The Borderland of Society.'

Davis, Charles Henry, American mathematician: b. Boston 16 Jan. 1807; d. Washington, D. C., 18 Feb. 1877. He entered the United States navy in 1823, served in the Civil War, and became rear admiral in 1863. He made several coast surveys, and wrote: 'Memoir upon the Geological Action of the Tidal and Other Currents of the Ocean'; and 'The Law of Deposit of the Flood Tide.' He was one of the founders of the 'American Nautical Almanac.'

Davis, Charles Henry Stanley, American physician and Egyptologist: b. Goshen, Conn., 2 March 1840. He studied medicine in New York and in European hospitals and subsequently settled in Meriden, Conn., of which he was mayor 1887–8 and city treasurer 1897–9. He has published 'History of Wallingford and Meriden'; 'The Voice as a Musical Instrument'; 'Classification, Education and Training of Feeble Minded, Imbecile and Idiotic Children'; 'The Egyptian Book of the Dead' (edited); 'History of Egypt in the Light of Modern Discoveries'; 'Grammar of the Old Persian Language.' He has been editor of 'Biblia,' a journal of Oriental archæology, for 14 years and is a member of many learned societies.

Davis, Cushman Kellogg, American legislator: b. Henderson, N. Y., 16 June 1838; d. St. Paul, Minn., 27 Nov. 1900. He was graduated at the University of Michigan in 1857; was admitted to the bar, but enlisted in the Union army in 1861. He began the practice of law in St. Paul in 1865; was chosen to the Minnesota legislature in 1867; became United States district attorney in 1868; governor in 1874; and United States senator in 1887, 1893 and 1899. He was a Republican, and a member of the peace commission which negotiated the treaty between Spain and the United States in 1898. He was for several years chairman of the Senate Committee on Foreign Relations, and reported the resolution which practically declared war against Spain.

Davis, David, American jurist: b. Cecil County, Md., 9 March 1815; d. Bloomington, Ill., 26 June 1886. He was graduated at Kenyon College in 1832, and settled in Illinois as a lawyer in 1835. He was elected to the legislature in 1844 and served as a State circuit judge from 1848 to 1862. In the latter year he was appointed an associate justice of the Supreme Court of the United States. He voted in favor of the Legal Tender Act. He resigned in 1877 to enter the United States Senate, of which he became president pro tem. in 1881, and retired in 1883.

Davis, Edwin Hamilton, American archæologist: b. Ross County, Ohio, 22 Jan. 1811; d. New York 15 May 1888. He was the author of 'Ancient Monuments of the Mississippi Valley' (1848), which was described by A. Morlot, the distinguished Swiss archæologist, as being "as glorious a monument of American science as Bunker Hill is of American bravery."

Davis, George Royal, American financier: b. Palmer, Mass., 3 June 1840; d. Chicago 25 Nov. 1899. He enlisted for the Civil War, rising to the rank of colonel, and resigning from the army in 1871. From 1879 to 1885 he was a Republican member of Congress, and served for years on the Republican National Committee. He was director-general of the World's Columbian Exposition, Chicago, in 1893.

Davis, Henry Gassaway, American capitalist and legislator: b. Baltimore, Md., 16 Nov. 1823. He became superintendent of the plantation of ex-Gov. George Howard of Maryland, near Woodstock, Md., and subsequently was brakeman and conductor on the Baltimore & Ohio railway, and agent at Piedmont, W. Va. Then he was active as a merchant and collier at Piedmont, and later carried to success the West Virginia Central & Pittsburg Railway, by means of which he gave access to timber and coal lands of great value. The president of this road, he also became president of the Piedmont & Cumberland line. He was elected as a Democrat to the West Virginia House of Delegates in 1865, was State senator in 1867–9, and having served two terms (1871–83) as United States senator, declined re-election. In July 1904 he was nominated by the Democratic party for the vice-presidency of the United States. He was a delegate to the Pan-American congress, and became also a member of the Intercontinental Railway Commission.

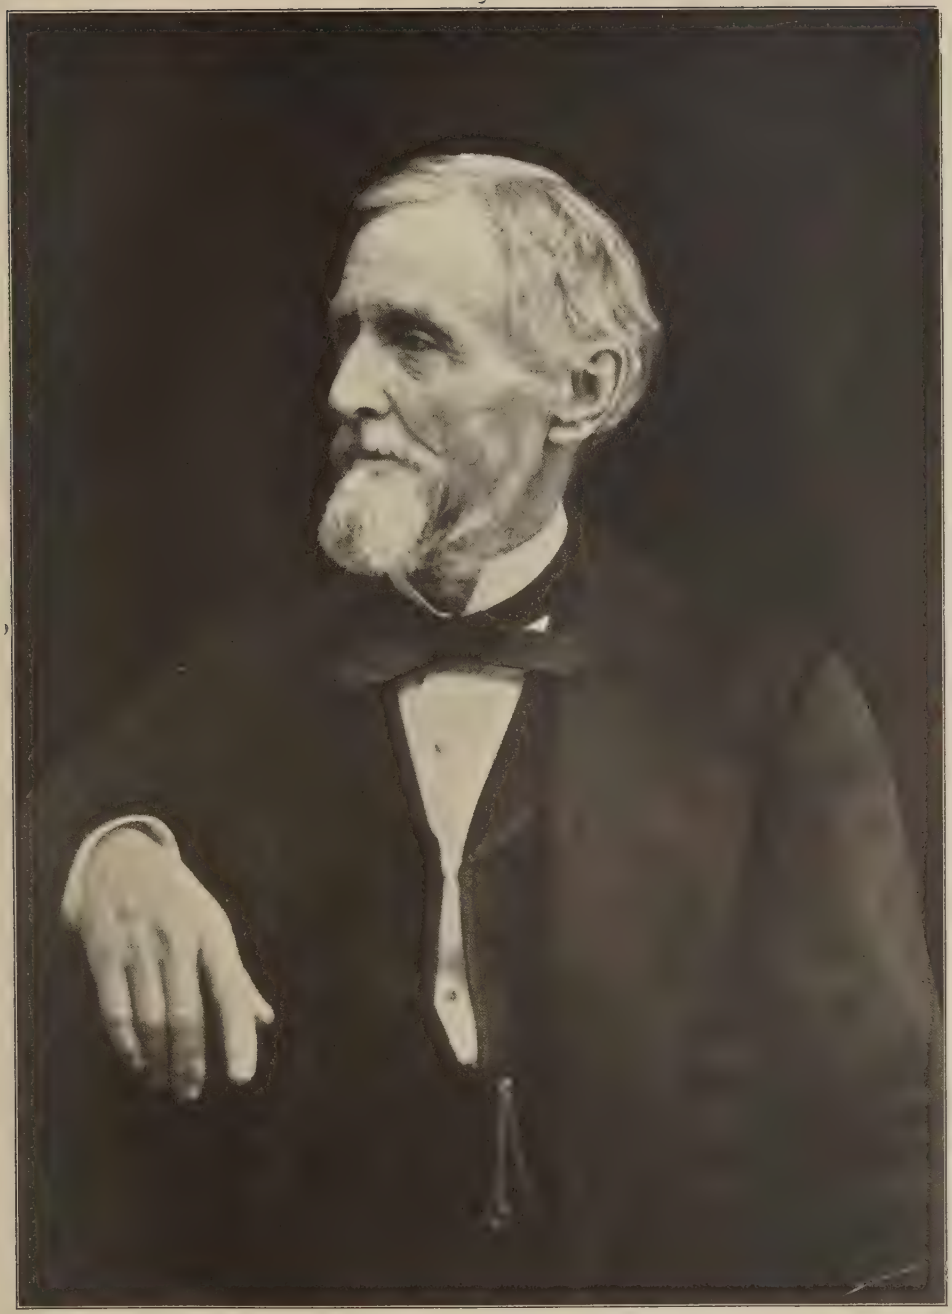
Davis, Henry Winter, American statesman and orator: b. Annapolis, Md., 16 Aug. 1817; d. Baltimore, Md., 30 Dec. 1865. He was a member of Congress for three terms (1856–65), and took a leading part in advocating emancipation and loyalty to the Union. His published works are: 'The War of Ormuzd and Ahriman in the 19th century' (1853); 'Speeches and Addresses in Congress' (1867).

Davis, Jefferson, American statesman: b. Abbeville, Christian County, Ky., 3 June 1808; d. New Orleans, La., 6 Dec. 1889. When he was three years old, his father removed with his family to Wilkinson County, Miss. He received an academical education and entered Transylvania University, Lexington, Ky., in 1822, which he left in 1824 to enter the United States Military Academy, from which he was graduated in 1828. He was appointed a second lieutenant of infantry, and served on the northwestern frontier during the Black Hawk war of 1831–2. In 1831 he was promoted to first lieutenant of dragoons for gallantry in action, and was employed in operations against the Pawnees, Comanches, and other Indian tribes. In June 1835, he resigned his commission, and retired to a cotton plantation in Mississippi. He continued in retirement until 1843, when he began to take an interest in politics upon the Democratic side; and in 1844 was chosen a presidential elector. In 1845 he was elected a representative to Congress; but resigned in 1846, having been elected colonel of the First Mississippi Volunteer Regiment or rifles, and served in the Mexican war, greatly distinguishing himself at Monterey and Buena Vista, and being severely wounded in the latter battle. He was appointed a brigadier-general of volunteers by President Polk in 1847, but declined the commission on the grounds that, by the Constitution, the militia appointments were reserved to the States, and that such appointments by the President were in violation of State rights.

The same year he was chosen to fill a vacancy in the United States Senate, and was re-elected by acclamation in 1850 for a full term. In 1853 he was appointed secretary of war by President Pierce, and in 1857, was again elected to the United States Senate, when he took a prominent place among the Southern leaders, and was among the most determined of them all in his assertions of the rights of the States under the Constitution, and also of the right of secession. On 21 Jan. 1861, he took his leave of the Senate in a speech in which he gave his opinion that, by the secession of his State, his connection with that body was terminated, and reaffirmed the doctrine of the right of secession. The Confederate Congress, at Montgomery, Ala., chose him President, under the Provisional Constitution, on 9 Feb. 1861, and he accepted the office on the 16th in a brief address, in which he expressed his desire for the maintenance of peaceful relations with the States which remained in the Union. He asserted that all that the seceding States desired was to be "let alone," but announced that, if war should be forced upon them, they would make the enemies of the South "smell southern powder and feel southern steel."

When Fort Sumter was reduced by the Confederates, and war declared, he found it necessary to put all his previous experience into the immense task of organizing the military resources of the seceding States. He may be said to have created the army, the navy, the arsenals, and all the organization necessary to carry on a war which lasted four years. He bore himself through the varying struggle with untiring energy, and when, in 1865, a feeling of despair spread over the Southern States, he was the last to admit that they had been defeated.

On 17 April, two days after the first proclamation of President Lincoln, he responded by a proclamation authorizing privateering; and on 14 August issued a second one, warning all persons of 14 years and upward, owing allegiance to the United States, to leave the Confederacy within 40 days, or be treated as alien enemies. On 6 November he was chosen permanent President, and was inaugurated 22 Feb. 1862. On 21 May he approved an act in answer to one enacted by the United States



JEFFERSON DAVIS.

government, providing that all persons owing debts to parties in the North should pay the same into the Confederate treasury. Mr. Davis continued to be President of the southern Confederacy until his capture at Irwinsville, Ga., 10 May 1865, having left Richmond a few hours before Gen. Lee withdrew his troops, and after Gen. Lee's surrender, when he was endeavoring to reach the army of the West. He was conveyed to Fort Monroe, and indicted by the grand jury of the District of Columbia for treason. He was never brought to trial; never asked pardon, and only asked a trial; but, after two years' imprisonment, was released, at the instance of the government, on bail, Horace Greeley becoming one of his sureties. He was included in the General Amnesty Act of Congress, 25 Dec. 1868. In 1871 he had a public reception at Atlanta, Ga., and made a speech in which he reaffirmed his adhesion to the doctrine of State sovereignty. For several years after the war he was president of a southern insurance company and resided in Memphis, Tenn. The last years of his life were spent at Beauvoir, Miss., on an estate that he bought of Mrs. Dorsey before her death. In 1893 amid imposing ceremonies his remains were removed to Richmond, Va., and re-interred in Hollywood cemetery. A number of works have been published on the official life of Mr. Davis, and he himself gives a narrative of the stirring events of 1861–5 in 'The Rise and Fall of the Confederate Government' (1881). A more personal view of the Confederate leader is depicted in 'Jefferson Davis, a Memoir by His Wife' (1890). MRS. JEFFERSON DAVIS.

Davis, Jefferson Columbus, American military officer: b. Clark County, Ind., 2 March 1828; d. Chicago, 30 Nov. 1879. He left school for the Mexican war, in which he received a commission for gallantry. He was with the garrison at Fort Sumter, S. C., as first lieutenant when its bombardment began the Civil War. He received the brevet of major-general of volunteers, and the full rank of colonel in the regular army for distinguished service on the Union side during the war. For some years after the war he was stationed on the Pacific coast, and was the first United States army officer to hold command in Alaska, a new post, Port Davis, being named after him in 1900.

Davis, Jessie Bartlett, American contralto singer: b. Morris, near Chicago, 1860; d. Chicago 14 May 1905. She began her musical career as a church-choir singer; became noted as "Little Buttercup" in 'Pinafore,' presented by the Chicago Church Choir Opera Company 1879, and in 1882 filled the role of Siebel to Adelina Patti's "Marguerite," in 'Faust.' She was a pupil of Albiles and later studied a year in Paris with Madame La Grange. She was married to W. J. Davis in 1880, and in 1886 joined the American Opera Company as leading contralto, her husband managing the company. For many years she took leading contralto parts with 'The Bostonians,' achieving great success in "Alan-a-Dale" in 'Robin Hood.'

Davis, John, English navigator: b. Sandridge, near Dartmouth, Devonshire, about 1550; d. 30 Dec. 1605. In 1585 he was sent out with two vessels to find a northwest passage, when he discovered the strait which still bears his name. He afterward explored the coasts of Greenland and Iceland, proceeding as far as lat. 73° N. He made five voyages to the East Indies, on the last of which he was killed in an engagement with some Japanese pirates off the coast of Malacca. He wrote an account of his voyages, and invented a quadrant.

Davis, John Chandler Bancroft, American lawyer and diplomatist: b. Worcester, Mass., 29 Dec. 1822. In 1849 he went to London as secretary of the United States legation; in 1854 became American correspondent of the London *Times,* and in 1869, 1871, and 1873–4 was assistant secretary of state. He represented the United States in the "Alabama" contest, zealously pushing the "indirect" claims; was minister to Germany in 1874–7; and judge of the United States court of claims in 1878–82; and became reporter of the United States Supreme Court in 1883. He is the author of: 'The Massachusetts Justice' (1847); 'Mr. Sumner, the Alabama Claims, and their Settlement' (1878); a work published in French entitled 'Process Tribunals of the United States' (1878); and many volumes of United States Supreme Court reports.

Davis, Mary Evelyn Moore, American novelist: b. Talladega, Ala., 1852; married Thomas E. Davis in 1874. She has published: 'Minding the Gap and Other Poems'; 'In War Times at La Rose Blanche'; 'Under the Man-Fig' (1895); 'An Elephant's Track and Other Stories'; 'Under Six Flags'; 'The Wire Cutters' (1899); 'The Queen's Garden' (1900); 'Jaconetta.'

Davis, Matthew L., American writer: b. 1766; d. Manhattanville, N. Y., 21 June 1850. He was originally a printer by trade, and acquired in the course of that business a desultory education and considerable skill as a writer. He early attached himself in politics to the fortunes of Aaron Burr, and was an advocate of his elevation to the presidency. For many years he was the correspondent at Washington of the New York *Courier and Enquirer,* under the signature of "The Spy in Washington." For the London *Times* also he wrote under the name of the "Genevese Traveller." During many years before the death of Aaron Burr Mr. Davis was apparently his only attached friend, and the most important of his writings is his 'Memoirs of the Life of Aaron Burr.' Burr's diary was also edited by him.

Davis, Minnie S., American author and lecturer: b. Baltimore, Md., 1835. She was educated at the Green Mountain Liberal Institute, Vermont. After being an invalid for 25 years with spinal disease, she was healed in 1885 by "Mental Science," as she believes, and has since written and lectured upon that topic. Her published books are: 'Marion Lester' (1850); 'Clinton Forest' (1858).

Davis, Nathan Smith, American physician: b. Greene, N. Y., 9 Jan. 1817; d. Chicago, Ill., 16 June 1904. He studied medicine and since 1849 has practised his profession in Chicago. He was one of the founders of the Chicago Medical College, now a department of Northwestern University and was a professor there for 30 years, resigning in 1898. He has edited several medical journals and pub-

lished: 'Principles and Practice of Medicine'; 'Medical Education and Reform'; 'Verdict of Science Concerning the Effects of Alcohol on Man.'

Davis, Noah, American lawyer: b. Haverhill, N. H., 19 Sept. 1818; d. New York city, 20 March 1902. He was admitted to the New York State bar in 1841 and practised for some time in Buffalo. He was justice of the New York supreme court 1857–68, and again 1872–87. The noted cases of Edward Stokes for the murder of James Fisk, Jr., and of William M. Tweed for malfeasance, were tried before him.

Davis, Noah Knowles, American philosophical writer: b. Philadelphia, Pa., 15 May 1830. He was educated at Mercer University, Ga., and after holding various educational positions, has been professor of philosophy at the University of Virginia from 1873. He has published: 'The Theory of Thought' (1880); 'Elements of Deductive Logic' (1890); Elements of Psychology' (1892); 'Judah's Jewels: a study in the Hebrew Lyrics' (1895); 'Elements of Ethics' (1900); 'Synopsis of Events in Life of Jesus of Nazareth' (1900); 'The Nazarene' (1901).

Davis, Oscar King, American journalist: b. Baldwinsville, N. Y., 13 Jan. 1866. He was graduated from Colgate University in 1888 and was a special correspondent for the New York *Sun* and 'Harper's Weekly' at Manila 1898–9, and in China in 1900. He has published: 'Our Conquests in the Pacific.'

Davis, Rebecca Blaine Harding, American novelist: b. Washington, Pa., 24 June 1831. She was married to L. C. Davis in 1863. She contributed many short stories and sketches to periodicals, and has written several novels, including: 'Life in the Iron Mills' (1861); 'A Story of To-day' (1861), published later under the title 'Margaret Howth'; and 'A Law Unto Herself' (1878). She was the first writer in this country to introduce the labor question into fiction. Her later works include: 'Waiting for the Verdict'; 'Dallas Galbraith'; 'Natasqua'; 'Frances Waldeaux'; 'Doctor Warrick's Daughters'; 'Silhouettes of American Life.'

Davis, Richard Harding, American novelist and littérateur: b. Philadelphia 18 April 1864. He is a son of Rebecca Harding Davis (q.v.). He was graduated at Lehigh University, and entered journalism in Philadelphia. His first purely literary success was the story of 'Gallegher,' based upon his newspaper experiences, and published with other stories in a volume (1891). He has since been constantly engaged in story-writing, and descriptive narration of events, places, and people. Among his works are 'Stories for Boys' (1891); 'The West from a Car Window' (1892); 'Van Bibber and Others' (1892); 'Our English Cousins' (1894); 'The Rulers of the Mediterranean' (1894); 'The Princess Aline' (1895); 'About Paris' (1895); 'Three Gringoes in Venezuela and Central America' (1896); 'Soldiers of Fortune' (1897) 'Cuba in War Time' (1898); 'A Year From a Reporter's Note Book' (1898); 'Cinderella, and Other Stories'; 'Exiles'; 'The Lion and the Unicorn' (1899); 'Episodes from a Car Window' (1899); 'With Both Armies in South Africa' (1900); 'Miss Civilization' (1905). He was a war correspondent in Cuba (1898) and in South Africa (1900).

Davis, Thomas Osborne, Irish poet: b. Mallow, County Cork, 14 Oct. 1814; d. Dublin, 16 Sept. 1845. His verse was mainly on patriotic themes, and appears, collected, in Duffy's 'Library of Ireland.'

Davis, Val, English artist: b. Liverpool, England, 1854. He studied art under his father, William Davis, a painter of some note, and under Ford Madox Brown, and has exhibited at the Royal Academy almost continuously from 1875.

Davis, Varina Anne Jefferson, American novelist: b. Richmond, Va. 27 June 1864; d. Narragansett Pier, R. I., 18 Sept. 1898. She was called "the Daughter of the Confederacy," her father being Jefferson Davis, the President of the Confederate States. Her education was obtained partly in the United States and partly in Germany and France, and she wrote 'The Veiled Doctor,' a novel, and 'A Romance of Summer Seas.'

Davis, Varina Howell Jefferson, American writer: b. Vicksburg, Miss., 7 May 1826; d. New York City, 16 Oct. 1906. She was the second wife of Jefferson Davis (q.v.). She was her husband's amanuensis when he wrote his 'Decline and Fall of the Confederate Government' and was the author of 'Jefferson Davis: a Memoir, by His Wife' (1890).

Davis, William Morris, American geologist and meteorologist: b. Philadelphia, Pa., 12 Feb. 1850. He has been professor of geology at Harvard University from 1890 and has published 'Elementary Meteorology'; 'Physical Geography'; 'Whirlwinds, Cyclones and Tornadoes' (1884), and many professional papers.

Davis, William Thomas, American lawyer and author: b. Plymouth, Mass., 3 March 1822. He was educated at Harvard and was admitted to the bar in 1849. He was at the head of the government of his native town for many years, and has published 'History of Plymouth'; 'Ancient Landmarks of Plymouth'; 'History of the Bench and Bar of Massachusetts'; etc.

Davis, William Watts Hart, American writer: b. Southampton, Bucks County, Pa., 27 July 1820. He was graduated at Norwich University in 1842; was instructor in the military academy at Portsmouth, Va., in 1842, and was admitted to the bar in 1845. He served in the Mexican war and was mustered out as captain in 1848. Removing to New Mexico he was United States district attorney, attorney-general, secretary of the treasury, acting governor, superintendent of Indian affairs and superintendent of public buildings, beside publishing the Santa Fe *Gazette* for two or three years. He attained the rank of brevet brigadier-general in the civil war between the States, was twice defeated as Democratic nominee for Congress, and was United States commissioner to the Paris Exposition in 1878. He has published 'El Gringo: or New Mexico and Her People'; 'Spanish Conquest of New Mexico'; 'History of Bucks County'; etc.

Davis Strait, a strait on the west coast of Greenland, which connects Baffin Bay with the Atlantic Ocean. At its narrowest point, immediately north of the Arctic circle, it measures about 200 miles across. In 1888 the identity between Ginnunga Gap, referred to in the Sagas, and the present Davis Strait, was demonstrated. See DAVIS, JOHN.

Davit. (1) A beam projecting from a ship's bow, for the attachment of the tackle whereby the anchor-fluke is lifted without dragging against the side of the vessel. The operation is nautically called "fishing the anchor." (2) One of a pair of cranes on the gunwale of a ship, from which are suspended the quarter or other boats. The boat-tackles are attached to rings in the bow and stern of the boat respectively, and the fall is belayed on deck. When the boat is lowered the hooks of the fall-blocks are cast off simultaneously, or great danger results when the ship is under way.

Dav'itt, Michael, Irish political leader: b. near Straid, County Mayo, 25 March 1846; d. Dublin, 31 May 1906. Evicted from their home, the family emigrated to Haslingden in Lancashire (1851). In 1866 he joined the Fenian movement, and was sentenced in 1870 to 15 years' penal servitude. He was released in 1877; and, supplied with funds from the United States, began some two years later an anti-landlord crusade in Ireland, which culminated in the foundation of the Irish Land League (21 Oct. 1879). Davitt was thenceforward in frequent collision with the government, and from February 1881, to May, 1882, was imprisoned in Portland for breaking his ticket-of-leave. His 'Leaves from a Prison Diary' were published in 1885. Other works by him are: 'Defence of the Land League' (1891); 'Life and Progress in Australia' (1898); 'The Boer Fight for Freedom' (1902). The views of the "Father of the Land League" on the subject of land therein take a Socialistic form, and accordingly, though a strong Home Ruler, on the question of land nationalization he found himself in opposition to the Parnellites. After the split in the party, he opposed the continued leadership of Mr. Parnell, and was returned to Parliament in 1892 as an anti-Parnellite, but unseated on petition, on the ground of clerical and other intimidation. He was returned unopposed for South Mayo in 1895, resigning in 1899.

Da'vium. See DAVYUM.

Davos, dä'vōs, a valley and district of Switzerland in the canton of Grisons, lying at a considerable elevation among the Alps, and now a favorite place of residence both in summer and winter for people troubled with tuberculosis. The valley is about 10 miles long, shut in by mountains from 6,000 to 10,000 feet high, and exhibiting many picturesque features. The chief centre of population is Davos-Platz, a place of 5,000 inhabitants, containing numerous hotels, boarding-houses, and other establishments for visitors, and having a handsome town-house, and an English church. It is well sheltered on the north and east, and the air is remarkably pure and dry.

Davout, Louis Nicolas, loo-ē nĭk-ō-lä dävoo, marshal of France: b. Annoux 10 May 1770; d. Paris, 1 June 1823. He entered the army in 1785, took sides with the revolutionists, fought several battles under Dumouriez, and was made a brigadier-general in 1793. He accompanied Napoleon in his Italian campaigns and in his expedition to Egypt. In 1804 he was made a marshal of the empire. The victories of Ulm and Austerlitz were mainly due to him, as also those of Eckmühl and Wagram. For these meritorious services he was created Duke of Auerstadt and Prince of Eckmühl. After the retreat from Moscow he defended Hamburg against all the forces of the allies, and surrendered only after the peace of 1814. When Napoleon returned from Elba, Davout was appointed his minister of war. After the battle of Waterloo he lived in retirement till 1819, when he took his seat in the Chamber of Peers.

Davy, SIR **Humphry,** English chemist: b. Penzance, Cornwall, 17 Dec. 1778; d. Geneva, Switzerland, 29 May 1829. A taste for chemistry, which he displayed in some experiments on the air contained in sea-weed, attracted the attention of Mr. Gilbert, president of the Royal Society, and Dr. Beddoes, and the latter offered him the place of assistant in his laboratory. Here Davy discovered the respirability and exhilarating effect of the nitrous oxide. He published the results of his experiments, under the title of 'Chemical and Philosophical Researches' (1800). This work immediately obtained him the place of professor of chemistry in the Royal Institution, at the age of 22. In 1803 he was chosen a member of the Royal Society. His lectures at the Royal Institution were attended by crowded and brilliant audiences, attracted by the novelty and variety of his experiments, the eloquence of his discourses, and the clearness of his exposition. His discoveries with the galvanic battery, his decomposition of the earths and alkalies and ascertaining their metallic bases, his demonstration of the true nature of oxymuriatic acid, his discovery of chlorine as an element, etc., obtained him a European reputation; and in 1808 he received the Napoleon prize of the French Institute. In 1812 he was knighted. In 1813 appeared his valuable 'Elements of Agricultural Chemistry.' The numerous accidents arising from fire-damp in mines led him to enter upon a series of experiments on the nature of this explosive gas, the result of which was the invention of his safety-lamp (1815). In 1818 he received a baronetcy. In 1820 he succeeded Sir J. Banks as president of the Royal Society. Near the close of his life he wrote his 'Salmonia, or Days of Fly-fishing'; and his 'Consolations in Travel, or the Last Days of a Philosopher.' Besides the works already mentioned, he also wrote: 'Elements of Chemical Philosophy' (1802); 'Bakerian Lectures' (1807–11); 'On the Safety-lamp' (1818); etc. A statue was erected to him at Penzance in 1872.

Davy, John, English composer: b. Upton-Helion, Exeter, 1765; d. London 22 Feb. 1824. He was a teacher of music in London and wrote music for popular songs. His air, 'The Bay of Biscay, Oh!' is famous.

Davy Jones, a sailor's familiar name for a malignant sea-spirit or the devil generally. The common phrase "Davy Jones' locker" is applied to the ocean as the grave of men drowned at sea. A very dubious explanation of the name makes it compounded from Duffy, a West Indian negro spirit name, and the scriptural prophet Jonah, in jocular allusion to his somewhat unusual adventure.

Davy Lamp, the safety-lamp of Sir Humphry Davy, in which a wire-gauze envelope covers the flame-chamber and prevents the passage of flame outward to the explosive atmosphere of the mine, while it allows circulation of air.

Dav'yum, or **Davium** (named in honor of Sir Humphry Davy), a substance observed by Kern, in June 1877, in certain Russian ores of platinum, and believed by him to be a metallic element. It is hard, infusible, malleable at a red heat, silvery in lustre, and soluble readily in aqua regia and feebly in boiling sulphuric acid. Mallet (Am. Chem. Jour., Vol. XX., p. 776) has shown that davyum is not an element, but that it consists of a mixture of zircon, osmium, iridium, and finely divided quartz.

Daw. See JACKDAW.

Dawalla (*Hypophthalmus dawalla*), a fish of the family *Siluridæ*, found in the rivers of Guiana, and highly esteemed for the delicacy of its flesh. It is sometimes two and a half feet long, and is brightly colored. The eye is situated below the angle of the mouth.

Dawant, Albert Pierre, äl-bār pē-ār dä-vän, French historical painter: b. Paris 21 Sept. 1852. He was a pupil of J. P. Laurens. He took a medal of the third class 1880, and second class 1885. Among his works are: 'St. Thomas à Becket' (1879); 'Henry IV. of Germany Before Pope Gregory VII.' (1880); 'Last Moments of Charles II. of Spain' (1881); 'Burial of an Invalide' (1882); 'Salute to the Invalides' (1884); 'St. John the Hospitaller' (1885); 'Embarking of Emigrants'; and 'The Rescue' (1889); 'In Alsace' (1892); 'Teaching the Children' (1888), in the Luxembourg Museum; 'End of the Mass' (1890); 'A Rehearsal' (1894); 'Marshall Lannes at Convent of St. Pollen' (1895); 'The Captive' (1896).

Dawe, Carlton, English novelist. He has written: 'Mount Desolation'; 'The Emu's Head'; 'Yellow and White'; 'Kakemonos'; 'Captain Castle'; 'The Voyage of the Pulo Way'; 'A Bride of Japan'; 'The Mandarin'; 'Rose and Chrysanthemum'; 'The Yellow Man'; 'Claudia Pole'; 'Straws in the Wind'; 'The Demagogue.'

Dawes, Anne Laurens, American writer: b. North Adams, Mass., 14 May 1851. She is the daughter of H. L. Dawes (q.v.) and has been Washington correspondent of several New England papers, besides being prominent in various philanthropic and other organizations. She is the author of 'How We are Governed' (1885); 'The Modern Jew: His Present and Future' (1886); 'Explanation of the Constitution and Government of the United States' (1895); 'Charles Sumner' (1892).

Dawes, Charles Gates, American financier: b. Marietta, Ohio, 27 Aug. 1865. He was educated at Marietta College and the Cincinnati Law School, was for some time engaged in civil engineering, and practised law in Lincoln, Neb., 1887–94. He was active in Republican politics, and in 1897 became comptroller of the treasury. He is the author of 'The Banking Systems of the United States.'

Dawes, Henry Laurens, American legislator: b. Cummington, Mass., 30 Oct. 1816; d. Pittsfield, Mass., 5 Feb. 1903. He was graduated at Yale in 1839. Becoming a lawyer, he entered the State Senate as a Republican and in 1857 was elected to Congress, serving in the House until 1873. He was elected to the United States Senate in 1875, and was re-elected in 1881 and 1887. The condition of the Indian tribes especially claimed his attention, and after his retirement from Congress he was at the head of the Commission to the Five Civilized Tribes.

Dawes, Rufus, American poet: b. Boston 26 Jan. 1803; d. Washington, D. C., 30 Nov. 1859. He wrote 'The Valley of the Nashaway, and Other Poems' (1830); 'Geraldine' (1839), resembling 'Don Juan' in form and treatment; the successful romance 'Nix's Mate' (1840). His verses were sung at the laying of the corner-stone of Bunker Hill monument.

Dawes, William Rutter, English astronomer: b. London 19 March 1799; d. Haddenham, Buckinghamshire 15 Feb. 1868. He is principally celebrated for his accurate measurements of double stars and for his investigation into the minute details of the solar surface.

Dawes' Holes, minute circular spots on the nucleus of a sun-spot, darker than the rest of the nucleus, and supposed to be the mouths of tubular orifices penetrating to unknown depths. They were first observed by the astronomer whose name they bear.

Dawk, or Dak, a term in India for postal traveling arrangements, as by palanquins or other carriages.

Dawkins, John. See ARTFUL DODGER, THE.

Dawkins, William Boyd, English geologist: b. Buttington, near Welshpool, Montgomeryshire, 26 Dec. 1838. In 1862 he joined the Geological Survey, became curator of Manchester Museum in 1869, and professor of geology in Owens College there in 1874. In 1882 he presided over the anthropological section at the Southampton meeting of the British Association. The Channel Tunnel Committee employed him in 1882 to make a special survey of both coasts, and next year he laid down the line for a tunnel under the Humber. He is a Fellow of the Royal and other learned societies, and has contributed numerous papers to their issues relating especially to fossil mammalia. His chief works are: 'Cave-hunting: Researches on the Evidences of Caves Respecting the Early Inhabitants of Europe' (1874); 'Early Man in Britain, and His Place in the Tertiary Period' (1880); the latter a work of great interest; 'British Pleistocene Mammalia' (1866–87).

Dawlish, dâ'lĭsh, popular watering place in Devonshire, England, situated at the entrance of a valley which extends inland from the English Channel, between the mouths of the Teign and Exe. Its genial climate, its bathing facilities, and other attractions render it a place of great resort. Pop. (1901) 4,003.

Dawson, Alec John, English novelist and traveler: b. Wandsworth, England, 1871. He has traveled extensively in the South Seas, Africa, South America, etc., and is the author of 'Middle Greyness'; 'Mere Sentiment'; 'Leeway'; 'God's Foundling'; 'The African Nights' Entertainments'; 'Bismillah'; 'In the Bight of Benin'; 'Daniel Whyte'; 'The Story of Ronald Kestrel'; 'Joseph Klassin: Half Caste.'

Dawson, George Mercer, Canadian geologist: b. Pictou, Nova Scotia, 1 Aug. 1849; d. 1901. He was a son of Sir J. W. Dawson (q.v.) and was educated at McGill University and at the Royal School of Mines in London. In 1874 he was made assistant director

and in 1895 director of the Geological Survey of Canada. He was the author of 'Geology and Resources of the Forty-ninth Parallel,' and similar works.

Dawson, Henry, English landscape painter: b. Hull 3 April 1811; d. Chiswick 13 Dec. 1878. In early life he was a worker in a Nottingham lace-factory, but this occupation he gave up for art in 1835. After struggling some time at Nottingham he removed to Liverpool in 1844, and thence to Croydon in 1850, and subsequently he resided at Chiswick. It was long before his abilities were fully recognized, and his pictures began to bring high prices only a little before his death. Among the best of them are 'Wooden Walls of Old England'; 'London from Greenwich Hill'; 'Houses of Parliament'; 'The Rainbow'; 'Rainbow at Sea'; 'The Pool Below London Bridge.'

Dawson, Sir John William, Canadian geologist: b. Pictou, Nova Scotia, 13 Oct. 1820; d. Montreal 19 Nov. 1899. He was educated at Edinburgh University, and early turned his attention to geology. He accompanied Sir Charles Lyell when examining the geology of Nova Scotia in 1842. In 1850 he became superintendent of education for Nova Scotia, and in 1855 principal and professor of natural history in McGill College, Montreal, in which position, as well as in that of vice-chancellor, and latterly principal of the university (1855–93), his services in the cause of education were of very great importance. He became a member of the Royal Society (London) in 1862, was knighted in 1885, and was president of the British Association in 1886 during its meeting at Birmingham. His published works include: 'Acadian Geology' (1855); 'Archaia, or Studies of the Narrative of Creation in Genesis' (1857); 'Agriculture for Schools' (1864); 'Handbook of Canadian Zoology' (1871); 'The Story of Earth and Man' (1872); 'The Origin of the World' (1878); 'The Chain of Life in Geological Time' (1881); 'The Geological History of Plants' (1888); 'Modern Science in Bible Lands' (1888); 'Handbook of Canadian Geology' (1889); 'Modern Ideas of Evolution' (1890); 'The Ice Age in Canada' (1894).

Dawson, Miles Menander, American actuary and author: b. Viroqua, Wis., 13 May 1863. He has published: 'Elements of Life Insurance' (1892); 'American Life Insurance Methods' (1893); 'Assessment Life Insurance' (1895); 'Lessons in Actuarial Science' (1897); 'American Experience' (1900); 'Things Agents Should Know' (1900); etc.

Dawson, William James, English poet, novelist, and clergyman: b. Towcester, Northamptonshire, 21 Nov. 1854. He entered the Wesleyan ministry in 1875 and held various Wesleyan pastorates until 1892, when he became pastor of the Highbury Quadrant Congregational Church, London. His works include: 'Arvalon: a First Poem' (1878); 'A Vision of Souls' (1884); 'Quest and Visions: Essays on Life and Literation' (1886); 'The Threshold of Manhood' (1889); 'The Makers of Modern Poetry' (1890); 'The Redemption of Edward Strahan: a Social Story' (1891); 'Poems and Lyrics' (1893); 'London Idylls' (1895); 'The Comrade-Christ: Sermons' (1894); 'The Story of Hannah' (1896); 'The House of Dreams' (1897); 'Through Lattice Windows' (1897); 'Table Talk With Young Men' (1898); 'Judith Boldero, a Tragic Romance' (1898); 'Makers of Modern Prose' (1899); 'Savonarola: a Drama' (1900); 'The Man Christ Jesus' (1901).

Dawson, Canada, city and capital of Yukon District, Northwest Territories. It is situated on the right bank of the Yukon River, 1500 m. from its mouth, at the confluence of the Klondike River, about 50 m. east of the Alaskan boundary; in lat. about 64° N. and lon. 139° W. The city, which is near the site of old Fort Reliance, has grown up since the discovery of gold on Bonanza Creek, 16 Aug. 1896, and is the receiving and distributing center for the Klondike mining district. It is mostly well built, the two great fires of 1899 having destroyed many of the rude, temporary structures. It has churches, schools, banks, warehouses, hotels, newspapers, telegraph and telephone service, theatres, and an electric light plant. Forty below zero is the average temperature for days at a time, but blizzards are not common. Thawing the ground by steam, the use of automatic lifts and buckets, and of machinery in general, have largely increased the gold output of the region. Coal deposits have been found nearby. Steamers ply upon both the upper and lower Yukon. Dawson has a United States consulate. Pop. (1901) 9,142.

Dax, däks, a town of France, department of Landes, on the left bank of the Adour. It consists of the town proper, surrounded by old ramparts partly Roman, and of a suburb called Sablar, on the opposite side of the river and communicating with it by a bridge. The principal edifices are the high church, once a cathedral, the bishop's palace, now occupied as public offices, the communal college, normal school, assembly-room, handsome thermal establishment, etc. There are various ancient Roman remains. Its chief attraction is its warm sulphur springs, which have temperatures varying from 86° to 166° F., were much frequented by the Romans, and are still in great repute. Its old name was Aquæ Tarbellicæ, and from Aquæ ("waters") comes its modern name. Pop. (1896) 8,307.

Day, Benjamin Franklin, American naval officer: b. Ohio. He was educated at the Naval Academy 1858–61, served in various capacities during the Civil War and became a rear admiral in March 1899, retiring in March 1900.

Day, George Edward, American Hebrew scholar: b. Pittsfield, Mass., 19 March 1815; d. 2 July 1905. He was educated at Yale and the Yale Theological Seminary, and entering the Congregational ministry was successively pastor at Marlborough and Northampton, Mass., 1840–51. He was professor of biblical literature at Lane Theological Seminary, Cincinnati, 1851–66, and of Hebrew at Yale 1866–95, and professor emeritus from the last named year.

Day, Henry Noble, American educator: b. Washington, Conn., 4 Aug. 1808; d. New Haven, Conn, 12 Jan. 1890. He was a nephew of Jeremiah Day (q.v.) and became professor of sacred rhetoric in Western Reserve College in 1840, and was president of the Ohio Female College in 1854–64. He published: 'The Art of Elocution' (1844); 'The Art of Rhetoric' (1850); 'Elements of Logic' (1867); 'The Science of Æsthetics' (1872); 'The Science of Thought' (1886); 'Elements of Mental Science' (1889).

Day, Holman F., American journalist and poet: b. Vassalboro, Me., 6 Nov. 1865. He was graduated at Colby College in 1887 and entering journalism the year after, has since been editorially connected with various Maine journals. He has contributed extensively to periodicals and is the author of two volumes of popular verse: 'Up in Maine' (1900); 'Pine Tree Ballads' (1902).

Day, Horace H., American manufacturer: b. 1813; d. Manchester, N. H., 23 Aug. 1878. He early entered the rubber industry, but was compelled to retire from it as a result of patent litigations with the Goodyear interests. In 1856 he had begun to advocate the utilization of the water power of Niagara Falls, a project, however, in which he expended large sums without return. He returned to the rubber industry, but ultimately lost his fortune.

Day, James Roscoe, American Methodist clergyman: b. Whitneyville, Md., 17 Oct. 1845. He was graduated from Bowdoin College in 1874, entered the Methodist ministry and was successively pastor in Portland, Boston, and New York. He is at present (1903) chancellor of Syracuse University.

Day, Jeremiah, American educator: b. New Preston, Conn., 3 Aug. 1773; d. New Haven, Conn., 22 Aug. 1867. He was graduated at Yale 1795. Having early made choice of the profession of theology, while acting as tutor he began to preach as a candidate for the ministry; but before taking charge of any parish, was in 1801 elected to the professorship of mathematics in Yale College. In 1817 he became president of the college, continuing in that position till his resignation in 1846. He published: 'An Introduction to Algebra' (1814); 'Navigation and Surveying' (1817); and other works.

Day, John, English dramatist: fl. about 1600. Of his life hardly anything is known. He is mentioned in Henslowe's 'Diary' in 1598 as an active playwright. But few of his earlier works have come down to us save 'The Blind Beggar of Bethnal Green.' Day collaborated freely with contemporary writers, as Chettle and Dekker. Ben Jonson in his conversations with Drummond of Hawthornden grouped him with some other admirable gentlemen and authors as a rogue and a base fellow. His best works that have reached us are a graceful comedy, 'Humor out of Breath'; and 'The Parliament of Bees,' a kind of allegorical masque in which all the characters are bees. "The very air," says Charles Lamb, "seems replete with humming and buzzing melodies. Surely bees were never so berhymed before." An edition of Day's works was privately printed by A. H. Bullen in 1881.

Day, Lewis Foreman, English decorative artist: b. London 1845. He was trained in the workshops of Clayton and Bell and for 30 years has designed wall decorations, textiles, glass, and various other manufactures connected with ornament. He has lectured on art topics frequently at the South Kensington Art Museum, and is the author of 'Principles of Everyday Art'; 'Nature in Ornament'; 'Stained Glass Windows'; 'Art in Needlework'; 'Alphabets Old and New' 'Lettering in Ornament'; 'Text Books of Ornamental Design' (4 vols.).

Day, Richard Edwin, American journalist and poet: b. West Granby, Oswego County, N. Y., 27 April 1852. He was educated at Syracuse University and was on the editorial staff of the Syracuse *Standard* 18 years. He has published: 'Lines in the Sand' (1878); 'Thor: a Drama' (1880); 'Lyrics and Satires' (1883); 'Poems' (1888).

Day, or **Daye, Stephen,** American colonial printer: b. London about 1610; d. Cambridge, Mass., 22 Dec. 1668. He was employed by the Rev. Joseph Glover to accompany him to America in 1638, to operate a printing press which he was going to set up in Massachusetts. Mr. Glover died on the voyage and the press was placed in the house of Rev. Henry Dunster, first president of Harvard College. The first book printed in the colonies was issued from it in 1640, and was entitled 'The Whole Booke of Psalmes, faithfully translated into English metre,' commonly styled 'The Bay Psalm Book.' The printing house was taken from him about 1648, and put into the hands of Samuel Green. See Thomas, 'History of Printing in America' (1810).

Day, Thomas, English writer: b. London 22 June 1748; d. 28 Sept. 1789. He was educated at Oxford, and was called to the bar but never practised. In 1778 he married a Miss Esther Milnes, who was willing to conform to his ascetic requirements. His principles led him to renounce most of the indulgences of a man of fortune that he might bestow his superfluities upon those who wanted necessaries. He wrote, in prose and verse, on various subjects, but his name is kept alive chiefly by the well-known book written for the young, entitled 'History of Sandford and Merton.'

Day, William Rufus, American jurist: b. Ravenna, O., 17 April 1849. He was graduated from the University of Michigan in 1870, and from the law school of the same institution in 1872. In the latter year he was admitted to the Ohio bar, and began the practice of law at Canton, where he soon gained local and state distinction; in 1886 he was elected judge of the common pleas court of the 9th judicial district, being the candidate of both political parties. In 1889, President Harrison appointed him United States district judge for the northern district of Ohio, but he was obliged to decline the appointment on account of ill health. In 1897 he was made assistant secretary of state by his friend, President McKinley, and in April 1898 he succeeded Sherman as secretary of state, as such conducting all the negotiations of the Spanish war. Later in 1898 he resigned the secretaryship, and was appointed chairman of the United States Peace Commission to frame a treaty of peace with Spain, in which capacity he had a conspicuous and responsible part in all peace negotiations. He then returned to his law practice, but in 1899 was appointed to succeed Judge Taft as United States circuit judge, and on 26 Jan. 1903 was appointed to the Supreme Court by President Roosevelt.

Day, a word used with several different senses. Its most ancient meaning is the period of light ("natural day") as opposed to the period of darkness, and in this sense it is still quite commonly used. Its most common application, however, is to the period of light and that of darkness together, but even in this sense there are different days. The sidereal day is the time

that elapses between two successive culminations (see CULMINATION) of any particular fixed star, or, in other words, is the time occupied by a revolution of the earth round its axis. The solar, astronomical, or apparent day is the time that elapses between two successive returns of the same terrestrial meridian to the centre of the sun. This period is not always of the same length, and its mean length gives us the mean solar or civil day. The 24 hours of the sidereal day are numbered in succession from 1 to 24, while the civil day in most countries is divided into two portions of 12 hours each. The abbreviations P.M. and A.M. (the first signifying *post meridiem,* Latin for afternoon; the latter *ante meridiem,* forenoon) are requisite, in consequence of our division of the day into two periods of 12 hours each. In this respect the mode of numbering the hours from 1 to 24 consecutively has an advantage, and in some countries is being introduced; in parts of Italy it has long prevailed. The Babylonians began the day at sunrising; the Jews and Greeks at sunsetting; the Egyptians and Romans at midnight, as do most modern peoples. Astronomers use a day of the same length as the civil, but commonly make it begin at noon and number the hours up to 24, though latterly midnight has been partly adopted as the starting-point.

If we take a day according to the second definition given above (that is, a sidereal day), its length, of course, is the same throughout the year (see SIDEREAL TIME). The solar day, in consequence of the varying rapidity of the earth in its orbit, and the obliquity of the ecliptic, is different at different times (see SOLAR TIME), and this difference is uniform throughout the earth; but the time of the natural day (or period of light) is different at the different points of the earth, according to their distance from the equator. The daily apparent revolution of the sun takes place in circles parallel to the equator. If the equator and the ecliptic coincided, the circle bounding light and darkness would always divide, not merely the equator, but all its parallels, into two equal parts, and the days and nights would be equal in all the parallels through the year; but at the poles there would be no night. Owing to the inclination of the earth's axis to the plane of its orbit (the ecliptic), the parallel of latitude in which the sun appears to move is continually changing; and therefore the equator alone (being a great circle) always remains bisected by the circle dividing light from darkness; so that the days and nights here are always equal; while the parallels of latitude, not being great circles, are not equally divided by the circle separating light from darkness, except at the time of the equinox, when the sun is moving in the equator; and, of course, at this time only are the days and nights equal in those parallels. As you approach the poles the inequality between the days and nights becomes continually greater, till, at the poles themselves, a day of six months alternates with a night of equal duration. The most distant parallel circles which the sun describes north and south from the equator are, as is well known, only 23½° from it. The distance between the polar circles and the poles is the same. Therefore, as a little reflection will show, when the sun is in one of the tropics, all the polar circle in the same hemisphere will be within the illuminated region (because it will be within 90° of the sun) during the whole of a diurnal revolution, while the other polar circle will be in the region of darkness. These circles, therefore, have one day of 24 hours, and one night of the same length in each year. From the polar circles to the poles the time of the longest day increases fast, and in the same measure the length of the longest night. Notwithstanding the inequality of the periods of light and darkness in the different parts of the earth, each portion of the earth's surface has the sun above its horizon every year precisely six months, and below it the same length of time.

A day, in law, includes the whole 24 hours from midnight to midnight. In reckoning periods of time from a certain event, the day on which the event occurred is excluded. On the other hand, if it be required to prove survival for a certain number of days, it will suffice if the person be alive for any portion, however small, of the last day. While an obligation to pay on a certain day would therefore be theoretically discharged by payment before midnight, the law requires that reasonable hours be observed — for example, if the payment (as a bill) is at a bank or place of business, it must be within business hours.

A lawful day is a day on which there is no legal impediment to the execution of a writ — that is, a day may be unlawful, *dies non juridicus,* either by common law, or specific statute. By common law Sunday is a day on which the service of a writ cannot legally be made. Other days have been made holidays by both State and Federal statute in this country, and no such legal holiday is a lawful day.

Day-lily, the popular name for a genus of lilies (*Hemerocallis*), natives of temperate Asia and chiefly of eastern Europe, grown in gardens. They have long radical leaves, and a branched few-flowered scape, with handsome large blossoms, the segments of which are united into a tube. The flowers are found in meadows and along streams throughout the Atlantic seacoast from New Brunswick to Virginia, and west to Ontario and Tennessee. A species with bright yellow flowers (*H. flava*) is sometimes found near old gardens. The name of the genus is from Greek signifying "beautiful for a day." In Europe these plants are sometimes cultivated as fodder for cattle.

Day-Blindness, or **Hemeralopia.** See VISION, DEFECTS OF.

Day of Sections, in French history, 4 Oct. 1795, when the National Guard attacked the Convention in the Tuileries. The forces of the government, under command of Napoleon, disarmed the regiments in the different sections, the first clash occurring in the Rue Saint Honoré.

Dayfly, a name sometimes used for the well-known Mayfly. A neuropterous insect of the family of *Ephemeridæ.* The infant stages of larva and pupa are unusually long, often extending to 10 months; but the adult period is short, and is passed without taking food, and covers only a few hours, never more than a day. In the early summer Mayflies abound in great numbers about northern lakes and rivers, furnishing food for other insects, and for crustaceans and fish.

Days of Grace. The time at which a bill is actually due and payable, except in the case of bills payable on demand or at sight, is three days after the time expressed on the face of it, and these three additional days are called days of grace. In England if the third day of grace falls on a Sunday, Christmas Day, Good Friday, or a national fast or thanksgiving day, the bill is payable the day before. In the United States, a bill or note becoming due on a Sunday or a holiday is payable on the first business day thereafter.

Dayton, Elias, American soldier: b. Elizabethtown, N. J., July 1737; d. there 17 July 1807. He joined the British forces in 1760 which were employed in completing the conquest of Canada from the French; and he subsequently commanded a company of militia, with which he marched on an expedition against the northern Indians. He took part in the important battles of Springfield, Monmouth, Brandywine, Germantown, and Yorktown. After the war he served several terms in the legislature of his native State.

Dayton, John, American colonial governor: b. about 1761; d. Charleston, S. C., 27 Nov. 1822. He held several government offices, was chosen governor of South Carolina in 1800 and again in 1808, and was afterward appointed judge of the United States district court, a position which he held until his death. He published: 'A View of South Carolina,' and 'Memoirs of the Revolution' in that State.

Dayton, Jonathan, LL.D., American statesman: b. Elizabethtown, N. J., 16 Oct. 1760; d. there 9 Oct. 1824. In 1778 he entered the American army as a paymaster. In 1791 he was elected by the Federal party a representative in Congress, in which capacity he served for three successive terms, during the last two of which he was speaker of the House. In 1799 he was elected to the United States Senate.

Dayton, William Lewis, American jurist and statesman: b. Baskingridge, N. J., 17 Feb. 1807; d. Paris 1 Dec. 1864. He was graduated at the college of New Jersey in 1825; and was admitted to the bar of his native State in 1830. In 1838 he was chosen one of the associate justices of the supreme court of New Jersey, which position he resigned in November 1841; and in 1842 was appointed by the governor to fill a vacancy in the United States Senate. At the expiration of his term he resumed the practice of his profession at Trenton; and in 1856 was nominated by the Republican national convention as their candidate for the vice-presidency of the United States, with Fremont as the candidate for President. He was attorney-general of New Jersey 1857–61, and was minister to France 1861–4.

Dayton, Ky., city in Campbell County, on the Ohio River, and the Chesapeake & Ohio Railroad. Some of the manufactures are watch cases, pianos, whiskey; and the public buildings are good churches and schools and the Speers Memorial Hospital. Pop. (1901) 6,203.

Dayton, Ohio, city and county seat of Montgomery county, at the confluence of the Great Miami and Mad Rivers and Stillwater and Wolf creeks. It is on the Erie; the Dayton and Union and the Pittsburg, Cincinnati, Chicago and Saint Louis railroads; 67 miles southwest of Columbus and 60 miles north of Cincinnati. There are 125 trains entering the city daily. The Union Station was opened to the public in July, 1900, and cost including tracks $900,000. The city has an area of 10¾ square miles.

Government.— The Mayor, Treasurer, Auditor, Solicitor, Board of Public Service, of three members, are elected by popular election. The Board of Public Safety, of two members, and the Board of Health are appointed by the Mayor and confirmed by Council. The City Council, composed of 13 members from 10 wards, is elected by popular vote, for two years, each member receiving an annual salary of $250. It is a legislative body only. The supply of water for the city is almost inexhaustible in quantity and of almost absolute purity. In 1904 there were 133 miles of street mains, 1,300 fire hydrants, 15,503 service taps. The Fire Department has a force of 90 men, 14 engine-houses, 50 horses maintained at a cost of $86,728.48 and with property worth $375,000. A complete system of surface and under-ground sewerage, both Storm and sanitary, is provided. In 1904 there were 67.9 miles of Storm sewerage.

Municipal Finances.— On 31 Dec. 1903 the citys financial statement was as follows: Assessed value of taxable property, $47,250,640; real value of taxable property (estimated), $100,000,000; total bonded debt, including this issue, $2,925,000; cash value of sinking funds, $157,000; bonded debt of city (net), $2,768,000; water works bonds included in total debt, $908,000; tax rate per $1,000 valuation, 28.60.

Banks and Banking.— There are seven National Banks and two Savings and Trust Companies. A report of the condition of the National Banks in 1904 showed that the aggregate capital stock was $2,400,000; surplus, $625,000; undivided profit, $561,412.51; with a total of loans and discounts of $7,798,178.75; deposits, $7,580,288.51 and a circulation of $563,700. One of the savings and trust companies has a capital and surplus of $250,000 and the other a capital of $275,000. The Clearing-House reports for 1903 were $86,807,930.41; for 1902, $76,491,771.15. The Internal Revenue receipts for 1903 were $2,617,679.07. Dayton takes rank as foremost in building associations of any city of its size in the country. The large number of the 20,000 or more homes in the city have been built with the aid of these associations. There are 12 associations with an aggregate authorized capital of $49,400,000 and capital assets $13,013,841.11.

Manufacturing Interests.— While Dayton's manufacturing industries are widely diversified and include the manufacture of cash registers, railroad cars, water-wheels, agricultural implements, sewing machines, foundry work, etc., these are conducted on so large a scale that many establishments employ from 500 to 2,500 hands. According to the U. S. census of 1900, the average number of wage-earners in the city was 16,869; the total wages paid was $7,959,792 and the value of the productions was $35,697,695. Great progress was made since 1900 and careful estimates show that in 1903 the average of wage-earners had increased to 20,740 with a total wages paid of $10,180,619 and the value of the products $46,596,875.

Street Railways.— A potent force in the development of the city has been the electric traction lines, of which Dayton has more than any other city in Ohio. There are nine lines, with a total mileage of 385 miles, which radiate in all directions through the populous and rich country of which Dayton forms the center. The city railway lines, three in number, have a total mileage of 70 miles and render excellent service.

Education.— The Dayton public school system has for many years enjoyed the reputation of being one of the best in the West. On 31 Aug. 1903 there were 48 schools, 23 district schools and one High School with 37 teachers and 1,058 pupils and with property valued at $326,252. There is one Normal School with an attendance of 67, 22 Kindergartens with an attendance of 1,058, one Manual Training School with an attendance of 1,710, and one school for the deaf. The total value of school property and equipments was $1,467,387. There are 10 Catholic Parochial Schools with 94 teachers and 3,023 pupils and two Lutheran Parochial Schools with 89 pupils and also three large colleges and seminaries for Catholic youth and four well-attended Business Colleges, one of which, the Miami Commercial College, was established in 1860. The Union Biblical Seminary is the training college of the United Brethren denomination of the United States and a very successful Arts and Crafts Society is doing excellent work. There are 90 churches in the city. Valuable adjuncts to the churches are the Young Men's Christian Association and the Young Woman's Christian Association and the Woman's League and a number of lesser church associations.

Public Library.— Dayton had the first library incorporated in the State, one having been established in 1805. The Public Library was opened in 1855 and is supported by public taxation, having an income of $18,000 per annum. The total number of volumes recorded 1 Jan. 1904 was 63,133. There are five daily newspapers, each with weekly editions, besides 17 church and other publications. There are also three large church publication houses.

Hospitals.— The city hospitals include the Saint Elizabeth Hospital, the Miami Valley Hospital, and the Protestant Hospital which has a large central building known as the Frank Patterson Memorial of Operative Surgery, one of the most complete buildings for its purpose in the United States. The Dayton State Hospital for the insane is maintained by the State. The Hospital of the National Military Home which adjoins the city is the largest military hospital in the world and has an average of 600 patients, all of whom are Veteran Volunteer Soldiers of the Civil and Cuban War.

History.— The town was laid out in November 1795 by Gen. Israel Ludlow and was named after Gen. Jonathan Dayton. The first settlers arrived in the spring of 1796. Situated in the Miami Valley, one of the most fertile valleys in the United States, producing for many years great crops of corn, wheat, tobacco and numerous cattle, sheep and horses and with abundant water power to develop its industries, Dayton has grown to be the third largest manufacturing city in the State. With its industries so diversified, its banks and building associations so strong and uniformly successful and with its people so well educated, it is one of the richest and most prosperous communities in the Union.

Population.—(1880) 38,678; (1890) 61,229; (1900) 85,333; (1904), estimated, 100,000.

A. D. Wilt,
President Miami Commercial College.

Dayton, Tenn., city and county-seat of Rhea County; on the Cincinnati, New Orleans & Texas Pacific Railroad; about 75 miles southwest of Knoxville. It is in the centre of a coal-mining district; and iron, machinery, lumber, bricks, and flour are the chief manufactures. Pop. 2,120.

Dayton, Wash., city and county-seat of Columbia County; on the Touchet River, and the Washington & Columbia River, and the Oregon railroads. It is about 28 miles, in direct line, northeast of Walla Walla and 50 miles southwest of Colfax. It is situated in one of the best agricultural regions of the State, and its trade is largely in agricultural products and cattle. It contains stores, large flouring-mills, and well-built churches and schools. Pop. 2,300.

Daza, dä'zä, **Hilarion,** Bolivian general and ex-president: b. Sucre 1840; d. 28 Feb. 1894. In 1857 he enlisted as a soldier in the famous battalion of Col. Balsa, and was rapidly promoted. On 24 Nov. 1870, by an act of treachery he deprived President Melgarejo of office, and defeated him in an engagement 15 Jan. 1871. After that he was practically the arbiter of the destinies of the country for several years. By the *coup d'etat* of 4 May 1876 he became president in place of Frias. The army deposed him 27 Dec. 1879. He went to France, but after a few years returned to Bolivia, and in that country was assassinated.

D'Azeglio. See Azeglio, Massimo Taparelli, Marquis d'.

Deacon (from the Greek *diakonos,* a servant), a person who belongs to an inferior order of ministers in the Christian Church. Seven were apparently first instituted by the apostles (Acts, chap. vi.), which number was retained a long time in several churches.

In the Roman Catholic Church, a sacred minister whose functions are to assist the priest in the liturgical service and in the administration of the sacraments; also in emergencies to baptize, to preach, and to administer the Eucharist. These three functions it is not lawful for the deacon to discharge without express authority from the bishop save in case of necessity. But in the first ages of the Church it was the deacon that gave the communion, in both species, to the faithful in the public liturgical service and at their homes in case of sickness. In the present usage of the Church the diaconate is, save in exceptional cases, simply a step toward the priestly state and office and for the deacon as such there is no recognized place in the economy of the Church.

In the English Church, also, the diaconate is merely a step toward the priesthood, and the deacon's duties are all in the way of assisting the priest. He preaches only by episcopal permission, and he cannot consecrate the elements

of the Lord's Supper, or pronounce the absolution. No person can be ordained deacon before he is 23 years old, except by dispensation from the archbishop of Canterbury. The office of deacon in other churches varies considerably, and some, of course, have no functionaries bearing this name.

In the Methodist Episcopal churches, the junior order of the priesthood, the novitiate being first ordained a deacon, and then after a time, if satisfactory conditions have been fulfilled — such as progress in grace and gifts, and the probation of character — elevated to the full priesthood or eldership — the latter the highest order in the Church — the bishops occupying not a superior ecclesiastical order, but holding a merely supervisory office.

In the Presbyterian churches, the orders here are teaching elders, or ministers, ruling elders, generally called simply elders (these two orders looking over the spiritual affairs of the congregation); and deacons (now gradually being displaced in many places by managers), to attend to the more secular matters.

In the Congregational, Baptist, and other churches, deacons are spiritual officers ranking immediately after the minister, and looking after both the spiritual and the temporal concerns of the congregations.

Deaconesses, in the time of the apostles, were usually widows who assisted in the solemn baptism of women (by immersion), instructed female catechumens in the doctrines and usages of the Church, visited those of their sex who were sick or were in prison for the faith's sake, dispensed the alms of the faithful, and kept order in the women's part of the assembly room during the liturgical service. That the deaconesses were in the earliest times widows, and not maids or married women, appears from the curious fact that Saint Ignatius, disciple of St. John the evangelist, speaks of "virgins who are called widows"; as clear a proof of the original custom of choosing widows only to be deaconesses, as would be the formal declaration that such custom existed. For a long time it was required that the deaconesses should be not less than 60 years old; by the councils of Chalcedon and in Trullo the age of 45 years was made the minimum; by the Council of Chalcedon deaconesses were forbidden to marry; and no widow who had married a second time was ever admitted to the rank of deaconess. The institution of deaconesses was extinct in the western Church in the 10th century and in the Greek Church in the 12th; but it survives in churches of the Syrian rites.

The work done by the deaconesses in the early centuries is performed now, in the Roman Catholic, and in many of the Protestant Episcopal, churches by the nuns (see SISTERS). In the 19th century the order of deaconesses was revised in several of the Protestant churches. Theodore Fliedner (1836) of the United Evangelical Church of Prussia, founded a home for deaconesses, in Kaiserswörth, Prussia. Germany has several homes, and in 1855 the order was established in Baltimore, Md.

Dead, in nautical language, a word frequently employed as part of a designation or phrase having, in general, a meaning somewhat opposite to that of active, effective, or real. The chief of such phrases are the following: Deadeyes: circular, flattened wooden blocks, without sheaves, and having eyes for lanyards, which form a purchase or tackle whereby the shrouds or other parts of fixed rigging are extended or set-up taut; dead-flat: the name for one of the midship-timbers; dead-lights: strong wooden shutters used to close cabin windows, on the approach of a storm, to protect the glass; dead-ropes: such as do not run in blocks; dead-wood: the term applied to the solid blocks of timber erected upon the keel throughout the sharp portions of a ship's hull at stem and stern, the chief object being to give solidity and strength to the ends of the ship.

Dead, Book of the, a name given to the great funerary work of the ancient Egyptians, who themselves entitled it 'Per-em-Hru,' "to go north from (or by) day." It is a collection of prayers and exorcisms composed at various periods for the benefit of the pilgrim-soul in his journey through Amenti (the Egyptian Hades); and it was in order to provide him with a safe conduct through the perils of that terrible valley that copies of the work, or portions of it, were buried with the mummy in his tomb. Such copies, hieroglyphic or hieratic, according to the age when they were executed, and made some to order, others for sale, constitute fully one half of the thousands of extant papyri. They are mostly corrupt and faulty in language. See BOOK OF THE DEAD.

Dead, Disposal of the. In every age and in all countries, the living have shown their respect for the dead by various modes of burial ceremony, and the religion and laws of all countries reflect in large measure this feeling of reverence for the memory of those who have gone before. The methods of disposal of the dead are many, and historic romance has preserved for us many interesting and pretty customs. In the main, however, three methods are largely employed by modern peoples — burial, embalming or its modifications, or cremation with its modifications. It is impossible to tell which method has the greatest antiquity, but probably simple burial antedated the others, since cremation and embalming usually imply a complex religious development. The Hebrews, the Greeks, and the Romans in the main, buried their dead, their burying-grounds having been located outside of town-walls; but cremation also was largely practised by the Greeks, and it has been thought that the Hebrews at one time likewise burned their dead. As is well known, embalming was widely customary among most of the nations of antiquity, although the Egyptians may be said to have been the foremost of those employing it.

The argument in favor of cremation is based principally on sanitary grounds, and despite the general sentiment against it, cremation has made considerable progress in the United States and other countries. There are crematories in many of the leading cities of America, and while much of the feeling against cremation has undoubtedly passed away, there is still great general dislike to burning of the dead.

Apart from methods of antiquity, the problem of disposing of the dead with least danger to the living is, from the medical point of view,

one of great interest. Its discussion is by no means of recent origin, however, for the early Italians, French, and English contributed learned treatises on the subject. It would seem that from the scientific point of view most of the modern writers and those of the Middle Ages strongly favor cremation as one of the cleanest and most efficient modes of disposal of the dead, and it is a matter of history how the ancient Etruscans and others had their burial urns in which to keep the ashes of their forebears.

The now universal method of burial beneath the ground is condemned by practically all sanitarians, but it will probably be many generations before the custom is abandoned, if indeed it is ever to be given up.

As to actual dangers that may arise from dead bodies buried beneath the ground, it cannot be claimed that these are imminent. Disease is mainly transmitted from the living person, and now that we have more definite knowledge of factors involved in the transmission of disease, the bogy of danger arising from burial has little terror for us. It can hardly be claimed with much show of justification that such a water-born disease as typhoid can originate from the water that may percolate through the ground in cemeteries and ultimately reach a potable supply. This danger is theoretical rather than practical, and the amount of time spent in devising methods to prevent such contamination would be much more rationally employed in taking care of the excreta of the living. The contamination of the earth, the air, and the water is, therefore, really of secondary importance; yet it cannot be denied that, excepting some exclusive cemeteries the present methods of burial are disgusting; and in times of war or pestilence not only is burial disagreeable, but there is no doubt that contagion may arise from it, and hence special portable crematories have an undeniable place. See CREMATION.

Dead-letter Office. See POST AND POSTAGE.

Dead-lights. See DEAD.

Dead-men's-fingers, an English fishermen's name for the *Alcyonium,* a genus of polyps, the typical one of the family *Alcyonidæ,* characterized by the polyps of the colony having eight hollow arms and eight mesenteries, and a skeleton composed of separate calcareous spicules. It contains many well-known species, such as *A. digitatum,* or sea-finger (dead-men's-fingers, known also to fishermen as dead-men's-toes, and cow's-paps), and *A. glomeratum.* A common species on the United States Atlantic coast is *A. carneum.* The name is also applied to certain species of branching sponges.

Dead-nettle, a common name applied to the genus *Lamium* of the natural order *Labiatæ,* mint family. It is an annual or perennial herb, of which there are about 40 species, all natives of the Old World. It has been naturalized in America, and several species are found in waste places and cultivated ground from New Brunswick to Florida and west to Ontario, Minnesota, and Arkansas. The best-known species are *L. purpureum* and *L. album,* which are used in the northern parts of Europe as pot-herbs. A species of the genus *Galeopsis* (*G. tetrahit*) is called dead-nettle, as is one of the species of *Stachys* (*S. palustris*). It was an old belief that the hairs of the dead-nettle, when dry, caused irritation to the exposed parts of persons coming in contact with the plant, and that this, extending through the system, sometimes caused death; hence the name.

Dead Reckoning. See DEAD.

Dead Sea, the usual name given to a most remarkable lake in the southeast of Palestine, called in the Old Testament "The Salt Sea," "Sea of the Plain," or "East Sea"; by Josephus, "Lacus Asphaltites"; and by the Arabs now, *Bahr-Lût,* "Sea of Lot." It is 46 miles long, with a breadth of from 5 to 9 miles. Its surface, which is lower than that of any water known, is 1,292 feet below the level of the Mediterranean. The depth of the greater part of the northern section is about 1,300 feet; but at the south end the water is only from 3 to 12 feet deep. The shape is that of an elongated oval, interrupted by a promontory which projects into it from the southeast. The Dead Sea is fed by the Jordan from the north and by many other streams, but has no apparent outlet, its superfluous water being supposed to be entirely carried off by evaporation. Along the eastern and western borders of the Dead Sea there are lines of bold, and in some cases perpendicular, cliffs rising in general to an elevation of 1,500 feet on the west and 2,500 feet on the east. These cliffs are chiefly composed of limestone, and are destitute of vegetation except in the ravines traversed by fresh water streamlets. The northern shores of the lake form an extensive and desolate muddy flat, marked by the blackened trunks and branches of trees, strewn about and encrusted with salt. The southern shore is low, level, and marshy, desolate, and dreary. On this shore is the remarkable ridge of rock-salt, 7 miles long and 300 feet high, called Khashm Usdom (Ridge of Sodom). Lava-beds, pumice-stone, warm springs, sulphur, and volcanic slag suggest the presence here of volcanic agencies at some period; but some modern geologists declare that no active volcanoes have ever existed in this vicinity; and that the subsidence of the Jordan Valley occurred in the Tertiary Period. On the other hand it is claimed by modern travelers that the neighborhood of the Dead Sea is frequently visited by earthquakes, and the lake still occasionally casts up to its surface large masses of asphalt. The long-entertained belief that the exhalations from this lake were fatal is not founded upon fact. Within the thickets of tamarisk and oleander which here and there may be seen upon its brink, the birds sing sweetly, and they fly over and swim about on its surface; but the salinity of the waters is adverse to life, though some lower organizations are found in them.

The water of the Dead Sea is characterized by the presence of a large quantity of magnesian and soda salts. Its specific gravity ranges from 1172 to 1227 (pure water being 1000). The proportion of saline matter is so great that, while sea-water contains only 3.5 per cent of salts, the water of the Dead Sea contains upward of 26 per cent, or more than eight times as much as that of the ocean. In all lakes or collections of water without any outflow, the water acquires an infusion of salt, its feeders constantly bringing in this material, while none can go off by evaporation, even when the shores do not as here abound in salt and nitre. The evaporation is great as the heat is intense, and the sea rather contracts than increases. Rain hardly ever falls;

the water is nearly as blue and clear as that of the Mediterranean; and though its taste is horribly salt and fetid, a bath in it is refreshing. Owing to the great specific gravity of the water, it is almost impossible for the bather to sink in it, strive as he may. Several of those who have navigated and explored the sea have fallen victims to a fatal fever. For the story of the 'Cities of the Plain,' see Gen. xix.; but according to Capt. Conder, "it is now generally agreed that the Dead Sea and Jordan were formed by a great fault or crack in the earth's surface long before the creation of man, and that the district presents in our own days much the same aspect as in the days of Abraham. It is vain, therefore, to suppose that the 'Cities of the Plain' were beneath the present sea, though this view was held as early as the time of Josephus." Steamboats are now in use on this lake.

Deadly Nightshade. See BELLADONNA.

Deadwood, S. D., city, county-seat of Lawrence County; on the Fremont, Elkhorn & Missouri Valley, and the Burlington & Missouri River railroads. It is one of the principal trade centres for the mining camps of the Black Hills. A considerable amount of the gold, silver, lead, and other valuable minerals found in the Black Hills is brought to Deadwood for smelting, refining, or reshipment. Besides the large smelter and the cyanide reduction works, there are manufactories for mining implements and machinery, brick, and planing-mills. The Masonic Temple is a large building. The first permanent settlement was made in 1876. Pop. 3,524.

Deaf-mutes, persons both deaf and dumb, the dumbness resulting from the deafness which has either existed from birth or from a very early period of life. Such persons are unable to speak because they have not the guidance of the sense of hearing to enable them to imitate sounds. Most deaf and dumb persons can hear some sounds, and some can distinguish a difference of pitch who perceive no difference in articulations.

The Eustachian tube extends from the tympanum into the throat; and sometimes sounds are better distinguished by opening the mouth when the external opening only is obstructed, hence the habit of "listening with the mouth open." Deafness occurs in every degree, from that which merely impairs the accuracy of the ear in distinguishing faint or similar sounds to that state in which there is no more sensation in this organ than in any other; and sound is felt in almost every part of the body as a mere vibration. Among the causes assigned for congenital deafness are consanguineous marriages, hereditary transmission, scrofula, certain local or climatic conditions, ill-health of the mother during pregnancy, etc. Though mere consanguinity can hardly be regarded as of itself a cause of this defect, yet it is an established fact that a great proportion of the deaf and dumb are the offspring of consanguineous marriages, especially of marriages between first cousins. Deafness is frequently a family trait, though it has been shown that the defect comparatively seldom descends directly from parent to child, though present in various collateral members of the family. For the causes of acquired or accidental deafness, see DEAFNESS. Where partial or complete dumbness occurs and the sense of hearing is perfect, it will often be found to have its origin either in extreme nervous debility or in some mental derangement, and not in defective organs of speech, which in those deaf from birth are almost without exception in their normal condition. In the greater proportion of deaf-mutes no defect is visible, or can be detected by anatomical examination. The necessity of communication, and the want of words, oblige the deaf-mute to observe and imitate the actions and expressions which accompany various states of mind and of feeling, to indicate objects by their appearance and use, and persons by some peculiar mark, and to describe their actions by direct imitation. In this way there is formed a natural sign language. This language, when employed by an insulated deaf-mute, will usually exhibit only the objects of the first necessity and the most common impulses, like the language of a savage tribe. When his ideas expand from age or observation he will find new modes of expressing them; and when his education is begun an intelligent deaf-mute will often express ideas in this language for which it is difficult to find expression in words. When a number of deaf-mutes are brought together in a single institution, selections and combinations of their various dialects are formed; the best are gradually adopted by all; and a new and more complete form of the language is the result. This process, systematically carried on for years in deaf and dumb institutions at Paris and elsewhere, under the observation and direction of intelligent supervisors, has produced a language capable of expressing all the ideas we convey by articulate sounds with clearness, though not always with equal brevity. This language appears to have remarkably close resemblance to that used by the Indians of North America. (See SIGN LANGUAGE.) The Teutonic race being less disposed to the use of gestures and less ready than certain other peoples of Europe in the acquisition of the sign language, has not been so prompt to adopt it as an auxiliary in the education of deaf-mutes.

In ancient times and even through the Middle Ages it was the generally received opinion that deaf-mutes were not capable of being educated, nevertheless a few exceptional cases have been noted. Aristotle, Pliny, and Lucretius refer to this class of defective persons, and they were held by the code of Justinian as legally incapable of entering into a contract. In ancient Rome two dumb painters attracted considerable attention. About 700 A.D., according to the Venerable Bede, Bishop John of Hagunstaldt (Hexham), taught a deaf-mute to speak. The humanist Agricola (q.v.) speaks of meeting a deaf and dumb man who had learned to write. In the middle of the 16th century, Pasch, a clergyman of Brandenburg, instructed his daughter, a deaf-mute, by means of pictures. The first effort of which we have a distinct account, was made by Pedro de Ponce, a Spanish Benedictine, who instructed three deaf-mutes, of noble families, to write and speak, in 1570. His system appears to have been adopted by a countryman of his, a monk, Juan Pablo Bonet, who, in 1620, published a treatise on the art of instructing the deaf and dumb, accompanied by a manual alphabet. In 1648 John Bulwar, physician, published the earliest work in English on the instruction of the deaf and dumb, entitled 'Philocophus, or The Deafe and Dumbe Man's Friend'; in 1644 he had already

published 'Chirologia, or the Natural Language of the Hand.' This was followed by Dr. W. D. Holder's 'Elements of Speech, an Essay of Inquiry into the Natural Production of Letters; with an Appendix Concerning Persons that are Deaf and Dumb' (1669). George Dalgarno, who was a native of Scotland, published in 1680, 'Didascalocophus,' or 'The Deaf and Dumb Man's Tutor.' To Dr. John Wallis (q.v.) is generally ascribed the merit of having been the first Englishman who succeeded in teaching deaf-mutes. The results of his labors on his first pupil were exhibited before the Royal Society in 1663; and in 1670 an essay of his on this subject was published. Contemporary with these philanthropists in England were Baron F. von Helmont and Dr. John Conrad Amman, in Holland, the latter of whom published in 1690 his celebrated work, 'Surdus Loquens.' Toward the middle of the 18th century various teachers arose in different parts of Europe. In 1743 the practicability of instructing deaf-mutes was first publicly demonstrated in France by Pereira, a Spaniard, before the Academy of Sciences, which gave its testimony to the success of the method. About the same time the Abbé De l'Epée, who devoted his life and fortune to this subject, introduced a system for the instruction of the deaf and dumb, which was taught with great success in the Royal Parisian Institution, and afterward still further developed by his pupil and successor, the Abbé Sicard. In 1778 the first public institution for the education of deaf-mutes was established at Leipsic, through the labors of Samuel Heinicke, the great upholder of the vocal, oral, or articulatory system. His followers admitted the use of the sign language in the early stages of instruction, but sought to banish it as early as possible, considering it as a rude language, incapable of improvement, and which retarded the expansion of the pupil's mind, and rendered it less necessary for him to attend to written language. They believed that no freedom in thought or in expression could be produced without articulation. Although the results of instruction by the French method seemed to disprove these views, yet the pupils of the Abbé de l'Epée and Abbé Sicard have been charged with being very mechanical in their use of signs, and having little power of original thought or sentence construction.

In 1760 Thomas Braidwood established near Edinburgh a deaf and dumb school on the articulating system, which was visited by Dr. Johnson during his tour in Scotland. It was removed in 1783 to Hackney, near London. A day-school for the instruction of deaf-mutes was established by Don Pascal de Pietro at Rome in 1784. The first public institution in Great Britain for the gratuitous education of the deaf and dumb was founded at Bermondsey in 1792 by Townsend and Mason. From this establishment originated the London Asylum in Kent Road, which was opened in 1807. In 1810 a school for affording instruction gratuitously to the dumb was founded in Edinburgh, and others of a similar description were subsequently established at Birmingham, Glasgow, Manchester, and other towns. The method employed most widely in Great Britain was for a considerable time nearly the same as that employed by Sicard in France, but the German oral system was afterward largely adopted, and in 1869 the method of Alexander Mellville Bell was introduced. At the international Congress held at Milan in 1880 the oral system received almost unanimous approval, and its use was adopted in the deaf and dumb institutions of Italy, Germany, Holland, and Austria. The commissioner appointed by the French government to investigate the subject pronounced in favor of the oral method, in 1881; but later a mixed or intermediate method was advised by a congress on the subject. In 1817 the first American asylum for deaf-mutes was founded in Hartford by Thomas Hopkins Gallaudet, who followed a method comprising many of the best features of the Paris school with some others of great importance peculiar to himself. His son, Dr. E. M. Gallaudet, afterwards founded, in Washington, a college for deaf-mutes. The New York Institution was founded in 1818, and the Philadelphia Asylum in 1820. The word institution or school supplanted the term asylum, when the teaching of deaf-mutes became recognized as properly a part of the general work of public instruction coming under the care of the individual States.

The Bell method of teaching deaf-mutes, which is known as the system of "visible speech," is now in extensive use. There is in Boston a training college for instructing teachers in this method. It was introduced into the Clark Institution at Northampton, Mass., in 1872. The characters of the alphabet on which this system is founded are intended to reveal to the eye the position of the vocal organs in the formation of any sound which the human mouth can utter. (See VISIBLE SPEECH.) Alexander Graham Bell (q.v.), son of the originator, and well known for his own scientific inventions, was the first to employ this alphabet in the teaching of deaf-mutes in America. The career of Helen Keller has done much to direct public attention to this method.

Articulation is learned by the deaf-mute as a set of movements and sensations in the organs of speech. It is taught by pointing out to the pupil the positions of the lips, teeth, and tongue, in pronouncing the vowels and consonants by making him feel with his hands all the perceptible movements and vibrations of the throat and other organs which are requisite for their pronunciation and by using diagrams, etc. He is then required to imitate these positions, and to force a quantity of air from the lungs sufficient to produce the sounds, and is taught to read the articulations of others, by observing the position of the organs and the countenance. The facility of doing this will depend much upon the pliability of the organs of speech, and the nature of the language to be learned. Some advocates of articulation believe that, by that portion of the pupils of every institution whose organs are pliable and who have some remnant of hearing (those termed *demisourds* in the Paris school), the acquisition may be made with a degree of ease and perfection which renders it an important branch of instruction for them. But they are equally convinced that to attempt to teach articulation to those entirely destitute of sensibility in the ear, or who cannot exercise the organs of speech without difficulty or pain, is a useless labor, and may produce disease in the pupil.

The sight of deaf-mutes is sometimes so well

trained that they prove very proficient in lip-reading; and if, in addition, their articulation is distinct they can carry on considerable conversation with persons who know nothing of the sign language or of the manual alphabet, cases being known where persons have conversed with the deaf and dumb and remained ignorant that those to whom they were speaking were afflicted in this way.

There are two kinds of manual alphabet, the double-handed alphabet, where the letters are expressed by the disposition of the fingers of both hands; and the single-handed, in which the letters are formed with the fingers of one hand.

Deaf-mute Alphabet. Single Hand.

Deaf-mute Alphabet. Double Hand.

Spelling by the hand is not a part of the sign language but is frequently acquired in addition to the latter and is very commonly used, being an art easily acquired.

In 1903 much interest was aroused by the testing in New York of the acousticon, an instrument devised for enabling the deaf to hear. The inventor, Mr. Hutchinson, had previously exhibited it in England, and the tests in both cases appeared to be remarkably encouraging. The acousticon is a device involving all the important principles of the telephone, with improvements for giving intensity to sound waves. It is in three pieces, which may be carried in the pocket. The one answering to a telephone transmitter is a vulcanized rubber disk about three inches in diameter. To its back is attached a hook by which it may be suspended from a waistcoat pocket. The reverse face of the disk is hollowed and in the hollow certain gases are hermetically sealed. The other two pieces are the earpiece, which corresponds to the receiver of a telephone, and the battery. The latter is about three inches long, two inches wide and half an inch thick. Wires connect the three pieces of the machine. The sound that is to be transferred is caught by the receiver and intensified before it passes to the ears of the subject.

In 1901 Germany led the European states in the number of schools for the deaf, having 98. In France there were 70 such schools, in Great Britain and Ireland 46, in Italy 35, in Austria-Hungary 19, in Norway and Sweden 17, in Switzerland 13, in Russia 13, in Spain 7. There are about 23 other institutions for deaf-mutes in various parts of Europe, and India and Japan have established a few schools. In Canada there are 7, and the United States leads the world with 103 public and 15 private institutions of this nature. Fifty-seven of the public schools are State institutions and 46 are day schools. In the State institutions there were, in 1901, a total of 10,069 pupils. Some are taught by the manual method, others by the purely oral; but the larger number of schools prefer a combined method. Manual training is an important feature in schools for deaf-mutes. There are also six periodicals in the United States devoted to the interests of deaf-mute instruction. The proportion of deaf-mutes in the United States is 1 to 2,400. There were on 1 June 1890 a total of 121,178 deaf persons, of whom 40,592 were deaf-mutes, and 80,611 were able to speak. See DEFECTIVES, EDUCATION OF.

C.), 'The Difference Between the Two Systems of Teaching Deaf-Mute Children' (1898); Peet, 'The Family Instruction of the Deaf'; 'Reports of American Institutions for the Deaf.'

Deaf-mutes, Teaching Speech to. The fact that deaf-born infants make the same babbling efforts to talk as hearing ones and also the fact that a few mothers by giving them the same repetition through their eyes, of the beginnings and progress of language, as they gave their hearing children through their ears, resulting in these deaf children acquiring articulate language and the ability to understand the spoken language of others, induced Emma and Mary S. Garrett to make the experiment of applying this same treatment to the deaf in general.

The experiment began 2 Feb. 1892, as a private effort, with 11 deaf children in a little old building in West Philadelphia, Pennsylvania. In July 1893 it became a State Institution under the title of Home for the Training in Speech of Deaf Children before they are of School Age, and between then and now two large cottages have been erected at Belmont and Monument Avenues, Philadelphia, Pa., on the confines of the Park, each capable of holding 30 children and both of which are constantly filled.

Deaf children are received between the ages of two and eight, the nearer the minimum age the better. Their training is made to conform as nearly as possible to the proper training of normal children. Their lack of hearing every word spoken in their presence, which is the way hearing children learn language, is supplied by intelligently giving them enough repetition of ordinary language through the eye to equal this. Except for this, their training is identical with that of normal children. No signs or motions are ever used to convey ideas to their brains; articulate speech alone is used. There are no vacations as there is no break in the summer in the acquirement of language by hearing children. The results are that all children who have *completed* the training are attending ordinary schools with hearing children; the only special thing required for them being a seat where they can see the teacher's face. Deaf boys, who after completing their preparatory training in the Home have been several years in public schools for hearing children, are learning their trades among hearing people among whom they must ply them. Reports from teachers and employers alike confirm the ability of these children to keep abreast of their classes in school and their fellow workmen in the shops.

These results would not be possible with deaf children deprived of any part of the opportunities which all hearing children enjoy for the development of the powers which they possess in common, nor can any better medium for this be devised than the natural one of articulate speech and language. These are also the medium of communication in the hearing world in which they must pass their lives, and a knowledge of them is indispensable to their usefulness and happiness.

There is no reason physical or mental for depriving deaf infants of learning articulate speech and language at the natural age and they evidence their aptitude to acquire them by babbling in earliest infancy just as hearing babies do.

MARY S. GARRETT,
Principal and Founder of Home for the Training in Speech of Deaf Children before they are of School Age, Belmont and Monument Avenues, Philadelphia, Pennsylvania.

Deafness, a condition in which there is loss of hearing, partial or complete, due to disturbance or destruction of some part of the hearing apparatus, either external or internal. Deafness may be acquired during life, or may be congenital. In most cases of congenital deafness, deaf-mutism results. (See DEAF-MUTES.) Of the acquired forms of deafness, those resulting from disease and destruction of some portion of the middle ear are the most common. Otitis media (q.v.), the commonest cause, may occur at all ages, and is a very frequent accompaniment of some of the acute infectious diseases, particularly measles, scarlet fever, and influenza. In these there is an inflammation in the nose and pharynx. The inflammation ascends the Eustachian tube and, being accompanied by some of the ordinary pus micro-organisms, notably the *Staphylococcus pyogenes aureus*, causes the formation of an abscess in the middle ear. This gives rise to severe earache, and finally to rupture of the drum and discharge of the pus. In many such cases recovery is complete, but in others there is partial destruction of the small bones of the conducting apparatus or even more important structures, resulting in partial or complete deafness. In the aged, chronic inflammation of the middle ear from nasopharyngeal catarrh is perhaps the most common cause of deafness. The middle ear contributes nearly three fourths of all cases of deafness, the external ear a little less than a quarter and the internal ear a very minute remainder.

Deak, dā-äk', **Ferencz,** Hungarian statesman: b. Söjtör, Zala, Hungary, 17 Oct. 1803; d. Budapest 29 Jan. 1876. Having studied law at Raab, he practised for some time as a barrister, but his political career began with his election to the National Diet in 1832. He soon became, in spite of his loyalist and conservative tendencies, a prominent member of the liberal opposition. At the revolution of 1848 he became minister of justice, but retired when Kossuth obtained power. On the defeat of the patriots in 1849 he retired from public office and did not return till the Franco-Austrian war gave him an opportunity of serving his country. He is regarded as the master-spirit of the movement by which the independence of his country was restored in 1867.

Deakin, Alfred, Australian cabinet officer: b. near Melbourne, Victoria, 3 Aug. 1856. He was educated at Melbourne University; was minister of public works and water supply, 1883–6; solicitor-general 1885; chief secretary 1886–90; member of federal council 1889–95–97–99; attorney-general of the commonwealth of Australia 1901–3; and Prime Minister and Minister for External Affairs 1903–4 and again since 1905. He represented West Bourke in Legislative Assembly 1879–89; and Essendon and Flemington until inauguration of Commonwealth Parliament and since 1901 has represented Ballarat in that body. He has published 'Irrigation in Western America' (1885); 'Irrigation in Egypt and Italy' (1887); 'Irrigated India' (1892); 'Irrigation in Australia' (1893); 'Temple and Tomb' (1894).

Deal, in the United States, a plank 12 feet long, 11 inches wide, and 2½ inches thick. Deals are sawed of other sizes, but are reduced to that cubic dimension in computing them. The name deal is applied in Europe to boards of fir above 7 inches in width and of various lengths exceeding 6 feet. If 7 inches or less wide they are

called battens, and when under 6 feet long they are called deal-ends. The usual thickness is 3 inches, and width 9 inches. The standard size, to which other sizes may be reduced, is 1½ inch thick, 11 inches broad, and 12 feet long. Whole deal is deal which is 1½ inch thick; slit deal, half that thickness. Deals are exported from many parts of Europe and the American continent. In the timber trade 50 cubic feet of deals are a load, and 100 feet superficial are a square.

Dealfish, deep-sea bony fishes of the family *Trachypteridæ,* allied to the oar-fish and the ribbon-fish (qq.v.). As the name suggests, the elongated body is laterally compressed, and with the exception of a small separate elevated anterior portion, the dorsal fin is continuous along the back. The anal fin is absent. The tail-fin is peculiar in being sharply turned upward. The skeleton is very fragile. Some eight species are known from specimens accidentally thrown ashore on European coasts and from the west of South America.

De Amicis, Edmondo. See AMICIS, EDMONDO DE.

Dean, Amos, American jurist: b. Barnard, Vt., 16 Jan. 1803; d. Albany, N. Y., 26 Jan. 1868. He early acquired eminence in his profession and after being professor of medical jurisprudence in the Albany Medical School and of law in the Albany Law School, became chancellor of the University of Iowa in 1855. Among his published works are: 'Lectures on Phrenology'; 'Manual of Law' (1838); 'Medical Jurisprudence' (1854); 'Bryant and Stratton's Commercial Law' (1861).

Dean, John Ward, American genealogist: b. Wiscasset, Maine, 13 March 1815; d. Medford, Mass., 22 Jan. 1902. He was educated in the public schools of Portland, Maine, learned the bookbinding trade and conducted a bookbinding business in Boston for many years, till his appointment in 1872 as librarian of the New England Historic Genealogical Society. Save from 1889 to 1893 he filled this position until his death. He was editor of the 'New England Historical and Genealogical Register,' and of nine volumes of the 'New England Bibliopolist' 1880–98. Among his writings are numerous biographical memoirs, including the 'Memoir of Nathaniel Ward' (1868); 'Memoir of Michael Wigglesworth' (1871); and the 'Story of the Embarkation of Cromwell and his Friends for New England.'

Dean, in ecclesiastical language, a church dignitary presiding over the chapter of a cathedral. The word is from the French *doyen* and from the Latin *decanus,* one set over 10 (Gr. *deka,* Lat. *decem,* 10). Originally *decanus* was the designation of a petty civil functionary: its ecclesiastical use had its rise in monachism, where a *decanus* was named to be chief and monitor of 10 monks or 10 hermits; and the senior *decanus* of a *cœnobium* served as head of the monastic community in the absence of the abbot. From the institution of canons regular, serving in the chapters of cathedral churches, came the usage of naming the chief among the canons of a chapter as its dean. Rural deans are parish priests who, appointed by the bishop, exercise a certain jurisdiction and supervision over the churches or congregations and their rectors within a definite district in a diocese. In the Curia Romana, the dignitary styled Cardinal Dean of the Sacred College is the chief among the cardinals and is usually the oldest of the seven cardinal bishops: he succeeds his predecessor in the see of Ostia. From ecclesiastical usage the term dean was adopted as designation of the leading member of various secular bodies, for example, the head of a university faculty, or a college, or of a guild.

In the Church of England some of the deaneries are valuable benefices. A dean may hold one other living along with his deanery. He is bound to reside eight months of the year at his cathedral. The Bishop of London holds the honorary office of dean of the chapel royal, and there is also a sub-dean and chaplains. Rural deans are beneficed clergymen appointed by the bishop or archdeacon to exercise jurisdiction in certain matters in some part of the diocese. This office had fallen into disuse, being superseded by the appointment of archdeacons, but has latterly been revived. The rural deans hold office during the life of those by whom they are appointed. There are also a few deans called deans of peculiars, who exercise an independent jurisdiction, and are not under a bishop. Deans of colleges are, in English universities, officers appointed to superintend the behavior of the members, and to enforce discipline. In the universities of Scotland and elsewhere the head of each of the faculties of law, theology, medicine, science, etc., is called dean of the faculty. The dean of guild in Scotland is a burgh official whose duty it is to see that buildings are erected in accordance with the municipal regulations. In Scotland the honorary title of dean of the chapel royal is bestowed on a clergyman of the Established Church, and six chaplains are also appointed to a similar honorary office. In universities in the United States the dean of a department is the registrar or secretary, and in some institutions he has considerable to do with the discipline.

Deane, Charles, American antiquarian: b. Biddeford, Me., 10 Nov. 1813; d. Cambridge, Mass., 13 Nov. 1889. He was for many years a merchant in Boston but retired from business in 1864 and devoted himself to the collection of works relating to American history. He edited 'Bradford's History of Plymouth Plantation' (1856); 'Wingfield's Discourse of Virginia' (1860), etc.

Deane, Silas, American diplomatist: b. Groton, Conn., 24 Dec. 1737; d. Deal, England, 23 Aug. 1789. He was graduated at Yale College in 1758, and was a member of the first Continental Congress in 1774. He was sent by Congress to France as a political and financial agent, with instructions to ascertain the temper of the French government concerning the rupture with Great Britain, and to obtain supplies of military stores. But he did not confine himself to his instructions, but made promises and engagements on all sides, which afterward brought the Congress into considerable embarrassment. When it was determined to send ministers to negotiate treaties, Dr. Franklin and Arthur Lee were commissioned to join him at Paris, and he assisted in the negotiation of the treaty with France. In consequence of the extravagant contracts he had entered into, he was recalled 21 Nov. 1777, and John Adams appointed in his place. He left Paris 1 April 1778, and upon his return, being called upon to give an account of

his proceedings on the floor of Congress, evaded a complete disclosure upon the ground that his papers were in Europe. He then attacked his fellow commissioners and Congress itself in a public manifesto for the manner in which he had been treated, but did not succeed in removing the public suspicion from himself. He afterward published in 1784 'An Address to the Free and Independent Citizens of the United States' on the same subject, and returning to Europe, died in great poverty. See 'Papers in Relation to the Case of Silas Deane' (1855).

Deans, Jeanie, the heroine of Sir Walter Scott's tale, 'The Heart of Midlothian.' When her sister Effie was sentenced to death for the murder of her own child, Jeanie went on foot to London and obtained from the queen a pardon for her sister. Her devotion forms a contrast to the attitude of the father, David Deans, whose rigid sense of justice leads him, in spite of the dictates of his heart, to drive Effie from his door. Effie is married to her lover and becomes a lady of the court.

Dearborn, Henry, American soldier: b. Hampton, N. H., March 1751; d. Roxbury, Mass., 6 June 1829. He was practising medicine at Portsmouth when, on hearing the news of the battle of Lexington, 20 April 1775, he immediately marched with 60 volunteers, and was at Cambridge early the next day, a distance of 65 miles. He was made a captain, was at the battle of Bunker Hill 17 June, and accompanied Arnold on the expedition through the woods of Maine to Quebec. He served as major under Gates at the capture of Burgoyne, and distinguished himself and his regiment by a gallant charge at the battle of Monmouth in 1778. In 1779 he served in Sullivan's expedition against the Indians, in 1780 with the army of New Jersey, in 1781 at Yorktown, and in 1782 was on garrison duty at Saratoga. He was twice member of Congress, and for eight years, during the presidency of Mr. Jefferson, secretary of war. In 1809 he was made collector of Boston, and on 27 Jan. 1812, became senior major-general in the United States army. Resigning his commission in the army in 1815, he was appointed, 7 May 1822, minister to Portugal, where he remained two years, and was recalled at his own request.

Dearth, Henry Golden, American painter: b. Bristol, R. I., 1863. He studied at the Ecole des Beaux Arts in Paris; and among his works are 'Evening' and 'Autumn.'

Death, in common language, a state opposed to life, and considered as the cessation of it. Strictly speaking, we can trace only the cessation of organic life. The matter of which the body is composed does not perish on the death of an organized being; it undergoes various changes, which are known by the names of decay and putrefaction, and which are the preparation for its becoming subservient to new forms of life. What becomes of the mind, or thinking principle, whether in man or animal, after death, is a matter of philosophical conjecture or religious faith. The investigations of science do not throw the least light upon it. The change here adverted to, which is called death, does not take place so quickly as is generally believed. It is usually preceded and caused by disease or the natural decay of old age. The state called death takes place suddenly only when the heart or the brain is injured in certain parts. Probably the brain and the heart are the parts from which, properly speaking, death proceeds; but as the cessation of their functions is not so obvious as the cessation of the breath, which depends on them, the latter event is generally considered as indicating the moment when death takes place. In the organs of sense and motion the consequences of death first become apparent; the muscles become stiff; coldness and paleness spread over the whole body; the eye loses its brightness, the flesh its elasticity; yet it is not perfectly safe to conclude, from these circumstances, that death has taken place in any given case, because experience shows that there may be from certain causes a state of apparent death, in which all these circumstances may concur without the extinction of the vital spark. The beginning of putrefaction, in ordinary cases, affords the first certain evidence of death. Putrefaction begins in the bowels and genitals, which swell, become soft and loose, and change color; the skin also begins to change, and becomes red in various places; blisters show themselves; the blood becomes more fluid, and discharges itself from the mouth, nose, ears, eyes, and anus. By degrees, also, the other parts are decomposed, and, last of all the teeth and bones. In the beginning of decomposition nitrogen and ammonia are produced: in the progress of it, hydrogen, compounded with carbon, sulphur, and phosphorus, is the prevailing product, which causes an offensive smell, and the light which is sometimes observed about putrefying bodies. At last, only carbonic acid gas is produced, and the putrefying body then smells like earth newly dug. A fat, greasy earth remains, and a slimy soap-like substance, which mixes with the ground, and contributes with the preceding decompositions to the fertility of it. Even in these remains of organized existence organic life is not entirely extinct; and they contribute to produce new vegetable and animal structures. Putrefaction is much influenced by external circumstances, particularly air, heat, and water. When the body is protected from the action of such agents it changes into adipocere (q.v.); but this process requires a much longer time than common putrefaction. In very dry situations the body is converted into a mummy, in which state bodies are found in the arid deserts of Africa, and on the mountains in Peru. Some vaults are remarkable for preserving corpses from putrefaction. It is well known to every reader that particular substances counteract putrefaction; for instance, those used in tanning, and in embalming mummies.

The death-agony is the state which immediately precedes death, and in which life and death are considered as struggling with each other. This state differs according to the cause producing it. Sometimes it is a complete exhaustion; sometimes a violent struggle, and very irregular activity, which at last, after a short pause, terminates in death. In some cases consciousness is extinguished long before death arrives; in other cases it continues during the whole period, and terminates only with life. The person in this condition has already somewhat the appearance of a corpse: the face is pale and sallow, the eyes are sunken, the skin of the forehead is tense, the nose pointed and white, the ears are relaxed, and the temples fallen in; a clammy sweat covers the forehead and the extremities, the alvine discharges and that of the urine take place involuntarily, the respiration becomes rattling, interrupted, and at length ceases

entirely. At this moment death is considered to take place. This state is of very different length; sometimes continuing for minutes only, sometimes for days. When the patient is in this condition nothing should be attempted but to comfort and soothe him. As long as the dying person is able to swallow, wine or other cordials may be given from time to time.

Signs of Death.—During death the larger physical processes, such as respiration and circulation, may first cease, but molecular activity may persist for some time, as is evidenced in the common observation of the growth of hair after death. The desirability of knowing the absolute signs of death is due not so much to the danger of burying the living, as to the possibility that efforts at resuscitation may not be adequately performed in cases of apparent death. The idea that at the present time people can be buried alive is more or less absurd; but it is very true that many cases of apparent asphyxia, notably following drowning or electrical shock, are recoverable if proper means are taken.

There are a number of conditions that simulate death. The commonest of these are catalepsy and trance states, partial asphyxia, and syncope or fainting. In catalepsy there is usually a loss of consciousness, the muscles of the body generally become very rigid, but the limbs may be readily moved and placed in various positions. The temperature is lowered, but the respiration and the heart-action, while reduced, are apparent. In trance the appearance of death is much more striking, consciousness is usually abolished, the face is pale, the limbs may be flaccid, and sometimes are rigid, the reflexes may be lost, and the pupils may be dilated and immobile. The absence of the signs of decomposition, the normal ophthalmoscopic appearance of the fundus of the eye, and the persistence of electrical excitability are sufficient, however, for determining this condition. Partial asphyxia by drowning is one of the most frequent causes of apparent death. Resuscitation has resulted even after a body has been under water for an hour. This fact emphasizes the desirability of continued treatment in all cases of asphyxia by drowning. Ordinary fainting is readily distinguished from normal death.

The special signs of death are those that involve the circulation, respiration, conditions of the muscular system, and certain changes in the eye. Circulatory changes are those of stoppage of the heart, with consequent loss of heat and coagulation of the blood. Careful listening to the heart-sounds by means of specially devised instruments may be necessary to determine whether the heart has stopped beating or not, and special methods of applying ligatures to the lobe of the ear or the finger, cutting off the venous return and permitting the ordinary inflow to continue, may be used. The respiratory changes consist of cessation of respiration, with consequent change in the color of the patient, there being marked pallor in distinction usually to marked cyanosis of asphyxia. A mirror placed before the nose or over the mouth will sometimes detect breathing when it cannot be seen or heard; and if a vessel of water be placed over the chest, movements of that organ may be detected. Muscular changes are very characteristic. There is usually complete muscular relaxation, followed by great stiffness (*rigor mortis*) after a certain number of hours. There is commonly loss of excitability of the muscles. Changes in the eye are corroborative rather than unique. The iris is usually flaccid; the pupil is ordinarily moderately dilated and irresponsive to light, and is not reacted upon by atropine or eserine half an hour after death. There is a marked anæmia of the fundus of the eye when viewed with the ophthalmoscope.

Finally there are a series of cadaveric changes that result and which are indubitable evidence of death. There is gradual loss of heat, although in certain cases of cholera temperatures as low as 76° F. have been observed, and the patient has still lived. *Rigor mortis* develops, probably, by the action of a ferment resulting in the formation of myosin. This condition may come on very rapidly, sometimes in a few hours, but complete *rigor mortis* rarely takes place within this time. Occasionally there is an instantaneous *rigor mortis*, when death occurs suddenly during violent muscular exertion. This happens in times of war, when weapons are sometimes firmly grasped in the dead hand; and in some cases of drowning the patients may be found with weeds and mud clutched in the fingers. The disappearance of *rigor mortis* usually takes place in from 16 to 36 hours, although there is no absolute rule. Coagulation of the blood, post-mortem hypostases, post-mortem lividities, and putrefactive decoloration, with formation of gases, are usually characteristic and unequivocal.

Death in Mythology, etc.— The representation of death among nations in their earlier stages depends upon the ideas which they form of the state of man after this life, and of the disposition of their gods toward mankind. In this respect the study of these representations is very interesting. Of later ages the same cannot be said, because imitations of representations previously adopted are very often the subjects of the plastic arts in such periods. However, these representations do not altogether depend on the causes above mentioned, as the general disposition of a nation (for instance, that of the Greeks, who beautified every object) has also a great influence upon them. The Greeks represented death as a pleasing, gentle being, a beautiful youth. They personified death under the name Thanatos, while the Kēres were rather the goddesses of fate and violent deaths, like the Valkyriæ in the northern mythology. According to Homer, Sleep and Death are twins, and Hesiod calls them the sons of Night. They are often portrayed together on cameos, etc. During the most flourishing period of the arts Death was represented on tombs as a friendly genius with an inverted torch, and holding a wreath in his hand; or as a sleeping child, winged, with an inverted torch resting on his wreath. Sleep was represented in the same manner, except that the torch and wreath were omitted. According to an idea originating in the East, death in the bloom of youth was attributed to the attachment of some particular deity, who snatched his favorite to a better world. It was ascribed, for instance, to Jupiter, or to his eagle, if the death was occasioned by lightning; to the water-nymphs if the individual was drowned, as in the case of Hylas; to Eos or Aurora if the death happened in the morning; to Selene, if at night, etc. These representations were more adapted to relieve the minds of surviving friends than the pictures of horror drawn by later poets and artists. (See Herder's 'Wie die Alten den Tod

gebildet.') Euripides, in his 'Alcestis,' even introduced Death on the stage, in a black robe, with a steel instrument in his hand, to cut off the hair of his victims, and thus devote them to the infernal gods. The later Roman poets represent Death under more horrible forms, gnashing his teeth, and marking his victims with bloody nails, a monster overshadowing whole fields of battle. The Hebrews, likewise, had a fearful angel of death, called Samaël, and prince of the world, and coinciding with the devil; but he removes with a kiss those who die in early youth. The disgusting representations of Death common among Christians originated in the 14th century; for the representation of Death as a skeleton merely covered with skin, on the monument at Cumæ, was only an exception to the figure commonly ascribed to him among the ancients. In recent times Death has again been represented as a beautiful youth — certainly a more Christian image than the skeleton with the scythe. The monument made by Canova, which George IV. erected in honor of the Stuarts in St. Peter's Church at Rome, represents Death as a beautiful youth. He is sometimes portrayed under the figure of a dying lion.

Causes of Death.— There are 15 principal causes of death, with the rate per 100,000, as given by the census bureau. They are as follows: Pneumonia, 191.9; consumption, 191.5; heart disease, 134; diarrhœal diseases, 85.1; kidney diseases, 88.7; apoplexy, 66.6; cancer, 60; old age, 54; bronchitis, 48.3; cholera infantum, 47.8; debility, 45.5; inflammation of brain and meninge, 41.8; diphtheria, 34.4; typhoid, 33.8; and premature birth, 33.7. Death from all principal causes shows a decrease during the last two decades, the most notable instance being that of consumption, which shows a decrease of over 50 per cent per 100,000. The world's death-rate is estimated at 68 a minute, 97,920 a day, and 35,740,800 a year.

Death-adder (*Acanthophis antarcticus*), a very venomous and justly feared snake of Australia, which also occurs throughout the Indo-Malayan Islands to the Moluccas. It belongs to the *Elapidæ*, of which the cobra is also a member, but the death-adder lacks the spreading "hood." The end of the tail is flattened laterally, and is terminated by a horny spine, anterior to which are several rows of enlarged scales which, as well as the habit of elevating and rapidly vibrating this region, does not materially differ from the characteristic rattle of the American rattlesnake.

Death, Civil, formerly the entire loss or forfeiture of civil rights, which followed on attainture for treason or felony. Formerly a man was considered civilly dead who retired into a monastery or abjured the realm. By Act 33 and 34 Vict. cap. xxiii. a conviction for treason or felony no longer causes attainder or forfeiture of civil rights.

Death, Dance of. See DANCE OF DEATH.

Death Duties. See INHERITANCE TAX.

Death-tick, a neuropterous insect of the family *Psocidæ*, of the size and appearance of the common plant-louse, one species of which is a visitor of gardens. Another species is the little book-louse found running over books and feeding on the paper. In England it is called "deathwatch," because there it is said to make a ticking sound like that of the beetle (*Anobium*), thus exciting many superstitious notions. See DEATHWATCH.

Death Valley, a low desert in Inyo County, Cal., near the Nevada border. The name of this region was given by a survivor of an emigrant party of 30 who, in 1849 or 1850, lost their way here, and of whom, after enduring indescribable sufferings, 18 perished in the sands. No other such spot is known. Like all the great valleys of California, it lies oblong from north to south. Its length is about 50 miles; width about 35; surface about 210 feet lower than that of the ocean. The Panamint Mountains shut out from it the moist winds of the Pacific. In the August atmosphere there is less than one half of one per cent of moisture. The surrounding country is made up of volcanic ranges — black, red, green, yellow, and brown — which have furnished the valley with the borax now found there.

On the north of the valley is Ralston Desert, on the west Panamint Desert, on the south Mojave Desert, and Amargosa Desert is on the east. Death Valley has the lowest depression. Summer heat here rises to 137° F. or more, far higher than anywhere else in the Western world. Death Valley, as seen from the summit of the Panamint Range, presents in November a long gray waste desert, in which there are narrow bands of white made by thin deposits of borax; and to the south is seen a thin line like a blade of steel — the Amargosa River, as it dies away upon entering Death Valley sink. It is a sluggish, dead stream, and evaporation and absorption at last take it all.

The land was the centre of a system of lakes when the Sierra Nevada had not yet risen. Toward their summit, the Panamint Mountains are of carboniferous limestone formation, rifted and worn, with a very slight growth of piñon, pine, mahogany, and juniper, near the crests; and below the vegetation becomes more scant. In the gorges and narrow cañons are seen numerous vines and creepers, on which grow wild gourds resembling oranges, also similar to the bitter desert apples that grow near the site of ancient Sodom. Here also are the most distorted forms of the cacti, and an inferior growth of greasewood or palaverde. The wealth of this desert is wholly mineral.

A sand-storm playing in Death Valley is a wonderful sight. Sand-augers rise like slender stems, reaching up into the burning atmosphere for thousands of feet and terminating in a bushy cloud. They travel hither and thither and gradually fade from sight. Here mirage raises up spectral cities, groves, fields, and tree-margined rivers. A low ruin will seem to be hundreds of feet high; arrow-weeds are magnified into stately palms; and crows walking on the ground appear as men on horseback. Besides crows, here are seen a few poor jack-rabbits, mangy coyotes, buzzards, horned toads, red-eyed rattlesnakes, mice and mountain rats; and in the Panamint Range there are still a few bighorns or Rocky Mountain sheep.

At the summit of the Panamint and Funeral mountains, the thermometer at times, it is said, falls to 30° below zero. The mineral wealth of this region is great. In the Panamint Range are many mines of antimonial silver ore, and copper, gold, iron, travertine, onyx, and marble are also found. In the Funeral Range, gold, silver, lead,

copper, and antimony have been found in paying quantities, while the thick strata or measures of the east and southeast hills show almost inexhaustible quantities of colemanite, a borate of lime named for W. T. Coleman, who was one of the first to discover this deposit and find out its richness in borax. Very rich gold quartz has been taken from mines along the route traveled by the ill-fated old emigrant party.

Human society in Death Valley is confined to a few miners in the Funeral, Calico, and Panamint mountains, some few roving bands of Piute Indians, and a few squaw-men owning cattle and horses.

Visitors to Death Valley should not go earlier than 15 October, nor later than 15 April; no one should attempt to cross it while a sandstorm is blowing; a gallon of water is needed for each person in a party, and three gallons for each horse. At present one can go from Dagget on the Atlantic & Pacific Railroad, but the route is little better than from Panamint to Furnace Creek and up through Nevada via Pioche, Nev.

Death's-head Moth, a species (*atropos*) of *Acherontia,* genus of the Sphinx or hawk-moth family, one of the largest of the group, widely distributed over the world, being found in parts of Africa, Asia, and Europe. It is crepuscular in its flight. Its fore wings are blackish-brown, with transverse lines of black and a white spot near the middle. The hind wings are yellow, with black stripes crossing the middle and tracing the margin. Upon the dark thorax is described in pale yellow a mask resembling a man's skull. Hence the common name. The moth is about five inches in extent of wings. The caterpillar is of the same length, of bright yellow color, with violet stripes and a row of blue spots along the back. It is injurious to potato and tomato plants, and in some localities is said to rob beehives of their honey withstanding the attacks of the bees. When frightened or seized, the moth gives forth a squeaking noise. This, with the death's-head, suggests an evil omen to the superstitious, making appropriate the generic name *Acherontia.*

Deathwatch, a small blackish beetle, about a quarter of an inch long, of the genus *Anobium,* common in Europe and America. It receives its ordinary name from the ticking sound which it makes in the woodwork of houses —6 to 12 distinct ticks being produced at regular intervals, like the clicks of a watch. These rappings are caused by the striking of the beetle's head on the hard wood, presumably to attract the attention of its mate. Both the beetle and the larvæ of several species are destructive of books, and are the real bookworms.

Debacle, dā-bä'kl (Fr. *débâcle*), a sudden breaking up of ice in a river; used by geologists for any sudden outbreak of water, hurling before it and dispersing stones and other debris.

Debain, Alexandre Francois, ä-lĕks-ändr frän swä dė-băn, French musical inventor: b. Paris 1809; d. there 3 Dec. 1877. He was a maker of musical instruments and invented the harmonium in 1840.

De Bary, Heinrich Anton, hīn'rĭH än'tōn dā bä'rē, German botanist: b. Frankfort-on-Main 26 Jan. 1831: d. Strasburg 19 Jan. 1888. After a course of medical studies he began in 1853 to practice in his native city, but next year became a *privat-docent* in Tübingen, and the year after was called to be professor of botany at Freiburg, where in 1859 he was appointed ordinary professor. In 1867 he obeyed a call to Halle, and in 1872 to Strasburg, where he was the first rector of the newly reorganized university. As a botanist, De Bary is famous especially for the contributions he has made to our knowledge of the morphology and physiology of the fungi and the Myxomycetæ. Of his numerous works in these departments, the 'Comparative Anatomy of Phanerogams and Ferns' has been translated (1885); as also the 'Morphology of Plants' and 'Lectures on Bacteria' (1888).

Debat-Ponsan, Edouard Bernard, ā-doo-är bär-när dė-bä-pôn-sän, French painter: b. Toulouse 1847. He was a pupil of Cabanel, and although he has produced some noted historical works, is chiefly known as a genre and portrait painter. He won the second grand prize 1872, a medal of the second class 1874, receiving the ribbon of the Legion of Honor 1881, and a bronze medal in 1889. He signed his name Ponsan-Debat until 1880. Among his works are: 'A Story of Philetas' (1870); 'The First Mourning' (1874); 'Jephtha's Daughter' (1876), in the Carcassone museum; 'St. Paul upon the Areopagus' (1877); 'Devotion of St. Louis toward the Dead' (1879); 'A Door of the Louvre on St. Bartholomew's Day' (1880); and portraits of Dr. Pichaud (1874); Paul de Cassagnac (1882); Gen. Boulanger; etc.

Debatable Land, a district of country on the west border of Scotland and England, for a long time a cause of contention between the two countries and a refuge for outlaws.

Debay, Auguste Hyacinthe, French painter and sculptor: b. Nantes 20 April 1804; d. Paris 14 March 1865. He was a son of J. B. J. Debay the elder, and was a pupil of his father and of Gros. He took a medal of the third class 1819 at the age of 15, the second prize of Rome in 1822 with his painting 'Orestes and Pylades'; the first grand prize of Rome with his painting 'Ægisthus Discovering the Body of Clytemnestra,' and a first-class medal in 1831. From 1830 onward he exhibited in all the expositions at Paris, either as painter or sculptor. His principal pictures are: 'The Old Man and His Children'; 'Enlisting at the Place du Palais Royal'; 'The Meeting at the Field of the Cloth of Gold'; 'Attila'; 'Promenade of Sixtus Fifth'; and the 'Battle of Dreux'. As a sculptor he received honorable mention for his 'Napoleon I.' (1841); the first prize in open competition for the monument of Monsignor Affre, now at the Church of Notre Dame, Paris; and a first-class medal at the Exposition 1855 for his best-known work, 'Primitive Cradle'; first shown in 1845. Among other works are statues of Perrault and Claude Lorraine, at the new Louvre; and the marble mausoleum of the Comte and Comtesse de Damas.

Debay, Caroline Louise Emma, French painter: b. Paris 24 March 1809; d. there 6 Sept. 1832. She was a sister-in-law of A. H. Debay (q.v.). Among her works are: 'Christina of Sweden'; 'The Village Bride'; and the 'Young Girl Asleep'.

Debay, Jean Baptiste Joseph, French sculptor: b. Malines, Belgium, 16 Oct. 1779;

PANAMINT MOUNTAINS AND DEATH VALLEY.

d. Paris 14 June 1863. He was first a pupil of the painter Van Biscom, then went to Paris and studied under Chaudet. Summoned to Nantes, he made 30 busts for the library, 10 statues for the Exchange, the frontal of the Hotel de Ville, and the statues of Saints Peter, Paul, and John. Returning to Paris 1817, he made two colossal statues of Neptune and Apollo for Havana; and took a second-class medal with a bust of Talma. Among his works are: a bronze equestrian statute of Louis XIV. at Montpellier; statue of the 'Chancellor of the Hospital,' at Aigueperse; marble statute of 'Mercury putting Argus to Sleep' and 'Mercury Preparing to Slay Argus' at Havana; group of the 'Three Fates'; marble statue of Charles Martel, in the museum at Versailles; marble statue of Colbert; 'Young Woman and Shells,' considered his best work; and the figures of 'Ocean' and 'The Mediterranean' for one of the Place de la Concorde fountains. During his later years he held the position of restorer of sculptures at the Louvre. He received the decoration of the Legion of Honor 1825. He executed numerous portrait-busts in excellent style.

Debay, Jean Baptiste Joseph, French sculptor: b. Nantes 31 Aug. 1802; d. Paris 7 Jan. 1862. He was the eldest son of the preceding. He was a pupil of his father and of Bosio, and went to Havana at 17 years of age to deliver his father's statues. He took the second prize of Rome 1823, with a bas-relief, 'The Grief of Evander,' and in 1829 the first grand prize of Rome with the 'Death of Hyacinth.' He received the decoration of the Legion of Honor in 1851. Among his works are: 'Theseus'; 'Genius of the Sea'; 'Genius of the Hunt'; 'Young Slave,' first-class medal 1836; 'Anne de Bretagne,' Luxembourg Garden; a bronze statue of 'Cambronne' at Nantes; 'Marshal Oudinot' at Bar-le-Duc; 'Modesty and Love,' marble group; equestrian statue of Napoleon III., at Bordeaux; 'Six Apostles,' church of St. Eustache, Paris; and 10 statues for the Pommeraie Gallery at Nantes.

Debenture, in finance, a certificate or document signed by a legally authorized officer, as an acknowledgment of a debt due to some person; a deed or bond of mortgage on certain property for the repayment to a certain person of a certain sum of money advanced by such person, together with interest thereon at a certain stated rate. Debentures are frequently issued by public companies, especially railroad companies, for the purpose of raising money for the completion or carrying on of their undertakings.

In customs, a certificate entitling the person to whom it is granted to a drawback on certain goods exported, the duties on which had been paid.

In public offices, in some government departments, a term used to denote a bond or bill by which the government is charged to pay a creditor or his assigns the money due on auditing his account.

Deboe, William J., American lawyer: b. Crittenden County, Ky., 1849. He was graduated at Ewing College, Illinois, and at the Medical Department of the University of Louisville; practised medicine for a number of years; was admitted to the bar, and practised in Marion, Ky. He was a delegate to the Republican National Convention which met in Chicago and nominated Benjamin Harrison for the presidency in 1888, and was elected superintendent of the schools of Crittenden County in 1890. He was a member of the State senate 1893–6, and was elected to the United States Senate in 1897–1903.

Deb'orah, Hebrew seer or prophetess. She lived in the time of the Judges, and by the aid of Barak delivered the northern tribes from the oppression of Jabin, and secured a peace of 40 years' duration. The triumphal ode (Judges v.) attributed to her is a remarkable specimen of Hebrew poetry.

De Bow, James Dunwoody Brownson, American journalist and statistician: b. Charleston, S. C., 10 July 1820; d. Elizabeth, N. J., 27 Feb. 1867. He studied law, was admitted to the Charleston bar in 1844 became a contributor to the 'Southern Quarterly Review,' published at Charleston, and in 1844 took charge of that periodical as chief editor. Among other papers prepared by him for its pages was an elaborate article, published in 1845 upon 'Oregon and the Oregon Question,' which attracted much attention both in this country and Europe. It was translated into French, and was the occasion of a debate in the French chamber of deputies. In 1845 he removed to New Orleans, and established 'De Bow's Commercial Review.' This enterprise proved successful, and the work attained a circulation greater than has ever been reached by any similar publication in the South. In March 1853 he was appointed superintendent of the United States census. In that position he collected and prepared for the press a large part of the material for the quarto edition of the census of 1850. He afterward compiled the volume entitled 'Statistical View of the United States,' a compendium of the 7th census. In 1853 he compiled from his review a work published under the title of 'Industrial Resources of the Southwest.'

Debraux, Paul Emile, pōl ā-mēl de-brō, French balladist: b. Ancerville, department Meuse, 30 Aug. 1796; d. Paris 12 Feb. 1831. He was an ardent Republican, and wrote for the common people lively songs of wine and love, sung everywhere in tavern and workshop. He was called "the Béranger of the rabble." His best-known songs are: 'Mt. St. John'; 'Belisarius'; 'Say, Do You Remember?'; 'The Soldier's Widow'; 'Marengo.' Béranger published a complete collection of his 'Songs.'

Debreczin, dā-brĕt'sĭn, Hungary, a town on the edge of the great central plain of Hungary, about 113 miles east of Budapest. Its houses are mostly of a single story; and in wet weather the wide but unpaved streets become almost impassable from mud. The principal edifices are the Protestant church, and the Protestant college, with a library of 100,000 volumes, Roman Catholic church, town-house, Piarist college, gymnasium, several hospitals, etc. Both the manufactures and trade are important; the former consisting chiefly of coarse woolens, leather, soap, tobacco-pipes, casks, etc., and the latter being in tobacco, wine, flax, hides, wool, potash, cattle, cheese, etc. There are four large fairs annually, and the swine market is the largest in the kingdom. Debreczin is considered the headquarters of Hungarian Protestantism. The Protestant college, founded in 1792, is

considered the best educational establishment in Hungary. This town suffered much in the wars between the Hungarians and the Turks, and afterward in the religious wars. Pop. (1900) 75,006.

De Bry, dē-brē, **Theodor,** Flemish goldsmith and copperplate engraver: b. Liège 1528; d. Frankfort-on-the-Main, Germany, 1598. He settled in Frankfort-on-the-Main about 1570, and established a printing-house there. The most important of the works issued from his press is the collection of 'Voyages to the East and West Indies,' published in Latin (25 parts, 1590–1634) and German (27 parts 1590–1630).

Debs, Eugene Victor, American socialist: b. Terre Haute, Ind., 5 Nov. 1855. He received a common school education and became a locomotive fireman. He was elected to the Indiana legislature in 1885 and was later an official of the Brotherhood of Locomotive Firemen, and, from 1893 to 1897, president of the American Railway Union. He conducted the strike of 1893 in Chicago, and was later sent to jail for contempt, because of his management of the same, though he pleaded innocence of any crime and requested to be tried by a jury and be allowed to summon witnesses in his defence. Since 1897 he has been prominent in the Socialist movement, and in 1900 and 1904 was the candidate of the Social Democratic party for President of the United States.

Debt, National, the amount which a State admits owing to those who have advanced money for the use of the government on occasions when its expediture has exceeded its income. The amount of a national debt may not be the amount which the nation has borrowed; it is often greater, from the necessity of holding out inducements to capitalists, and also for the increment of interest. When money is bearing low interest, a nation may give its creditors the alternative of receiving payment or allowing a deduction from the nominal amount of their debt. The following table shows the public debts of the nations of the world at the end of the century:

Countries	Debt	
	Total	Per Capita
Gold Standard	Dollars	Dollars
Austria-Hungary	2,821,706,000	68.22
Belgium	506,853,000	76.95
British Africa	185,189,000	37.55
British Australia	1,110,465,000	231.64
British Honduras	169,000	4.97
British North America	72,017,000	14.49
British West Indies	20,459,000	13.63
Bulgaria	50,612,000	15.28
Costa Rica	11,125,000	37.71
Cuba	341,726,000	209.39
Denmark	56,287,000	25.76
Dutch East Indies		
Egypt	481,359,000	49.45
France	5,829,742,000	151.12
Germany	2,573,585,000	60.00
Great Britain	3,090,427,000	76.89
Hawaii	4,489,000	41.18
India and Ceylon	1,200,448,000	4.13
Japan	201,110,000	4.71
Netherlands	470,528,000	94.03
Peru	23,798,000	9.08
Rumania	249,305,000	42.98
Russia	3,837,156,000	35.29
Servia	72,075,000	31.13
South African Republic	13,278,000	12.12
Sweden and Norway	125,688,000	17.92
Switzerland	16,428,000	5.33

Debtor and Creditor, Laws of. One of the earliest institutions among men is the right of holding individual property. Upon this right depends the power of making bargains and effecting exchanges. In various ways bargain-making gives rise to deferred engagements, and obligations are incurred which are called debts. These obligations rest upon a double foundation. The right of holding individual property implies the right of recovering any property which has been intrusted to others, or of claiming possession of any property which others have, for a valuable consideration, agreed to make over to us. The primary foundation of debts, therefore, is the right of holding property. A debt is a contract freely entered into. Whether the right of property is valid or not, it is commonly recognized by the person who incurs debt; no abstract doctrine of the rights of property, therefore, can properly come between him and his creditor to justify the violation of an engagement for which he has accepted an equivalent. Credit affords a means by which those who have no property of their own may acquire important advantages through the use of the property of others, and while proprietary rights are recognized, it is of great consequence to society that the obligations incurred in borrowing should be faithfully fulfilled. Hence a very great practical importance is to be attached to the moral obligation implied in the contract of a debt, independently altogether of any abstract or theoretical views which may prevail as to the soundness of the particular institution of proprietary rights on which that obligation may be founded.

In early and rude states of society the natural tendency is to regard all obligations as sacred and inviolable, and all who from any cause fail to fulfil them as criminal in act or intention, either by omission or commission, and liable to

the most severe and exhaustive punitive treatment. In such a state of society both the primary and secondary foundations of the obligation are likely to be held in extreme estimation. Hence in the earlier stages of society the laws against debtors are universally found to be of the most stringent kind, and as civilization advances, and the relations of society become more complicated, the necessity of repeated modifications of these severe laws becomes apparent. Any modification in favor of the debtor of the consequences of incurring debt, however equitable in itself, necessarily tends to increase the facility with which debt will be incurred, and if these consequences are over-relaxed society will be deprived of a needed protection; debt will be incurred carelessly, and as carelessness borders upon recklessness, and recklessness upon fraud, the lines of distinction between right and wrong dealing will become fainter, the protection due to misfortune, and the condonation necessary to be extended to miscalculation and errors of judgment will become a cover for deliberate conspiracy, and society will become a prey to an organized predatory system of modernized form of highway-robbery, thinly disguised under the forms of commerce. Such are the practical difficulties which the modern theory of the law of debtor and creditor has to encounter.

Among the Jews, under the Mosaic law, debt was treated with great stringency, but there were regulations adapted to discourage the incurring of it, and also some humane restrictions on the power of the creditor after it had been incurred. Lending on usury was forbidden, and the taking of pledges put under severe restriction. The alienation of the estate of an Israelite was also forbidden. The creditor, on the other hand, had power over the person of his debtor, and even over those of his wife and family, and could cause them to be sold in satisfaction of his claim. If the debtor was an alien he might be sold to perpetual bondage, but on the occasion of a jubilee, which was appointed to be proclaimed every 50th year, every Israelitish debtor was set free, and his property, if pledged or sold, returned to him.

Nothing is more common in rude states of society, and under arbitrary and despotic governments, than the liability of the person of the debtor for his debt. This is one of the original sources of slavery. Even in the comparatively enlightened states of Greece and Rome the power of the creditor over the person of his debtor was recognized by law. This power was abolished in Athens by Solon, who is said to have taken his reform from Egypt, where the same unjust law had already run its course. The early Roman law was even more excessive in its undiscriminating severity. By the law of the Twelve Tables the creditors might cut the body of the debtor in pieces and share it among them, they might also sell him and his wife and family to perpetual slavery. In the Middle Ages, notwithstanding the influence of Christianity, the debtor was treated with hardly less severity. Even the Church took the side of the creditor, and the debtor who died without discharge was excommunicated and deprived of Christian burial. As society became more refined the laws against debtors were again gradually ameliorated, but the process was a slow one. Imprisonment for debt in England, except as an instrument for compelling the surrender of the debtors' effects, was only put an end to in the reign of Victoria.

In the United States originally imprisonment of debtors was adopted as a part of the common law, but at the present time imprisonment for debt, except in case of fraud, or of an absconding debtor, does not legally exist in any of the States. Congress, empowered by the United States Constitution to make a uniform bankrupt law, exercised this power, and subsequently repealed the law of imprisonment; and now, by Revised Statutes 990 and 991, no person can be imprisoned for debt by any process issuing out of the courts of the United States, in any State where by the laws of the State imprisonment for debt has been abolished. Most of the States, by constitutional provision, have prohibited arrest or imprisonment for debt, while the other States, either by direct statutes prohibiting imprisonment for debt, or by poor debtors laws, or by insolvent laws, secure the same result; it being held to be against public policy to deprive a man, by imprisonment, of the power to pay his debts, and make him a direct charge upon the State.

Debts, United States Public. These consist of the debts contracted by the nation, the States, and municipalities.

National.— The nation has contracted eight principal debts in its existence, which have overlapped each other and been complicated with incidental loans for special purposes. Five of these were for wars,— that of Independence, the War of 1812, the Mexican war, the Civil War, and the Spanish-American war; the present national debt is mainly for the Civil War. The other three were due to the commercial panics of 1837 and 1857, and the imminent silver bankruptcy of 1893.

At the close of the Revolution, the United States owed to foreigners $10,313,505.91,— $6,352,000 for French government loans, $3,600,000 for Dutch loans, $174,017.13 for Spanish bankers' private loans, and $186,988.78 for 6 per cent certificates of indebtedness to French officers who had served in the Revolution. The domestic debt was upward of $35,000,000; including some $600,000 for funding of about $6,000,000 Continental paper money at a cent on the dollar, and about $2,000,000 in Continental bills of credit. Besides these, the States owed debts which, when they were taken over by the national government under the Constitution, 4 March 1789, were arbitrarily estimated at $21,500,000, and actually assumed at $18,271,786.47. At this time, the principal and arrears of interest on the foreign debt were $11,710,378.62; of domestic debt, $40,414,085.94 (nearly a third of it unpaid interest); making, with the bills of credit and the State debts, an aggregate officially stated in 1791 as $75,463,476, at four and five per cent interest, and thus creating a total interest charge of $4,587,444.81. This aggregate fluctuated around $80,000,000 for many years, the new navy, the Barbary wars, and the Indian wars, etc., preventing much reduction. It reached a maximum of $86,427,120 in 1804, as a result of borrowing part of the $15,000,000 for the Louisiana Purchase. From thence to 1812 it was steadily paid off by an average installment of $5,000,000 a year, till it had dropped to $45,209,737. Then the war with England

intervened, and the debt was not finally closed out till 1834.

The War of 1812 cost $80,500,073.50 in loans which yielded only some $34,000,000, owing to the country's poor credit; and the debt in 1816 stood at $127,334,933. Thenceforward till 1834 it was paid off by a sinking fund and redemptions, with only one interruption: in 1821 $5,000,000 was borrowed to pay the award under the Florida treaty, and the debt rose $3,500,000, to $93,546,670. In 1830 it was $48,565,406; in 1832, $24,322,255; in 1833, $7,001,698; in 1834, $4,760,082; and the next two years saw only $37,513 on the books, not at once redeemable. This extinction left some $40,000,000 surplus in the treasury, of which $37,468,819.97 was deposited unsecured in State banks. The consequent inflation and wild-cat banking, with Jackson's fluctuating and reckless financial methods, caused a crash and panic in 1837, and the fourth quarter's installment could not be, and never has been, repaid. The government had to borrow more money, and after this was paid new government enterprises were undertaken. From $3,308,124 in 1838, the debt grew to $23,461,652 in 1844, with a temporary increase of $12,000,000 the year before; the next year $7,500,000 were cleared off, and in 1846 the balance due stood at $15,550,202. Then came the Mexican war: its costs, and the money paid for cessions of territory, raised the debt to $63,061,858 in 1849, and to $68,304,796 in 1851. Payments on the principal now began again, and in 1857 had reduced it to $28,699,831. The panic of that year and the commercial depression thenceforward again forced a resort to borrowing,—$20,000,000 at five per cent 1858, $21,000,000 six per cents in 1860. This indebtedness was shortly afterward increased by the War loan. By 1860 the debt stood at $64,842,287.

The history of the debt through the Civil War is a financial record which it is difficult to keep separate from a general history of currency, so many devices were utilized in the way of paper money, from postage stamps to interest-bearing bonds circulating as cash. The first loan was negotiated in February 1861, before the actual outbreak of the War. Of $25,000,000 authorized, only $18,415,000 worth of bonds were issued, at six per cent for 20 years; and even these could not command par. On 2 March $35,364,450 in two-year six per cent treasury notes, receivable for customs, were issued. On 17 July 1861 the first great loan was authorized with full sense of the magnitude of the task before us: $250,000,000 20-year seven per cents; the Treasury having authority to issue any part of it in three-year 7.30 per cent treasury notes (the "seven-thirties"), or in demand notes without interest not to exceed $50,000,000, or in one-year 3.65 per cents. On 5 Aug. 1861 an issue of six per cent 20-year bonds was authorized in exchange for the one- and three-year bonds, and the demand notes made receivable for all government dues; this brought the latter from a condition of unsalability to the command of a premium, and the former were readily bought in exchange for the short-term notes. The issue of 7.30's reached $140,094,750, the 3.65's sold largely, and the entire $50,000,000 of demand notes were taken while the 20-year six per cents had an issue of $189,321,200. On 12 Feb. 1862, $10,000,000 more demand notes were issued. In that month also the first of the great popular loans was put on the market, the famous "five-twenties" (redeemable after 5, and payable after 20 years). They were six per cents, and the $500,000,000 authorized was issued in full. Fifteen million dollars more were issued 1864–5. On the 25th of the same month, the first issue of "greenbacks" to the amount of $150,000,000 was made, on 11 July another of equal amount appeared, and on 3 March 1863 still another,—$450,000,000 in all. Of these, $400,000,000 were made permanent, but contractions in 1868 and 1869 reduced their volume to $346,681,016. Several acts, one of this same financially memorable February 1862, authorized the receipt of deposits at five per cent, and the amount was fixed at $100,000,000 on 11 July; on 30 June 1864 another $50,000,000 was authorized, at six per cent. These were all redeemable at 10 days' notice, and redeemed in 1865 and 1866. The success of these loans in 1861–2 had been marvelous; but their magnitude had strained the public credit and resources, and various other means were adopted. In March 1862 one-year six per cent certificates of indebtedness to public creditors were authorized, and $561,753,241 were issued, all redeemed by 1866. In March 1863 the first fractional currency was authorized, postage stamps having been hitherto used as such; a $900,000,000 gold loan was authorized, but only $75,000,000 was issued; and $400,000,000 more in treasury notes for one, two, and three years, of which $477,595,400 was issued; namely in one-year five per cents, $44,520,000; in two-year five per cents, $166,480,000; in three-year six per cents, $266,595,440. These notes were canceled or exchanged by 15 May 1868. In March 1864 the "ten-forties of 1864" were authorized; $200,000,000 of five or six per cent gold bonds, redeemable in 10 and payable in 40 years. Of these, $196,117,300 were issued at five per cent, and $3,882,500 at six per cent. In June 1864 the issue of the "five-twenties of 1864," six per cents, was authorized up to $400,000,000, but bearing bonds circulating as cash. The first loan was negotiated in February 1861, before the actual outbreak of the War. Of $25,000,000 in all, $829,992,500 of 7.30's was issued; all were redeemed by July 1868. After this, several large loans in six per cent five-twenties were made, and loan certificates of deposit were issued; but as they were intended exclusively to redeem treasury or compound-interest notes, and did not increase the public debt, they belong to a history of government finance, not of the debt. In July 1870 a refunding act was passed, to enable the government obligations at high interest to be replaced by others at lower rates.

The amount of the national debt in 1862 was $524,176,412; in 1863, $1,119,772,139; in 1864, $1,815,784,370; in 1865, $2,680,647,870; in 1866, $2,773,236,174. This was the climax; thenceforward with interruptions only during the long depression of 1873–8, it steadily declined, till 1893. In 1881 it was $2,053,353,961; in 1893, $1,545,996,591. At this time the threatened bankruptcy of the Treasury, owing to the enormous accumulations of silver under the Sherman Act, compelled a fresh issue of bonds to preserve the national credit, by increasing the gold reserve. These were five per cents; in 1898 an issue of three per cents was made for the Spanish War. In 1905, exclusive of $1,009,384,969 of certificates and treasury notes offset by an equal amount of cash in the Treasury, the debt was

$1,284,461,413.34; in all $2,293,846,382.34. Of this, the interest-bearing debt was $895,158,940, and the interest charge about $24,176,781, as against $151,000,000 in 1865. Of course, not only has the principal of the debt declined, but the interest rates even more: government three per cents command a heavy premium, and by the act of 14 March 1900 the bonds of all rates were made convertible into two per cents.

State.—The latest returns of State bonded debts show a grand total of $166,636,262. After the assumption of their debts by the national government, the States incurred none of moment till they contracted small loans to assist the government in the War of 1812. They did not attempt any considerable loans for internal improvements till about 1820, but in the next five years had aggregate debts of $12,790,728. In 1830 the total had increased to $26,470,417, in 1835 during the great western "boom," it had risen to $66,583,186; and in the frantic speculation of the three years, 1835-8, $107,823,808 were added to it. By 1840 it was over $200,000,000. But the improvements in western lands thus effected, though in the main good and useful, and some of them since profitable, had far outrun the immediate ability of the property developed to pay for them: several States defaulted principal or interest, or both, and as the Constitution had forbidden States to be sued in the courts, the foreign bondholders were without recourse when they repudiated their obligations. The chief offenders were Pennsylvania, Maryland, Michigan, Indiana, Illinois, Mississippi, and Louisiana. America was an unsavory name in foreign parts, and none the less so that some of the State leaders attempted justifications which the creditors thought impudent dishonesty. From 1840 on, a strong effort was made to have the general government assume the debts once more; in December 1842 a select committtee of Congress was appointed to report, which it did the following March; the total amount then was $207,894,613.35, and the interest charge $10,394,730.64. There were too many obstacles, and the plan fell through: the solvent and prudent States were not inclined to saddle themselves every few years with the obligations of those not so. As a fact, however, the States have not since abused their opportunities. The only cases of repudiation since have been among the Southern States plundered by the "carpet-bag" governments, and saddled with debts at once fraudulent and impossible of payment; though one or two have taken advantage of this plea to repudiate debts not owing to the carpet-bag régime and not difficult of payment. In 1880 the combined State debts amounted to $250,722,081; so that they have been reduced by nearly one fourth within a generation, although not wholly by being paid. Nearly every State in the Union now has constitutional prohibitions from borrowing over a certain amount or per-centage for public purposes.

Municipal.—The total debts of the 105 largest cities of the United States foot up about $1,036,618,717; of which New York has considerably over one third, namely $421,557,114. More than $125,000,000 more is held by two others, Boston ($62,427,219) and Philadelphia ($63,458,470), the three together carrying over half the entire municipal debt of the country. None others have even half so much as either of the two latter: and singularly, the fourth in the list, Cincinnati is only tenth in nominal, though higher in actual population. She has $33,570,583; while Chicago, the second in population, has $22,618,000. Cleveland, St. Louis Baltimore, New Orleans, Buffalo, and Jersey City, in order, with $22,000,000 to $16,000,000, have together $109,429,519. These 11 cities have in all about $713,060,905, or two thirds of the entire United States municipal debt. Washington, Newark, Providence and Pittsburg are others which have over $10,000,000. It must be remembered that there are sinking funds which heavily reduce this total; and that most of it has been contracted for conveniences or beauties which attract population and so reduce taxes. More than one fifth of the whole, indeed, is for water-works, which are not in any proper sense debts at all, as the water is paid for directly. The water-works systems of the country represent probably close on $200,000,000 of investment. About six per cent is for parks and public places, nearly as much for bridges and harbor improvements, about 10 per cent for railroad aid, and nearly four per cent for public buildings. A great number of municipalities also are forbidden by law to incur above a certain fixed or contingent amount of debt.

Début, dā-bū', a French word which has been adopted into the English language, signifying generally a beginning or entrance, but specially applied to the first appearance of an actor or actress on the stage, or to a first appearance in a particular theatre. In these circumstances, the actor is called a *débutant;* the actress, a *débutante.* The expression is very frequently used with reference to a young lady's first entrance into society.

Deca (Gr. signifying "ten"), a prefix of frequent occurrence; as in *Decapolis,* a group of 10 cities; *decalogue,* the 10 commandments; *decametre,* a measure of 10 metres, etc. From *deca* is formed *decade,* a collection or group of 10. In the calendar of the French Republic the term decade was used to designate the week of 10 days, which were severally named *primidi, duodi, tridi, quartidi, quintidi, sextidi, septidi, octidi, nonidi,* and *decadi.* See CALENDAR.

Decachord, děk'a-kôrd (Gr. *dekachordos,* ten-stringed), an ancient Greek instrument of 10 strings, triangular in shape; also a kind of large guitar with 10 strings.

Decade (Latin, *decas,* from the Greek *deca*), a group or division of 10, especially a period of 10 years, a decennium. The books of Livy are divided into decades. In the French Revolution, decades, each consisting of 10 days, took the place of weeks in the division of the year. See CALENDAR.

De'cadents, The, a school of artists and writers, the followers of which delight in the more or less morbid refinements of feeling and style, and pride themselves upon this perversion of taste. The decadent is fond of the products of declining civilization corrupted by many centuries of culture, of works too highly seasoned and vitiated, which presage the final dissolution of a social order fallen into decrepitude, and shuns the simple, the natural, the healthful, clinging only to the artificial and the complicated in life and character. The name of decadents may rightly be given to those who make a subtile virtuosity out of art. Among French writers

Baudelaire was the first theorist of this school, and his influence was felt by many writers of the "end of the century," such as the Goncourts and Maurice Barres. The decadents' school of poetry is best represented by Stephane Mallarmé and Verlaine, and its disciples are numerous, including many men of undoubted talent who have combatted the stiffness and dryness of the Parnassians, not without success. They are often termed deliquescents and symbolists; the latter term is well chosen as indicating their aims and manner.

Decalogue, the Ten Commandments, called by the Hebrews Ten Words, of which Decalogue (*οἱ δέκα λόγοι*) is a literal rendering. In all versions of these Ten Words whether as taken from Exodus xx. or from Deuteronomy v., there is essential verbal agreement; but the precepts are differently distributed by the Latin Church and the Lutheran on one hand, and the Greek Church and the Reformed on the other; and the Church of England stands with the Reformed, or the churches of Calvinian descent. What in the Roman Catholic and the Lutheran arrangement of the Decalogue is the first commandment is in the arrangement adapted by those other bodies the first and second; and what in the Roman Catholic and Lutheran arrangement is the ninth and tenth is for the others the tenth. In this distribution of the matter of the Decalogue some Protestant controversialists descry an endeavor on the part of the Roman Church to evade the prohibition of image-worship, in particular, because in a necessarily succinct popular formula of the first commandment no mention is made of images: "I am the Lord thy God: thou shalt not have strange gods before me." But it is replied that the inculpated division and distribution of the matter of the Decalogue is not peculiar to the Roman Church, for in the Talmud, the Targum of Jonathan, and in the writings of many rabbinical commentators the prohibition of worship of strange gods and the prohibition of worship of images are classed as one commandment, or one "word," the second, for they regard the proœmium, "I am the Lord thy God, etc.," as the first "word" but they comprise in the tenth commandment the prohibitions of the 9th and 10th of the Roman Catholic scheme. The Lutheran scheme is in accord with that of the Latin Church, save that it follows the order of the prohibitions of covetousness given in Deuteronomy, not that in Exodus, which is the order followed by the Latin Church.

Decameron, dē-kăm′ę-rŏn, anything of 10 days' occurrence; also the title given to a collection of tales by Boccaccio, written in 10 parts, each part containing 10 stories, and being supposed to occupy one day in the narration. Boccaccio represents the stories as being told by seven ladies and three gentlemen, who had fled from Florence into the country to escape the fearful plague of 1348, and who had no other means of passing the time.

De Camp, John C., American naval officer: b. New Jersey 5 Oct. 1812; d. Burlington, N. J., 24 June 1875. He entered the navy in 1827; served in the frigate Constitution off the coast of Africa in 1854, and received the rank of commander the next year. During the Civil War he had command of the steam sloop Iroquois in the attack on Fort Jackson and Fort Philip, and served on the Mississippi under Farragut, distinguishing himself especially at Vicksburg. In 1868–9 he commanded the receiving ship Potomac, and was retired in 1870.

Decamp′, Joseph Rodefer, American landscape and figure painter: b. Cincinnati 5 Nov. 1858. He was a pupil of Frank Duvenant in Munich and became a member of the American Society of Artists. His landscapes, though generally realistic in treatment, show the influence of impressionistic methods.

Decamps, Alexandre Gabriel, ä-lĕks-ändr gä-brē-el dė-käṅ, French painter: b. Paris March 1803; d. Fontainebleau 23 Aug. 1860. He was educated in the studio of Abel de Pujol. When a young man he made a journey to the East, and returned from thence with a collection of sketches, from which he afterward produced some of his finest pictures. Among the more celebrated of these are: 'The Grand Bazaar'; 'Relieving Guard at Smyrna'; 'A Turkish Café'; 'Turkish Children Going Out of School'; and 'Arab Horsemen Passing a Ford.' Of pictures of another class are: 'The Shepherd and His Flock Overtaken by a Storm'; 'An Italian Village'; 'The Hawking Party'; 'Spaniards Playing at Cards'; 'Don Quixote and Sancho Panza.' Decamps also produced some historical and sacred pictures of a high order of art, including the 'Defeat of the Cimbri'; 'The Miraculous Draught of Fishes'; 'Joseph Sold by His Brethren'; 'The Finding of Moses'; and others. The leading merits of this painter are great originality of conception and vigor of expression, with a wonderful skill in the treatment of light and shade.

De Candolle, Alphonse Louis Pierre Pyrame, äl-fôṅs loo-ē pē ăr pē-räm dė käṅ-dōl, Swiss botanist: b. Paris 28 Oct. 1806; d. Geneva 4 April 1893. He was a son of Augustin De Candolle (q.v.) and also published several works of note, the most important being: 'Geographical Botany' (1855) and 'Origin of Cultivated Plants' (1883). He also edited the 'Memoirs' of his father (1862).

De Candolle, Augustin Pyrame, Swiss botanist: b. Geneva 4 Feb. 1778; d. there 9 Sept. 1841. He studied chemistry, physics, and botany in Paris, where in 1797 his earliest work, on lichens, was published. Other works quickly followed, including his 'Astragalogia' (1802) and his valuable 'Essays on the Medicinal Properties of Plants' (1804). In 1802 he was elected to an honorary professorship in the Academy of Geneva, but remained in Paris, and delivered his first botanical lectures in the Collège de France in 1804. His 'French Flora' appeared in four volumes in 1805. Employed by the government, he visited all parts of France and Italy in 1806–12, investigating their botany and agriculture. The results of his journeys are partly embodied in a supplement to the 'Flore.' He was appointed in 1807 to a chair at Montpellier, where he lived from 1810 to 1816; he then retired to Geneva, where a professorship of botany was founded for him, and where he spent the remainder of his life. De Candolle was an industrious writer, and the fruits of his studies in systematic botany and the properties and natural affinities of plants are embodied in a considerable number of works. The greatest of

these, his 'Natural System of the Vegetable Kingdom' (Vols. I. and II. 1818–21), was commenced on too grand a scale, and was continued within more reasonable limits in the 'Preliminary View of the Natural System of the Vegetable Kingdom' (17 vols. 1824–73, the last 10 by his son and others).

Decapoda, an order of malacostracous *crustacea* (q.v.), in which the fourth to the eighth pairs inclusive of the thoracic appendages form uniramous walking limbs; the head and thorax are united to form a cephalothorax, and the eyes are stalked. Two sub-orders are usually recognized: (1) The *Macrura,* in which the abdomen is not permanently flexed beneath the thorax, but forms a long, powerful swimming organ terminated by a so-called caudal fin; (2) the *Brachyura,* having the abdomen much reduced in size and permanently flexed beneath the thorax, which is usually shorter than wide, while the antennæ and antennules are much reduced in size. See CRAB; LOBSTER; SQUID; CEPHALOPODA. The crab is typical of this group.

Deca'tur, Stephen, American commodore: b. Newport, R. I., 1751; d. Philadelphia 14 Nov. 1808. During the war of the American Revolution he commanded several privateers, and acquired some reputation by the capture of English ships. At the commencement of hostilities with France in 1798, he was appointed to the command of the Delaware of 20 guns, in which ship he cruised during the years 1798–9 on the American coast, and in the West Indies, capturing at different times the French privateers Le Croyable of 14, and Marsuin of 10 guns. In 1800 he commanded a squadron of 13 sail on the Guadeloupe station, the Philadelphia, a frigate of 38 guns, being his flagship.

Decatur, Stephen, American commodore: b. Sinepuxent, Md., 5 Jan. 1779; mortally wounded in a duel near Bladensburg, Md., 22 March 1820; d. at Washington, D. C., the same day. He was the most conspicuous figure in the naval history of the United States for the 100 years between Paul Jones and Farragut. Contrary to the general opinion Decatur's family originated in Holland, where the name De Kater is of great antiquity. A scion emigrated from Amsterdam to Bordeaux early in the 17th century. He married a French woman of some rank and one of their descendants, a merchant ship owner, was ennobled by Louis XV. in 1733. From him sprang Étienne Decatur, reputed a lieutenant in the French navy. He came to Newport before the middle of the 18th century, married Priscilla Hill in 1751, and died in 1753, leaving one son, Stephen Decatur (q.v.), the father of the commodore. This Decatur married Anna Pine, an Irish woman. Of them was born the great commodore. He was well educated at the Episcopal Academy and at the University of Pennsylvania. Refusing a clerical life, in 1796 he entered the counting house of a firm of ship owners. In 1797 he got out the keel pieces of the frigate United States and was on her when she was launched, the first ship of the United States navy. Through the instrumentality of Commodore John Barry he was appointed a midshipman in the navy by President Adams, 30 April 1798. He cruised in the West Indies during the French war in the United States, taking part in various minor naval actions. Such was his aptitude and ability that he was commissioned lieutenant, 3 June 1799.

At the outbreak of the Tripolitan war, in command of the schooner Enterprise, he captured the bomb ketch Mastico, 23 Dec. 1803. In this ketch, renamed the Intrepid, he destroyed the frigate Philadelphia in the harbor of Tripoli. The Philadelphia had been chasing hard inshore and had run upon a reef. She had been surrounded and captured by the Tripolitans, who had floated her and towed her into the harbor. The naval force of the United States in the Mediterranean was small. So soon as the Philadelphia could be refitted the preponderance would be with the Tripolitans. It was necessary to destroy her. Decatur volunteered. He boldly entered the harbor in the Intrepid, succeeded by strategy in getting alongside the Philadelphia undiscovered. The frigate was carried by boarding. Her crew were killed or driven overboard. The Americans set fire to her and made their escape under a furious bombardment from the shipping and batteries. Decatur did not lose a man. There is no authority for the statement that Lord Nelson pronounced this "the most bold and daring act of the age," but the phrase accurately described the undertaking.

On 3 Aug. 1804 Decatur commanded the American gunboats in their attack upon the Tripolitan flotilla. He captured two gunboats by the most desperate hand-to-hand fighting in a battle which has been called the "biggest little fight in history," and well merits the name. He took part in four other attacks on Tripoli with his usual distinction. For the burning of the Philadelphia he was commissioned a captain, and at the age of 25 was placed in command of the frigate Constitution. At the close of the war he returned home, having divided with Commodore Preble the honors of the campaign.

On 8 March 1806 he married Miss Susan Wheeler of Norfolk, Va. He had no children, and his wife survived him many years. At the outbreak of the War of 1812 he was in command of the United States, 44, in whose building he had assisted, on which he had been launched, and in which he had made his first cruise. On 25 Oct. 1812 the United States captured the British frigate Macedonian, 38, Capt. John Surman Carden. The Macedonian was dismasted and almost cut to pieces. She lost 35 per cent of her complement, or 89 killed or mortally wounded, and 15 severely wounded, besides many others slightly wounded. On the American ship 7 were killed or mortally wounded, and 5 severely wounded. The United States was practically intact. The weather remained favorable and by strenuous work for two weeks the Macedonian was patched up and brought back to New York, the only trophy of the great frigate actions of the war that remained afloat. The disparity in force in favor of the United States was about 7 to 5, in damage inflicted about 9 to 1.

After being blockaded in New London for a year Decatur took command of the frigate President, 44. On the night of 14 Jan. 1815, in the midst of a howling gale, the blockaders having been dispersed by the storm, he put to sea from New York. Through an error on the part of the pilot, caused by the misplacing of

buoys, the President ran upon a shoal and almost broke her back. Before she was got off the straining seriously impaired her sailing qualities. Decatur would have returned to the harbor but the gale prevented. On the morning of the 15th, off the eastern end of Long Island, he fell in with a British squadron of five heavy ships. Every effort was made to escape, but in the afternoon the President was brought to by the frigate Endymion, 44, which had been built especially to cope with ships of her class. A running fight ensued until 6 o'clock, when Decatur attempted to lay the Endymion aboard, hoping to capture her, scuttle the President and escape on the British ship, but the Endymion had the heels of the President and avoided the maneuver. For two hours the vessels sailed side by side in furious conflict. At the end of this time the Endymion was entirely silenced. She had been fought to a standstill. Decatur could not take possession for fear of the other ships. He tried running again, but the President had been severely injured in the battle, and about 11 o'clock she was overhauled by two British frigates, which ran alongside and opened fire. The British flagship was also in range and the last ship was coming up rapidly. The President had lost 24 killed and 55 wounded, including most of her deck officers. Decatur himself had been twice wounded. Further conflict with two fresh ships was hopeless. Decatur reluctantly struck his flag and surrendered to the commodore of the squadron. He was court-martialed for the loss of his ship, and acquitted of any misconduct in words of the highest commendation.

After the close of the war he was placed in command of a squadron and sent to the Barbary States to exact reparation for injuries and to enforce treaties of peace. His squadron captured the Algerine frigate Meshouda and the brig Estedio on 17 and 19 June. On 30 June 1815 he exacted submission and peace from the Dey of Algiers; on 26 July the same from the Bey of Tunis; and on 7 August the same from the Bashaw of Tripoli. The treaties were made at the mouth of the cannon and the indemnities demanded were paid immediately. Never has American diplomacy participated in more vigorous and successful negotiations.

In 1816 he was appointed naval commissioner and on 22 March 1820 he was killed in a duel with Commodore James Barron. The cause of this duel arose from certain strictures which Decatur passed on Barron. Barron had been suspended for his conduct on the Chesapeake when she was attacked by the Leopard in 1807. He had not returned to the United States during the War of 1812 but had remained in England, where he claimed to have been imprisoned for debt. When he applied for reinstatement after the close of the war Decatur opposed his request. He need not have entertained Barron's challenge save for a too nice sense of honor. He is buried in Saint Peter's church-yard, Philadelphia.

Loyalty to his country was the very breath of life to Decatur. Our judgment does not entirely approve the ethic significance of his famous sentiment, "My country — may she ever be right, but, right or wrong, my country"; but our affections tend to make the sentiment our own. There is a ring of sincerity in the words and in him which wins us in spite of all.

Consult Brady, 'Decatur'; Mackenzie, 'Decatur'; 'Autobiography of Commodore Morris'; Allen, 'Navy and Barbary Corsairs'; various naval histories, etc.

CYRUS TOWNSEND BRADY.

Decatur, Ala., city, county-seat of Morgan County; on the Tennessee River and the Louisville & Nashville, and Memphis & Charleston railroads; 75 miles north of Birmingham. It has extensive manufactures of agricultural implements, engines, foundry products, lumber, sash and blinds, furniture, iron, flour, cotton, cottonseed oil, and leather. Pop. (1910) 4,228.

Decatur, Ga., town, county-seat of De Kalb County; on the Georgia Railroad; six miles east of Atlanta. Decatur was settled about 1822 and is governed by a mayor and a council of six members elected by popular vote. It is connected with Atlanta by two electric street railroads; and is the seat of the Agnes Scott Institute for young ladies, and the Donald Fraser School for boys. A battle was fought here 20 July 1864 between a portion of Sherman's army, under Gen. Thomas, and the Confederates under Gen. Hood, the latter retreating at nightfall. Pop. (1900) 1,418.

Decatur, Ill., city, county-seat of Macon County; near the Sangamon River, and on the Wabash, the Illinois Central, the Cincinnati, Hamilton & Dayton, and the Vandalia R.R.'s; 173 miles southwest of Chicago and 38 miles east of Springfield. It was settled in 1830 and in 1836 was incorporated. Decatur is in the midst of the famous Illinois corn belt, and is the trade centre of several counties. The chief manufacturing establishments are corn mills (the largest in the United States), railroad shops, iron works, flour mills, planing mills, agricultural implement works, engine and boiler works, casket and coffin factories, bridge works, and mantle factories. The government census of 1900 gives the number of manufacturing establishments, 239; the capital invested, $3,632,263; the number of wage earners, 2,313; the annual wages, $994,659; the cost of material, $3,690,802; and the value of the products, $5,896,492. The city has a large trade in grain, coal, live-stock, and manufactured products.

The principal public buildings are the government building, the county court-house, the municipal buildings, Saint Mary's Hospital, the churches (about 25 buildings), and the schools. There is a good system of public schools, including a well equipped high school. There are two parish schools. The principal departments of the James Milliken University are located here. There are three national banks. The government is administered under a charter of 1886 which provides for a mayor, who holds office two years, and a city council. The majority of the administrative officials are appointed by the mayor. The city attorney, treasurer, and clerk are elected by the people. The city owns and operates the electric light plant and the waterworks. Pop. (1890) 16,841; (1900) 20,754.

E. A. GASTMAN,
Supt. of Schools of Decatur, Ill.

Decatur, Ind., city, county-seat of Adams County; on the Saint Marys River, and the Grand Rapids & I., Toledo, S. L. & K. C. and

Erie R.R.'s; 20 miles southeast of Fort Wayne, and near the eastern boundary of the State. Its principal industries are the manufacturing of lumber, brick, and machinery, and stone-quarrying. It has municipal water and lighting plants. Pop. 4,142.

Decatur, Mich., town of Van Buren County; on the Michigan Central Railroad, 24 miles southwest of Kalamazoo. It is in a rich farming section and has an important trade in grain, fruit, celery, and peppermint. The industries are a large measure works, novelty factory, foundries, and manufactures of flour, stoves, etc.; and two grain elevators. Pop. (1900) 1,356.

Decatur, Texas, town, county-seat of Wise County; on the Fort Worth & Denver Railroad; 45 miles northwest of Fort Worth. The town is the trade centre of an agricultural region, and its industries are chiefly those of a cotton-growing country, with the quarrying of limestone. The Northwest Texas Baptist College is located here. Pop. 1,562.

Decazes, Elie, ā-lē dē-käz, Duc, French statesman: b. St. Martin du Laye, Gironde, 28 Sept. 1780; d. Decazeville, France, 25 Oct. 1860. He gained the confidence of Louis Bonaparte, king of Holland, whom he served even after his abdication in 1810, but joined the cause of the Bourbons in 1814, and under the second restoration discharged the duties of prefect of police at Paris with marked ability. In 1818 he became home minister, and in November 1819, premier. After the assassination of the Duke de Berry, in 1820, he resigned, and Louis XVIII. made him a duke, and his ambassador to England, where he remained till December 1821. Under the reign of Charles X. he opposed the extreme measures of the government, and after 1830, adhered to Louis Philippe. From 1834–48 he was grand referendary of the peers.

Deceased Wife's Sister Marriage Bill, a bill to legalize marriage between a man and the sister of his deceased wife that has been brought up in almost every session of the British Parliament since 1835, when Lord Lyndhurst secured the passing of a bill, which declared all such marriages null and void. The bill legalizing marriage with a deceased wife's sister has passed the House of Commons several times, but till 1896 was invariably rejected in the House of Lords, with, however, decreasing majorities. In 1896 the bill was passed by the lords, but went no farther. The Colonial Bill passed in the House of Commons more than 20 years ago, and in the House of Lords during the session of 1898, to make marriages of this class legally contracted in the colonies legal also in England, and the Scotch Bill, having a similar object, has also never been carried, though there are not wanting high authorities who pronounce such marriages legal in Scotland even now, without any special permissive legislation. It may be added that marriage with a deceased wife's sister has been specially legalized under the sanction of the Crown in all the Australian colonies, in Canada, Barbados, Ceylon, Mauritius, New Zealand, South Africa, and Jersey. Bills similar to the English bill have also been passed in Natal. These were, however, refused ratification (by the Crown) for special or technical reasons. Throughout India marriages of this kind are universally legal among all sects and creeds, except British subjects whose domicile is Great Britain. In every Christian country, except Great Britain, such marriages are legal.

December, the 12th month of our year, from the Latin *decem,* ten, because in the Roman year instituted by Romulus, it constituted the 10th month, the year beginning with March. In December the sun enters the tropic of Capricorn, and passes our winter solstice. This month was under the protection of Vesta.

Decemvirs, dē sĕm'vĕrz, the 10 men appointed to codify the laws of ancient Rome. Commissioners were sent to Greece to study Greek statute law, and on their return (45 B.C.) all the magistracies were suspended, and a commission of 10 patricians (*decemviri legibus scribendis*) appointed with consular powers to reduce the laws to writing. The finished code, after being ratified by the comitia of the centuries, was erected in the Forum inscribed on 10 tables of wood. Next year the decemvirate was renewed, and added two tables. The whole code was known as the Twelve Tables (q.v.). The president of both the decemvirates was Appius Claudius (q.v.).

Dechamps, Adolphe, ä-dōlf dē-shäṅ, Belgian journalist and statesman: b. Melle 17 June 1807; d. near Brussels 19 July 1875. Early in life a disciple of Lamennais, he subsequently became an orthodox Roman Catholic. From 1843 to 1845 he was minister of public works, and from 1845 until August 1847, when the triumph of the liberal party led to his secession, minister of foreign affairs. From 1837 to 1851 he conducted the Catholic 'Revue de Bruxelles,' founded by himself and Dedecker. He was an able administrator and an influential parliamentary speaker. He was the author of: 'L'Empire et l'Angleterre' (1860); 'La France et l'Allemagne' (1865); 'Le Prince de Bismarck et l'entrevue des trois empereurs' (1873).

Decid'uous (Lat. *deciduus,* that falls down, from *decidere,* fall down, from *de,* down + *cadere,* fall), in botany, a term applied to various organs of plants, particularly leaves, to indicate their annual or periodic fall. When the calyx of a flower falls with the corolla it is called deciduous; when it falls on the expansion of the flower it is called caducous. Deciduous trees are those which for the most part annually lose and renew their leaves. In cold and temperate countries the fall of the leaf in autumn and the restoration of verdure to the woods in spring are among the most familiar phenomena of nature, connecting themselves also very intimately with the feelings, habits, and circumstances of mankind. The greater part of the trees and shrubs of temperate regions are deciduous; but within the tropics the forest retains always its luxuriance of foliage, except in countries where the dry season is extremely marked. There many trees lose their leaves in the dry season, and exhibit the same partial suspension of vegetative life. In warm countries the leaves of deciduous trees frequently remain for two or more years. Trees not deciduous are called evergreens, and evergreens never lose all their leaves at once.

Deciduous Teeth. See TEETH.

Decimal Arithmetic, the common system of arithmetic, in which the figures or digits ranged in a row, increase in value by a multiple of ten as they are read from right to left, and decrease at a similar ratio from left to right. Also that part of the science of numerical calculation which treats of decimal fractions. See FRACTIONS.

Decimal Fraction, a fraction whose denominator is a decimal or power of 10. Thus $\frac{1234}{100}$ is a decimal fraction. It may be decomposed into the sum

$$\frac{1000}{100} + \frac{200}{100} + \frac{30}{100} + \frac{4}{100}$$

$$= 10 + 2 + \frac{3}{10} + \frac{4}{100}$$

By an obvious extension of the method of local values, where each digit has 10 times the value of the like digit, which immediately succeeds it the above decimal fraction may clearly be written more concisely in the form 12.34, where the decimal point after the 2 merely serves to indicate which digit represents units.

In this abbreviated form a decimal fraction is termed a decimal. For the purpose of indicating the unit's place, other and less objectionable methods have been proposed. The operations of addition, subtraction, multiplication, and division may be applied to decimals in exactly the same manner as to integers; hence their great utility. They present, nevertheless, this disadvantage, that comparatively few fractional quantities or remainders can be exactly expressed by them; in other words, the greater number of common fractions cannot be reduced, as it is called, to decimal fractions, without leaving a remainder.

Common fractions, such as $\frac{1}{2}$, $\frac{3}{8}$, $\frac{1}{4}$, $\frac{3}{5}$, and $\frac{8}{25}$, for instance, can be reduced to decimal fractions only by multiplying the numerator and denominator of each by such a number as will convert the denominator into 10, or 100, 1,000, etc. (The common process is merely an abridgment of this.) But that is possible only when the denominator divides 10 or 100 without remainder. Thus, of the above denominators, 2 is contained in 10, 5 times; 4 in 100, 25 times; and 25 in 100, 4 times; therefore,

$$\frac{1}{2} = \frac{1 \times 5}{2 \times 5} = \frac{5}{10} = .5; \quad \frac{1}{4} = \frac{1 \times 25}{4 \times 25}$$

$$= \frac{25}{100} = .25; \quad \frac{9}{25} = \frac{9 \times 4}{25 \times 4} = \frac{36}{100} = .36$$

But neither 3 nor 7 will divide 10 or any power of 10; and therefore these numbers cannot produce powers of 10 by multiplication. In such cases we can only approximate the value of the fraction.

Decimal System. See METRIC SYSTEM.

Decima'tion, in war, the selection of the tenth man of a corps by lot for punishment, as in case of a mutiny. It was early practised by the Romans. Sometimes every tenth man was executed; sometimes only one man of each company, the tenth in order, as was the case when the Saxons mutinied against Blücher before the battle of Waterloo.

The practice was followed by Essex at Dublin (1599), by the Austrians at Leipsic (1642), and by the French at Trèves (1675). The term is frequently used in a loose way for the destruction of a great but indefinite proportion of people, as of an army of inhabitants of a country.

Decip'ium, or Decip'pium (Lat. "deceptive"), a metallic element discovered by Delafontaine in the mineral samarskite, and also observed by him in sipylite. Decipium is not yet universally recognized among chemists as entitled to a place in the list of elements, but the symbol Dp has been assigned to it, and its atomic weight has been found to be about 171, if (as appears probable) its oxid has the formula Dp_2O_3. If the formula of the oxid is DpO, then the atomic weight must be taken as about 106. Decipium is said to possess properties that are very similar to those of cerium and gadolinium. It forms colorless salts, the acetate being easily crystallizable. The double sulphate of decipium and potassium is insoluble in a saturated solution of potassium sulphate, and advantage has been taken of this fact to effect the separation of decipium from terbium.

Decius, Gaius, gā'yūs dē'shĭ-ŭs, **Messius Quintus Trajanus,** Roman emperor: b. Bubalia, Pannonia: d. 251 A.D. He reigned from 249 A.D. to 251 A.D. He persecuted the Christians, and perished with his army in a bloody battle near Abricium against the Goths, through the treachery of Gallus, who succeeded him as emperor.

Decius Jubellius, Roman general. He was appointed to the command of the Campanian legion, which had been stationed at Rhegium for its protection 281 B.C. Under pretext that the inhabitants were intending to betray the garrison to Pyrrhus, he perpetrated the greatest atrocities. Shortly after, having been attacked by a disease in his eyes, he sent to Messana for a physician, who happened to be a native of Rhegium. The physician, to revenge the cruelties inflicted on his countrymen, prescribed an application, enjoining Decius to continue it, however painful it might be, till the physician again returned. The pain became insupportable, and at length Decius found that his sight was destroyed. To complete his punishment, the Romans gave effect to the complaints of the citizens, and he perished by his own hands in a Roman prison.

Decius Mus, Publius, Roman consul. In a war against the Latins 340 B.C., he devoted himself to death for his country, that is, after certain rites, rushed into the midst of the foes to certain death. His example was followed by his son, and, according to some historians, by his grandson. Such acts of self-devotion (*devotiones*) were not unusual at that time, when patriotism and piety exerted a powerful influence.

Deck, a horizontal platform or floor extending from stem to stern of a ship and covering in the hold. In ships of large size there are several decks one over the other. The topmost deck, which is indeed the main deck of a vessel, is called the spar or flush-deck; the portion of this which stretches from the foremast to the stem is called the forecastle. The quarter deck is in the stern.

Decken, Karl Klaus von der, kärl klows fŏn dăr dĕk'kĕn, German African traveler:

b. Kotzen, Mark of Brandenburg, 8 Aug. 1833; d. Africa 25 Sept. 1865. He entered the Hanoverian army, which he left after 10 years' service (1860) to follow his bent toward travel. On Barth's advice he went to Zanzibar, and started thence on a journey to Lake Nyassa, which failed through the treachery of his Arab guide. Next year he started on a second and successful journey to the mountain-regions of Kilima-Njaro. In the following year, with Kersten, he climbed that mountain to the height of 13,780 feet. In 1863 he made an extensive voyage along the east coast of Africa, after which he returned to Europe to plan a great expedition for the exploration of east African rivers. This journey ended in disaster, and Decken was murdered by a Somali.

Decker, Sir **Matthew,** English political economist: b. Amsterdam 1679; d. 18 March 1749. He went to London in 1702, and having embarked in commerce, attained the greatest success; was naturalized; received a baronetcy in 1716, and subsequently sat in Parliament. He published anonymously two pamphlets which were much discussed: one (1743) proposed to raise all the public supplies from a tax upon houses; the other, on the decline of Great Britain's foreign trade (1744), contained many good arguments for free trade.

Decker, Thomas. See Dekker, Thomas.

Declaration. (1) That part of the process or pleadings in which a statement of the plaintiff's complaint against the defendant is set forth, with the additional circumstances of time and place when and where the injury was committed, where these are requisite. (2) A simple affirmation allowed in certain cases to be taken instead of an oath or solemn affirmation. (See Affirmation; Oath.) In the United States, the form of an oath is immaterial, provided it be such as the witness believes is binding upon his conscience. It is essential that the oath, declaration, or affirmation be administered in a manner prescribed by law. Mere technical variations do not affect the validity of an oath, and verbal deviations are immaterial. Perjury may be committed although the person was improperly sworn. No person will be permitted to make a declaration or affirmation unless he has conscientious scruples against swearing or taking an oath. Declaration in lieu of an oath or affirmation is becoming very general throughout the United States. (3) The statement made by a prisoner, on being arrested on suspicion of a crime, which is taken down in writing.

Declaration, Dying. The rule that secondary or hearsay evidence is inadmissible suffers an exception, in law, in the case of a declaration made by a person convinced of his impending death, and who may not survive the trial of the accused. In Scotland, the dying declaration of a witness is admissible even though he is not himself conscious of the danger of death, and in the United States a declaration is frequently admitted, both in civil and in criminal cases, as primary evidence, without regard to the immediate apprehensions of death. The principle under which the dying declaration is admitted is that the awful situation of the dying person is as powerful over his conscience as the obligation of an oath, and does away with all motive to disguise the truth. Accordingly the person against whom a dying declaration is put in evidence may be allowed to show that the deceased was not of such a character as to feel the religious obligation of his situation. A dying declaration may be adduced for as well as against a person accused of crime; and there are cases on record in which persons charged with murder have been successfully exculpated on this kind of evidence.

Declaration of Independence, United States. The steps by which the extra-legal *de facto* governments of the colonies during the early Revolution — the committees of correspondence and safety — were turned into formal legislative bodies, are detailed under Constitutions, State, and Congress, Continental. But only a few persons, chiefly in the North, at first contemplated separation from the mother country. That they could have expected to conclude a victorious war by land and sea on any other terms, or to dissolve a successful common government and return to disintegrated nullity, seems so incredible that a certain section of historical scholars set down their professions of loyalty to sheer hypocritical falsehood. The history of sincere attempts at "conciliation" up to and far into the Civil War is sufficient answer to this charge. A still better answer is, that the alleged facts are misstated. The difficulty rises from a failure to notice the synchronism of events and views: opinions changed as circumstances changed. The war began in New England, and there it was readily seen to involve independence; the southern colonies thought the difficulty not beyond accommodation till the war was shifted to their own territory in the spring and summer of 1776, when they promptly came over; and the middle colonies, which the war did not touch till after the Declaration, fought it almost to the last. No coincidences are more striking than that the attack on Fort Moultrie was on 28 June 1776, and the South Carolina delegates changed their votes from no to yes 1 July; and that while the New York delegates refused to vote on the Declaration for lack of authority, it was ratified by a New York convention a week after Howe's arrival at Staten Island, 30 June.

The first Congress, of 1774, assumed neither executive nor legislative authority. The second, early in its existence (6 July 1775), formally disclaimed any purpose of separation. The first half-unconscious step was the appointment, November 1775, of five commissioners to maintain communications with friends of the colonies in "Great Britain, Ireland, *or elsewhere*": only independent countries send ministers. Thomas Paine's 'Common Sense,' urging independence as inevitable, and the sooner the better, appeared 9 Jan. 1776; it had wide influence, and unlocked many tongues. So general was the concurrence with Paine's views that in fear of them, three of the middle colonies — New Jersey, Pennsylvania, and Maryland — instructed their delegates to vote against any such measure; the other two, New York and Delaware, were bitterly divided, and their delegates took no part in forwarding the independent movement; South Carolina was also hostile, contrary to its usual habit of eager initiative — probably from fear of England stirring up the great Indian confederations against the South, as was afterward done. But events pushed them on. British naval captures led Congress,

23 March, to declare all British vessels lawful prize; and on 6 April it opened all United States ports to all vessels other than British. This was an act of absolute sovereignty, acknowledged or not. The colonies, under instructions from Congress, were steadily forming State governments (see CONSTITUTIONS, STATE); and Congress 10 and 15 May recommended all the remaining ones to take the same step, which of course involved making their common Union independent also. John Adams was the foremost agent in all this work. The North Carolina convention 22 April resolved to "concur with those in the other colonies in declaring independence." On 17 May Virginia instructed her delegates in Congress to move a "Declaration of Independence"; and on 7 June Richard Henry Lee made a motion to that effect in Congress, which was seconded by John Adams. On the 8th and 10th this was debated in committee of the whole; but action was postponed to 1 July, as some delegations were averse and others were waiting instructions.

On the 10th a committee of five was appointed to draw up the Declaration: Thomas Jefferson of Virginia, John Adams of Massachusetts, Benjamin Franklin of Pennsylvania, Roger Sherman of Connecticut, and Robert R. Livingston of New York. Its composition was assigned to Jefferson by the committee; the latter and Congress made many changes, but mostly by omission rather than alteration of wording, so that the language is practically all Jefferson's. The chief cancellations were five: (1) and (2) The last two counts of his indictment of the King. (1) That he had "incited treasonable insurrections of our fellow-citizens" by promising them confiscated property. The charge was probably felt to be too weak to maintain, as well as likely to weaken the general case. (2) That he had carried on the slave-trade, and refused to allow American legislatures to suppress it. South Carolina and Georgia, which were actively carrying it on themselves, would not permit this; and too much Northern wealth had been earned by it not to make the North very willing to suppress the passage, which would impress foreign nations unpleasantly as to their sincerity. (3) Superfluous rhetoric about the incredulity of "future ages" as to the daring tyranny of the king. (4) Review of American history, denying that Great Britain had assisted in our establishment, and alleging that "submission to their parliament was no part of our constitution." It was thought best to go as little into the remote origins as possible, fixing the attention upon recent oppressions and natural rights; and above all, to ignore the existence of parliament altogether. That body is not alluded to, except inferentially as the "others" with whom the king has "combined" to subject the colonies to an alien and illegal jurisdiction. This was in pursuance of the steady contention of the colonies. (5) Attacks on the English people for re-electing "the disturbers of our harmony," and allowing their chief magistrate to perpetrate these enormities. This was struck out to avoid giving offense to the friends of the colonies in England, who in fact, by upholding Liberal leaders and even generals, saved us at last.

The Declaration was reported 28 June. On 1 July as fixed, debate was begun afresh on Lee's resolution. New Jersey and Maryland had reversed their instructions meantime. In committee of the whole that evening, nine States voted for it; Pennsylvania and South Carolina voted against it (but the latter delegates, possibly after hearing from the South, offered without instructions to vote yes if it would make a unanimous vote), Delaware was divided, and New York, as above stated, refused to vote. The "yea" Delaware delegate, McKean, sent an urgent message to the third, Cæsar Rodney, then on a political trip in southern Delaware, to come on at once; Rodney traveled 80 miles the next day, arrived in the evening, and reversed his State's vote. Pennsylvania reversed hers also; and this leaving only the abstaining New York delegates out of the voting, the South Carolina members voted yes. This carried the motion that "these united colonies are and of right ought to be free and independent States, that they are absolved from all allegiance to the British Crown, and that all political connection between them and the state of Great Britain is and ought to be totally dissolved," by 12 yeas and no negative vote. On the 3d the Declaration was taken up, and as amended was passed on the evening of the 4th. The anniversary of the fact of independence is therefore the 2d; that of the adoption of the specific document in which it was proclaimed to the world is the 4th, as celebrated. The usual statement that it was "signed" by the members at this time, however, is incorrect; it was signed by the president and secretary, whose signatures only were borne by the printed copies sent out. The journals of Congress did not enter the Declaration, but left a blank for it, which was afterward filled in and the signatures taken from the engrossed copy. On the 9th the New York convention ratified it, and the delegates gave in their formal adherence on the 15th; it was then, as entitled, "The Unanimous Declaration of the Thirteen United States of America." Six additional Pennsylvania members also recorded a formal vote on the 20th. On 19 July Congress passed a resolution that it should be engrossed on parchment, and on 2 Aug. it was signed by 53 members present; Gerry of Massachusetts, McKean of Delaware, and Thornton of New Hampshire were empowered by their legislatures to sign later, Thornton not signing till 4 Nov.

The parchment with the original signatures was deposited with the Department of State when the government was organized in 1789. In 1823 John Quincy Adams had a copper-plate facsimile made, to give copies to the signers and their heirs; but unfortunately it ruined the original. The wet sheet pressed on the face drew out the ink so that the signatures have become illegible and almost invisible, and the text partially so; and after being shown for many years only on special occasions, in 1894 it was definitely sealed up in a steel case to keep it from light and air. From 1841 to 1877 it was in the Patent Office.

The signers represented the States as follows:

New Hampshire: Josiah Bartlett, William Whipple, Matthew Thornton.

Massachusetts: John Hancock, Samuel Adams, Robert Treat Paine, Elbridge Gerry.

Rhode Island: Stephen Hopkins, William Ellery.

Connecticut: Roger Sherman, Samuel Huntington, William Williams, Oliver Wolcott.

SIGNING OF THE DECLARATION OF INDEPENDENCE. From the painting by Trumbull.

New York: William Floyd, Philip Livingston, Francis Lewis, Lewis Morris.

New Jersey: Richard Stockton, John Witherspoon, Francis Hopkinson, John Hart, Abraham Clark.

Pennsylvania: Robert Morris, Benjamin Rush, Benjamin Franklin, John Morton, George Clymer, James Smith, George Taylor, James Wilson, George Ross.

Delaware: Cæsar Rodney, George Reed, Thomas McKean.

Maryland: Samuel Chase, William Paca, Thomas Stone, Charles Carroll of Carrollton.

Virginia: George Wythe, Richard Henry Lee, Thomas Jefferson, Benjamin Harrison, Thomas Nelson, Jun., Francis Lightfoot Lee, Carter Braxton.

North Carolina: William Hooper, Joseph Hewes, John Penn.

South Carolina: Edward Rutledge, Thomas Heyward, Jun., Thomas Lynch, Jun., Arthur Middleton.

Georgia: Button Gwinnett, Lyman Hall, George Walton.

It may be noted that several of these were not members of Congress when the Declaration was passed.

The Declaration, as agreed to, follows:

A DECLARATION

BY THE REPRESENTATIVES OF THE UNITED STATES OF AMERICA IN CONGRESS ASSEMBLED.

When, in the course of human events, it becomes necessary for one people to dissolve the political bands which have connected them with another, and to assume, among the powers of the earth, the separate and equal station to which the laws of nature and of nature's God entitle them, a decent respect to the opinions of mankind requires that they should declare the causes which impel them to the separation.

We hold these truths to be self-evident, that all men are created equal; that they are endowed by their Creator with certain unalienable rights; that among these are life, liberty, and the pursuit of happiness. That to secure these rights, governments are instituted among men, deriving their just powers from the consent of the governed; that, whenever any form of government becomes destructive of these ends, it is the right of the people to alter or to abolish it, and to institute a new government, laying its foundation on such principles, and organizing its powers in such form, as to them shall seem most likely to effect their safety and happiness. Prudence, indeed, will dictate that governments long established should not be changed for light and transient causes; and, accordingly, all experience hath shown, that mankind are more disposed to suffer, while evils are sufferable, than to right themselves by abolishing the forms to which they are accustomed. But, when a long train of abuses and usurpations, pursuing invariably the same object, evinces a design to reduce them under absolute despotism, it is their right, it is their duty, to throw off such government, and to provide new guards for their future security. Such has been the patient sufferance of these colonies, and such is now the necessity which constrains them to alter their former systems of government. The history of the present King of Great Britain is a history of repeated injuries and usurpations, all having, in direct object, the establishment of an absolute tyranny over these States. To prove this, let facts be submitted to a candid world:

He has refused to assent to laws the most wholesome and necessary for the public good.

He has forbidden his governors to pass laws of immediate and pressing importance, unless suspended in their operation till his assent should be obtained; and, when so suspended, he has utterly neglected to attend to them.

He has refused to pass other laws for the accommodation of large districts of people, unless those people would relinquish the right of representation in the legislature; a right inestimable to them, and formidable to tyrants only.

He has called together legislative bodies at places unusual, uncomfortable, and distant from the depository of their public records, for the sole purpose of fatiguing them into compliance with his measures.

He has dissolved representative houses repeatedly, for opposing, with manly firmness, his invasions on the rights of the people.

He has refused, for a long time after such dissolutions, to cause others to be elected; whereby the legislative powers, incapable of annihilation, have returned to the people at large for their exercise; the State remaining, in the meantime, exposed to all the dangers of invasion from without, and convulsions within.

He has endeavored to prevent the population of these States; for that purpose, obstructing the laws for naturalization of foreigners; refusing to pass others to encourage their migration hither, and raising the conditions of new appropriations of lands.

He has obstructed the administration of justice, by refusing his assent to laws for establishing judiciary powers.

He has made judges dependent on his will alone, for the tenure of their offices, and the amount and payment of their salaries.

He has erected a multitude of new offices, and sent hither swarms of officers to harass our people, and eat out their substance.

He has kept among us, in times of peace, standing armies without the consent of our legislatures.

He has affected to render the military independent of, and superior to, the civil power.

He has combined, with others, to subject us to a jurisdiction foreign to our constitution, and unacknowledged by our laws; giving his assent to their acts of pretended legislation:

For quartering large bodies of armed troops among us:

For protecting them by a mock trial from punishment, for any murders which they should commit on the inhabitants of these States:

For cutting off our trade with all parts of the world:

For imposing taxes on us without our consent:

For depriving us, in many cases, of the benefit of trial by jury:

For transporting us beyond seas to be tried for pretended offenses:

For abolishing the free system of English laws in a neighboring province, establishing therein an arbitrary government, and enlarging its boundaries, so as to render it at once an example and fit instrument for introducing the same absolute rule into these colonies:

For taking away our charters, abolishing our most valuable laws, and altering, fundamentally, the powers of our governments:

For suspending our own legislatures, and declaring themselves invested with power to legislate for us in all cases whatsoever:

He has abdicated government here, by declaring us out of his protection, and waging war against us.

He has plundered our seas, ravaged our coasts, burnt our towns, and destroyed the lives of our people.

He is, at this time, transporting large armies of foreign mercenaries to complete the works of death, desolation, and tyranny, already begun, with circumstances of cruelty and perfidy scarcely paralleled in the most barbarous ages, and totally unworthy the head of a civilized nation.

He has constrained our fellow-citizens, taken captive on the high seas, to bear arms against their country, to become the executioners of their friends and brethren, or to fall themselves by their hands.

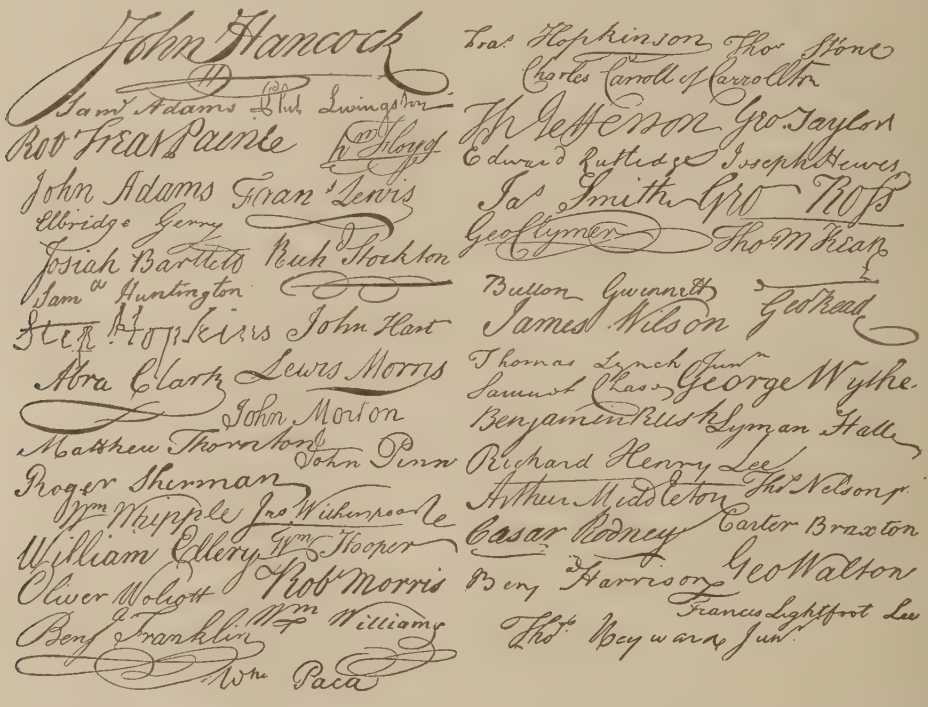
He has excited domestic insurrections amongst us, and has endeavored to bring on the inhabitants of our frontiers, the merciless Indian savages, whose known rule of warfare is an undistinguished destruction of all ages, sexes, and conditions.

In every stage of these oppressions we have petitioned for redress in the most humble terms; our repeated petitions have been answered only by repeated injury. A prince, whose character is thus marked by every act which may define a tyrant, is unfit to be the ruler of a free people.

Nor have we been wanting in attention to our British brethren. We have warned them, from time to time, of attempts made by their legislature to extend an unwarrantable jurisdiction over us. We have reminded them of the circumstances of our emigration and settlement here. We have appealed to their native justice and magnanimity, and we have conjured them, by the ties of our common kindred, to disavow these usurpations, which would inevitably interrupt our connections and correspondence. They, too, have been deaf to the voice of justice and consanguinity. We must, therefore, acquiesce in the necessity which denounces our separation, and hold them, as we hold the rest of mankind, enemies in war — in peace, friends.

We, therefore, the representatives of the United States of America, in General Congress assembled, appealing to the Supreme Judge of the World for the rectitude of our intentions, do, in the name and by the authority of the good people of these colonies, solemnly publish and declare, That these United Colo-

nies are, and of right ought to be, Free and Independent States; that they are absolved from all allegiance to the British crown, and that all political connection between them and the State of Great Britain is, and ought to be, totally dissolved; and that as free and independent States, they have full power to levy war, conclude peace, contract alliances, establish commerce, and to do all other acts and things which independent States may of right do. And for the support of this declaration, with a firm reliance on the protection of Divine Providence, we mutually pledge to each other, our lives, our fortunes, and our sacred honor.



Declaration of Indulgences, a name applied to the declaration or proclamation issued by Charles II. (1672), and also to a proclamation of James II. (1687), which were virtually acts granting liberty of conscience to all whose rights to their own methods of worship had been curtailed by the Conventicle and Five Mile Acts. These royal acts and declarations of Charles and James suspended the enforcement of the penal status which had been made against the Roman Catholics and Nonconformists, and removed the test of qualification for the holding of civil or ecclesiastical office. James II. ordered the declaration to be read in the churches, 25 April 1688. The primate and six bishops of the Church of England protested against the order, saying it was intended to benefit the Roman Catholics and that it was illegal. The king declared their act seditious libel against the crown, and sent the offenders to the Tower. Later they were tried and acquitted, 30 June 1688. On the day of their release an invitation was sent to William of Orange to come and save England from the Roman Catholics. The signers of this invitation, who wished the downfall of James II., were the Earls of Danby, Devonshire, and Shrewsbury, and the bishop of London and other bishops. (See TEST ACT.) Consult: Howell, 'State Trials'; Burnet, 'History of James II.'; Fox, 'Reign of James II.'

Declaration of Paris, 1856. Between the Napoleonic wars and the Crimean war, industrialism in European societies had made great advances over militancy; and the interests of peaceful trade, for the first time in history, were felt even by the most powerful nations to be more important than those of destruction. In opening that war, therefore, the allies — England, France, and Italy — announced their intention to respect the goods of neutrals on the sea as never before; to spare from capture either neutral goods on enemies' ships or enemies' goods on neutral ships, excepting contraband; and not to issue letters of marque for privateering. After the war, at the Congress of Paris, 16 April 1856, the contracting powers publicly declared that the unsettled condition of maritime law bred disputes and conflicts, and that a uniform policy should be established; wherefore they adopted the following «solemn declaration,» to bind whoever acceded to it, but exclude either from its obligations or its privileges those who did not: (1) «Privateering is and remains abolished»; (2) «The neutral flag covers enemy's goods, with the exception of contraband of war»; (3) «Neutral goods, with the exception of contraband of war, are not liable to capture under an enemy's flag»; (4) «Blockades, in order to be binding, must be effective — that is to say, maintained by a force sufficient really to prevent access to the coast.» This was signed by the delegates from Great Britain, France, Austria, Prussia, Sardinia, Russia, and Turkey; all other civilized maritime nations acceded except Spain, Mexico, most of the South American

states, and the United States, which refused on account of their small navies, making a resort to privateering imperative in case of war. This country, however, through its secretary of state, Wm. L. Marcy, offered to accede on condition of what was known as the "Marcy Amendment," to exempt all private property from capture on the seas; privateering would thus become objectless and cease. This was declined, and United States goods remained at the mercy of any two powers at war. On the outbreak of the Civil War, Great Britain and France recognized the Confederacy as a belligerent, and the latter at once issued letters of marque; Mr. Seward for the United States, requested permission to subscribe to the Declaration; but the former powers would only agree on condition of its not invalidating the Confederate rights. Nothing further was was ever done about it; but in 1898 the United States and Spain, both outside the Declaration, proclaimed their intention to respect it. Sections 2 to 4 are recognized international law; and as privateers are now replaced by fast cruisers in strong navies, privateering is practically though not formally obsolete.

Declaration of Rights. The Stamp Act Congress (q.v.) of 1765 published a "Declaration of Rights and Grievances of the Colonists of America," protesting against the Stamp Act, and any other effort to tax the colonists while denying them representation in the Parliament which imposed the taxes. They sent a petition to the king, and another to Parliament, claiming the same rights as were enjoyed by Englishmen born within the British Isles. The right of representation was included in these; but instead of petitioning for that right, they declared its obvious impossibility a reason why they should not be subject to taxation. The Continental Congress of 1774 (see CONGRESS, CONTINENTAL) asserted a similar claim in its declaration, as a preliminary to calling a final congress, and the Declaration of Independence begins a like assertion. The assertion of such claims was considered so vital in written constitutions by men of that age, that the strongest objection to our national one was its omission in this particular, and the storm of amendments pushed forward (see *Amendments, History of the,* under CONSTITUTION) consisted mainly of bills of rights.

Declaration of War, a public proclamation by one government in which it declares itself to be at war with another. The use of the telegraph nowadays and the wide diffusion of news, by which every incident in the events which lead to a war are instantly published, make such a formal declaration scarcely necessary, and each belligerent is usually satisfied with announcing its warlike intentions to its own subjects and to neutrals. In the United States Congress alone has the power to declare war, and when that body votes for war with a foreign power such a measure is considered tantamount to a declaration of war.

Declar'atory Act, an act passed by the English Parliament 7 March 1766, accompanying the repeal of the Stamp Act, asserting the constitutional right of the king, with the advice of Parliament, to bind the colonies by its laws and action "in all cases whatsoever." This is English colonial law still; but no attempt has since been made to enforce it against the wishes of the colonies, except where the rights of British subjects have been infringed.

Decle, dā-kl, **Lionel,** English explorer and author: b. Rocourt, St. Quentin, France, 16 May 1859; d. 1 March 1907. He was of French parentage but a naturalized Englishman. He traveled extensively in Asia, Africa, and America, was on the staff of the *Pall Mall Gazette* for several years and commanded the *Daily Telegraph* expedition from the Cape to Cairo (1899–1900). He published: 'Three Years in Savage Africa'; 'Trooper 3809,' an account of his personal experience in the French army.

Declension, the change of termination in certain classes of words, in various languages, to indicate the relation in which those words stand toward other words in a sentence. The condition of change to which the words are brought by the several terminations, are styled cases (Lat. *casus*) or fallings, the ancient Latin grammarians representing the nominative as the *casus rectus,* or upright, perpendicular case, while the rest sloped gradually down at various angles, until the ablative was a horizontal line, set at right angles with the nominative. The words subject to declension are of the classes, noun, adjective, pronoun, article. In the Latin language grammarians generally recognize five declensions, five different modes of forming cases, and to each declinable word they assign five cases namely the nominative, genitive (or possessive), dative, accusative (or objective), vocative (or interjectional), and ablative. There is also a locative case, used in the names of cities, and in such forms as humi, domi. Example, nominative *hortus,* garden; genitive, *horti sepes,* the garden's hedge; dative, *horto additum,* added to the garden; accusative, *hortum colo,* I cultivate the garden; vocative, *o horte,* O! garden; ablative, *horto disjuncta ædificia,* buildings separated by a garden. This word *hortus* belongs to the second declension: the first declension has the same five cases, for example, *ala* (wing), genitive, *alae,* dative, the same, accusative *alam,* vocative *ala,* ablative, the same save in prosodical quantity, *alā.* An example of the third declension would be *ales* (bird, winged) *alitis, aliti, alitem, ales, alite;* of the fourth declension *usus* (use), *usus, usui, usum, usus, usu;* of the fifth, *fides* (faith, trust) *fidei, fidei, fidem, fides, fide.* The examples show the process of declension in the singular number: for the plural number let one example suffice; the plural cases of *servus* (slave), are *servi, servorum, servis, servos, servi, servis:* in the plural the nominative and vocative are always of the same form; so, too, are the dative and ablative. The Greek declensions are variously classified, but most generally made three in number and the cases five, as well as two dialective locative cases. The ancient Sanskrit language has eight cases of nouns and the present language of the Finns has 15: but the languages of western Europe derived from Latin — Italian, Spanish, Portuguese, French, etc.— have dropped the declinational terminations of the Latin, and hence the Latin for "man," which is declined *homo, hominis, homini, hominem, homo, homine,* has in those modern languages the one form *homme* in French, *uomo* in Italian, *hombre* in Spanish. The ancient Germanic language, from which English is descended, had declensions; but in our language the only remnants of the an-

cient forms are, the possessive case of nouns and the objective case of pronouns, I, me; he, him; she, her; they, them. While in the Indo-European languages above cited, as well as in the Semitic tongues, the unity of the word is not destroyed by inflection, in languages like the Turkish, which are styled agglutinative, elements are added in declension which supersede or obscure the individuality of the original word.

Declination, in astronomy, the distance of a heavenly body from the celestial equator (equinoctial), measured on a great circle passing through the pole and also through the body. It is said to be north or south according as the body is north or south of the equator. Great circles passing through the poles, and cutting the equator at right angles, are called circles of declination. Twenty-four circles of declination, dividing the equator into 24 arcs of 15° each, are called hour circles or horary circles.

Declination, Magnetic. See MAGNETISM, TERRESTRIAL.

Declination Needle, or **Declinometer.** The magnetic meridian passing through any place on the earth's surface is a vertical plane whose direction is that in which a magnetic needle, free to move about a vertical axis, comes to rest under the influence of the earth's magnetic force. In general, the magnetic and geographical (or astronomical) meridians are not coincident; the angle between is termed the magnetic declination, or (in nautical phraseology) the variation. It is east or west, according as the magnetic is east or west of the geographical meridian. Any apparatus for the measurement of this angle is termed a declinometer, and consists essentially of a means of ascertaining the two necessary elements — namely, the directions, at the place of observation, of the two meridians. Permanently fixed instruments of this nature are set up in all magnetic observatories. They are generally self-registering, and record the slightest hourly, diurnal and annual variations in the declination of the magnetic needle, as well as the more violent changes due to magnetic storms.

Decline and Fall of the Roman Empire, The, a monumental work by Edward Gibbon, the first volume of which appeared in 1776, and the last in 1788. 'The Decline and Fall' has been pronounced by many the greatest achievement of human thought and erudition in the department of history. It is a history of the civilized world for 13 centuries, during which paganism was breaking down, and Christianity was superseding it; and so bridges over the chasm between the Old World and the new. It is marked by dignity of style and picturesqueness of narration. The great criticism of the work has always been upon the point of Gibbon's estimate of the nature and influence of Christianity.

Decoction, in pharmacy, a solution of a vegetable principle largely obtained by boiling in water the substance containing the principle. Inasmuch as plant drugs usually yield their constituents more readily to hot water than they do to cold water, decoctions are preferred to infusions for obtaining the active principles of plants. Decoctions are not very much used at the present time, because of their great complexity, the active principles of plants being obtained by other means.

Deco'ic Acid, or **Capric Acid,** an organic acid having the formula $C_{10}H_{20}O_2$, and occurring in the form of various compounds in butter, cocoanut oil, fusel oil (from certain sources), Limburg cheese, and the fatty matters extracted from the wool of sheep. It is soluble in alcohol and ether, but almost insoluble in cold water. It crystallizes in needles that have a faint odor suggestive of rancid butter, and is prepared by the distillation of oleic acid, or by the oxidation of that acid by nitric acid. The name «capric» has reference to the fancied resemblance of the odor to that of a goat; while «decoic» refers to the 10-carbon atoms that the acid contains.

Decomposition, Chemical, is the separation of the constituents of a body from one another, these constituents being obtained either free or in a new state of combination. Limestone, for example, is decomposed into lime and carbonic acid, oxide of mercury into mercury and oxygen, by heat. This is called simple decomposition. Definite organic bodies resemble inorganic in being influenced by similar forces, but the result in their case is somewhat different, arising from their different composition. In the case of an organic body it is possible to convert its constituents at once into their simplest states of combination, but it is also possible to obtain a large number of intermediate compounds by regulating the decomposing action. The process by which such bodies are thus decomposed is styled by chemists compound decomposition.

De Coninck, Pierre Louis Joseph, pē-ār loo-ē zhō zĕf dė kō-năńk, French genre painter: b. Meteran, Nord, 22 Nov. 1828. He was a pupil of Leon Cogniet, and won the second prize of Rome in 1855, taking medals in 1866 and 1868 and a third class medal in 1873. Among his works are: 'Eva and Uncle Tom' (1857); 'Woman Bathing at Capri' (1863); 'Torture of Queen Brunhaut'; 'Ballet Girl Resting' (1864); 'Christ Blessing Little Children' (1865); 'Two Friends' (1866); 'Lavandara' (1867); 'The Ordeal' (1869); 'Little Charmer' (1870); 'The Ring' (1873); 'Kittens' (1874); 'Pastorella'; 'Hare in Trap' (1881); 'The Trappist.'

Decorah, dē-kō'ra, Iowa, city, county-seat of Winneshiek County; situated near the northeastern corner of the State on the Iowa River, about 30 miles from its mouth, and on the Chicago, Milwaukee & St. Paul Railroad. The city has manufactures of paper, flour, and agricultural machinery. The water-plant is owned by the city. A Norwegian Lutheran College and the Breckenridge Institute are located here. Pop. (1900) 3,246.

Decorated Style, the second style of pointed (Gothic) architecture, in use in Great Britain from the end of the 13th to the beginning of the 15th century, when it passed into the Perpendicular. It is distinguished from the Early English, from which it was developed, by the more flowing or wavy lines of its tracery, especially of its windows, by the more graceful combinations of its foliage, by the greater richness of the decorations of the capitals of its columns, and of the moldings of its doorways and niches, finials, etc., and generally by a style of ornamentation more profuse and naturalistic, though perhaps somewhat florid. The most dis-

tinctive ornament of the style is the ball-flower, which is usually inserted in a hollow molding. The Decorated style has been divided into two periods, namely, Early or Geometrical Decorated period, in which geometrical figures are largely introduced in the ornamentation; and the Decorated style proper, in which the peculiar characteristics of the style are exhibited. To this latter period belong some of the finest monuments of British architecture. See ARCHITECTURE.

Decoration Day, a holiday observed in many States as an occasion for decorating the graves of soldiers killed in the Civil War, whether in national or private cemeteries. The custom of "Memorial Day" (as it is otherwise called) originated with the Southern States, and was copied scatteringly and on different days in some Northern States,— all in the spring, for natural reasons. On 5 May 1868 Gen. John A. Logan, then commander-in-chief of the Grand Army of the Republic, issued an order appointing 30 May of that year for Grand Army services in so decorating graves — choosing that day possibly as being the date of discharge of the last Union volunteer of the War. The States which observe the day have adopted it singly, there being no national law on the subject.

Decoration, Interior, in the United States. During the last quarter of the 19th century much attention was excited in the Atlantic coast cities by the attempts, which began to be seen and heard of, at rich decoration of houses and churches. There had been, before that time, little of consequence; the plastered adornments of the old colonial houses still existed, and these were sometimes copied, clumsily or otherwise; and there were a few public buildings in which an historical painting or two was put up; but decoration in a larger sense had hardly been undertaken.

Five years after the close of the Civil War some architects in New York and Boston began to try to increase their own charge of the dwelling-house in hand by making careful original designs for interior woodwork, with stairs and fixed sideboards and chimney-pieces, and even in the way of wall-painting of decorative character. All this work could be done from drawings made in the architect's office, always supposing that he had surrounded himself with draughtsmen of good capacity in other than merely mechanical drawing. Thus, excellent wood-carving, in solid oak plank or in delicate panels of holly or mahogany was carried out even to the adornment in a very complete fashion of large staircases and entrance-halls. The painting, too, though limited to scrolls and floriated work, was in the way of considerable artistic development and promised well. The exhibition at Philadelphia in 1876 increased the interest in these with all the other decorative arts, by spreading further West and South the knowledge of their existence and of the possibilities connected with them. The result of this was seen in the establishment of studios, and also of more commercial establishments intended for the making and application of interior decorations of all sorts — from costly mural paintings and brilliant stained glass down to the simplest carved and molded mantlepieces and dadoes. The difference between the two classes of establishments should be made clear, for the establishment devoted to interior decoration, like that devoted to upholstery and the making of furniture is of necessity commercial in its aims, and will, as a general thing, sell to the buyer what he demands except in so far as the persuasions of the salesman or superintendent can lead him to adopt another view than that which he held originally. The atelier or studio, on the other hand, is the workshop of an artist who, in his capacity as artist, undertakes to give nothing which he does not approve. Although some of the more commercial establishments are directly controlled by able and conscientious artists, the distinction stated above is still to be maintained, and the test is that such a studio as described above will offer nothing for sale, will have nothing that could be sold, will undertake a piece of decoration under the usual limitations and with the usual desire to please the owner of the house, but also limited by the artists' conditions as to what is right.

The establishment of these workshops of different kinds very soon put out of their course the few architects who had desired to undertake such work themselves. When a painter or sculptor would undertake the richer decorations of certain parts of the house, it was natural to leave the less elaborate ones also to him. Only a few of the offices of architects will now undertake decorative work beyond the very simple full-size drawings made for plaster ceilings and molded door-trims. Another influence, also, has appeared — the clever and energetic work done by the larger upholsterers in the great cities, some of whom undertake decoration on a large scale. The student of such things should not lose sight, however, of the essential distinction between work which is done in the commercial way with the single purpose of pleasing the buyer, and that which is done in the artist's way with the primary purpose of being as good as possible within the limits set by the buyer.

The larger and more monumental paintings of which there is so much to be told, began with the decorations by John LaFarge of Trinity Church in Boston, and the paintings by William Morris Hunt in the Capitol, or State House, in Albany, N. Y. These are nearly contemporaneous. Trinity Church having been recently built by H. H. Richardson, LaFarge was set to work in 1876, having several assistants, since well known as decorative painters on their own account. The interior of the church is filled with paintings, chiefly of figure subjects, of which subjects the best known are 'Christ and the Woman of Samaria,' and 'Christ and Nicodemus.' The work of the whole decoration is chiefly a matter of warm color. Mr. Hunt's paintings in the capitol were singularly unfortunate, for, having been painted on the wall directly, they were soon injured by the unequal settlement of the building and then were concealed entirely by the changes which had to be made. They were finished at the beginning of 1879 and in 10 years from that time were lost to sight forever. Their subjects were emblematic and metaphorical in a large way, 'The Flight of Night' and 'The Discoverer.' The purpose of Hunt in painting his decorations directly upon the wall deserves all honor, and it is greatly to be wished that those who have followed him in producing the important mural paintings of America would have followed the same rule. The process of *marouflage,* by which

the artist paints upon a great canvas which is afterwards pasted upon the wall, has many advantages; but it should certainly be arranged so that the work on this canvas should be done in the room to be adorned by it, and in the light and with the surroundings which are to be its permanent conditions.

The Albany capitol had been put into the hands of an artistical commission consisting of Leopold Eidlitz, H. H. Richardson, and Frederick Law Olmsted. This was done about 1874, and after a short interval of time the work still needing to be done upon the building was divided between the two architects, Mr. Eidlitz taking the north side on Washington Avenue, with the assembly chamber and its accessories, and Mr. Richardson the south side, with the senate chamber. The interior decorations were very different in character each from the other, but each was carried out in a very elaborate fashion without much reference to the original design of the building, which, indeed, was almost entirely changed in character from the third or principal story upward. Richardson's decorations were extended afterwards to include the great staircase at the western end of the building, the elaborate hall and annexed chambers of the Court of Appeals and the State Library. Great originality was shown in these; the woodwork of the galleries, the screens and dwarf partitions, the tribunes and desks for presiding officers and judges, the great chimneypieces and the ceilings were treated with extraordinary vigor and intelligence, and they remain among the most instructive work of independent thinking in design that has been done in America. With the aid of certain sculptors who devoted themselves to this decorative work, among whom should be named John Francis Brines, the elaborate stone-built staircases received an architectural decoration closely akin to that of the porches of entrance; elaborate leafage of the Byzantine type, especially invented and developed for the occasion, was combined with heads (either portraits or ideal portraits) of prominent natives of New York, and ideal heads were introduced in other parts of the work. There was no mural painting done in the capitol other than the pictures by Hunt, mentioned above, nor was there any stained glass used there.

About 1878 John LaFarge contracted with Cornelius Vanderbilt for a carved ceiling in Mr. Vanderbilt's house in New York; the smaller house which was the nucleus of the vast palace that now stands at Fifth Avenue and 57th Street. This ceiling was then carried out in the richest possible way. There was much decoration in relief, ideal figures, and the panels containing them framed and enclosed by molded and carved beams and cross beams so that each panel was treated nearly like a caisson. But the peculiarity of this was that the reliefs were all in polychromy and that very rich materials were used to produce the color effect desired. Glass, in masses (colored and cast for the purpose), bronze (and that of many tones and shades), marble, ivory (sometimes stained), mother-of-pearl and even silver were used in these extraordinary decorations. The same room contained a mantelpiece with a high structure above it of pilasters carrying a special entablature, and all this was inlaid with mother-of-pearl in a very brilliant way. The designs were singularly free from the modern American fault of following old styles, even to the extent of copying too closely special examples of these styles. It would be impossible to say that any ancient style suggested the treatment adopted.

By 1880 it had become rather common for architects, when employed to build the very costly houses of the new-made millionaires, to recommend to their employers the sculptors and mural painters who could fill these private palaces with decorative art of the highest class. The Villard house in New York, afterward belonging to Whitelaw Reid, was one of the earliest of these, and this contains what are perhaps the finest mural paintings that LaFarge has done: the two lunettes, 'Music' and 'The Dance'; but very soon this was rivalled by houses built in the same city and in Boston and Chicago. George B. Post of New York has been especially successful in obtaining for the finer adornment of his buildings the work of the best men in both the great arts of expression. He was the architect of the Cornelius Vanderbilt house in its former and in its later and much enlarged form, and also of the house of Collis P. Huntington, and had charge of the decorative re-arrangement of the Lawyers' Club in New York and of banking houses in different parts of the country.

There was another singular manifestation of the disposition to adorn buildings of residence, for the great hotels began to find it necessary to pay for costly pictures to adorn their reading and lounging rooms, their dining-rooms and smoking-rooms, and the like. Mr. Hardenberg's hotels showed this tendency among the earliest, for in the Waldorf there is a really splendid ceiling by Will H. Low, representing 'The Triumph of Venus,' and many lunettes and smaller wall-paintings. In the Astoria, adjoining the Waldorf, there are other similar decorations. In the Manhattan there is a long and broad frieze of painting by Charles Y. Turner, representing 'The Triumph of Manhattan,' and in the café a landscape decoration by Frederick Crowninshield, running all around the large room and showing above the high dado of light-colored wood. This last named achievement is a wonderful success in that while the solidity of the wall is not destroyed by the treatment, there is still a far-away look of the Roman campagna with the distant mountains, while in the foreground life-size figures seem to look over the solid wall formed by the wooden dado. Mr. Crowninshield has carried out and enlarged the same style of decoration in his paintings of a certain restaurant at the top of a large department store on 6th Avenue, New York, and this is the most remarkable instance that we can name of the willing acceptance of so elaborate and so purely artistic a decoration in a building devoted to purely commercial purposes.

Decoration other than painting and other than sculpture of human figures has been used in the "office buildings," or great structures built in the business quarters of the cities and rented out in separate rooms or suites of rooms to lawyers, brokers, agents and business men of all sorts, other than the keepers of shops and stores. These buildings since 1875 have been high, fitted with elevators, and solidly built, and since 1885 have been commonly constructed on the "steel cage" principle, which allows of buildings of any height and of rapid construction. This has been the era of the "sky-scrapers,"

Arabic, Byzantine, and European Designs of the 15th and 16th Centuries.

which range from 16 to 24 stories, and require a great number of elevators in proportion to their size. A great deal of elaborate work in the way of marble linings, floors of mosaic, of gray and white and black tesseræ, and, unfortunately for safety, highly wrought woodwork in the way of door-trims and window-trims and mantelpieces have been used. There has been some slight attempt to carry out decorative designs in stucco and similar varieties of what may be called in a general sense, plastering. This art has, of course, indefinite possibilities, and there is hope that another generation of artists will see in marble the material for the lining of walls near the foot and where they are most exposed to injuries, while above a certain line the easy method of modelling bas-reliefs in cement or stucco and then painting them in polychromy will be followed.

The Chicago World's Fair, held in 1893, gave much employment to the mural painters and to the sculptors of America during the three or four years preceding its opening. These decorations must not detain us here, because they all vanished with the occasion. It is, in a way, a pitiful thing that the very important paintings of the cupolas and lunettes of those buildings disappeared within a year from the time of their completion.

There are certain public buildings in which it will surprise the student to find very splendid and interesting work, especially in mural painting, where he would certainly look for no such adornment. Thus the Criminal Court-House in Centre Street, New York, has received certain mural paintings by Edward Simmons, ordered and paid for by the Municipal Art Society, and these pictures consist of a central composition of 'Justice,' and two side pictures arranged like a frieze, 'The Fates,' and 'Liberty, Equality and Fraternity.' These pictures are peculiar in being nearly monochromatic, so planned, no doubt, because of the necessity of matching their tones and values with the surrounding white walls — for it was hardly hoped that the whole room could be enriched with color. On the other hand, the building on Madison Square, New York, appropriated to the State Supreme Court, Appellate Division, has its principal rooms and its hall of entrance adorned according to an elaborate general scheme, involving much variety of coloration and many large and fully realized paintings. These are by E. H. Blashfield, Henry Oliver Walker, Kenyon Cox, and many others. This building is also adorned as to its exterior with elaborate sculpture, statues, and high reliefs.

About 1880 was finished the remarkable painting which fills the eastern wall of the Church of the Ascension in New York city. This is the largest mural painting by LaFarge and one of the largest in America. Its subject is that from which the church is named, and the ascending Saviour is accompanied by a glory of angels, while a crowd of disciples watch from the earth below. The value of the picture is in its delicate and melting color, and the fact that this richness of hue and tone has in no way injured the wall as a part of the building. The picture does not count as a break in the solid structure, or as a window through which is seen the external world. The same artist painted in the Church of the Incarnation, the Church of Saint Thomas, and the Church of the Paulist Fathers, all in New York city. Robert Reid, of New York, has painted in the Church of the Paulist Fathers and in the Church of the Incarnation. At Bowdoin College, in Maine, the elegant little building occupied by the Walker Art Gallery has been decorated by certain paintings, of which those by Vedder and LaFarge are peculiarly important. Some very recent dwelling houses have received splendid mural decorations, among others two at least which have admirable ceilings by Will H. Low. One of these ceilings, in a round drawing-room at a corner of Fifth Avenue, is occupied by a circular picture, of which the subject, put into the title 'Golden Autumn,' is in reality a group of three draped female figures engaged in gleaning wheat from the field and winnowing in the simple old-fashioned way with a sieve.

About 1895 the Congressional Library in Washington was nearly completed, and was then put into the hands of Edward Pearce Casey, of New York, in order that he might administer the elaborate decorations proposed. This building was then adorned with mural paintings by a score of able men, and also by sculptures in the halls and stairs, in this last respect being almost alone in American public buildings. It may be noted here that sculpture has not been employed very freely in interior decoration in America. The great chimney-pieces of hall and library have been adorned with figures, even of life size; and the churches contain many tombs and memorial slabs to which relief sculpture adds a charm, but there is little more. The architect in charge of the Library was fortunately ready to improve his opportunities. The sculptures of Philip Martiny, carried out in a purely decorative way in the lower halls and the great stairs, are singularly appropriate to their place. They include bronze newel statues carrying torches which are fitted with electric lights, and long stretches of parapets very delicately carved with cupids and flowers. The sculptures of the late Olin H. Warner are few, but they are of singular importance, especially a pair of figures in high relief filling the spandrils of the archway leading to the great reading-room — figures of a young and an older student. Herbert Adams furnished a series of figures of about half life size carrying torches. But of all the sculptures of the interior by far the most important are the really surprising statues in the great reading-room, which forms a wide and lofty octagon. Here there are eight colossal symbolical statues worked into the architecture of the room — adorning the abutments of the great vaults — and these are by first-rate men, J. Q. A. Ward, Daniel C. French, Paul W. Bartlett, John Flanagan, and others. On the railing of the high tribunes forming a kind of second story to each recessed side of the octagon are ideal portrait statues of heroic size cast in bronze, and these, though placed too high for the best examination from below, and too distant from him who ascends the high tribune and looks across the rotunda, are still of such remarkable importance that they deserve minute study. Herodotus is by Daniel C. French; Bacon is by John J. Boyle; Patrick Henry is by Herbert Adams; Beethoven is by Theodore Baur; Fulton is by Edw. C. Potter; Shakespeare is by Frederick MacMonnies; Chancellor Kent is by George E. Bissell; Gibbon, the historian, is by Charles H. Niehaus; Michelan-

gelo is by Paul W. Bartlett. These 16 statues are, then, of singular interest, and casts and photographs of them should be within reach of everyone. The painting of this large building has been carried out with the most elaborate care, and it has been helped by mosaics of ceilings and vaults, as well as of floors. On the ground floor there are long corridors which go off to the north and south, with their ceilings vaulted in cupolas and pendentives; and the entrance hall itself, from which these corridors start, is divided by piers into a northern, a southern, and a western vestibule, each vaulted, with the vaults adorned in mosaic and the lunettes painted by Charles Sprague Pearce and H. O. Walker. Elihu Vedder has a special apartment behind the stair and leading to the great reading-room. stair and leading to the great reading-room; a lobby, which he has filled with allegorical paintings of Good Government, Bad Government, Anarchy, etc.; and near this a great wall mosaic, 'Minerva, the Protectress of Civilization.' Edward Simmons has one of the long corridors, in which he has filled 20 lunettes. The eye of the dome which crowns the great rotunda of the reading-room has a broad band carried around it filled with admirable symbolical figures by E. H. Blashfield. It is impossible to continue the examination of this vast collection of mural paintings, for this whole article might be devoted to it. A certain amount of blame has been thrown upon the building for its vividness of color, the constant play and change of contrasting effects; but it is the experience of every student of art who has given time to this strange gallery of art that its worth grows upon the student continually.

The public library of the city of Boston is alone in America in having a great mural painting by Puvis de Chavannes, the chief of modern decorative artists in color. And yet coloration is not the chief object of Puvis, whose work is too severely restrained by architectural considerations — is too honestly and frankly subordinated to the necessities of wall decoration, to be brilliant in color. What was said above about LaFarge's pictures in the Church of the Ascension is to be taken in singular contrast to what is said here about the great painting at the head of the stair in the Boston public library, for here warmth and brilliancy of color are eschewed, and the exquisite result bears out the great Frenchman in his choice of method. There are smaller panels by the same artist on the other walls of the staircase halls. The large room devoted to the giving out of books, in the second story of the library, is painted by Edwin A. Abbey. But here the result has been very different and in no way equally valuable. With the exception of Puvis' picture, the finest thing about the library, and the most important mural painting, probably, in America, is the Sargent at the south end of the hall in the third story, where the great staircase comes to an end. A painting at the north end of the hall was completed about 1895, and this excels in power, in magnificent sweep and force of workmanship, but it cannot compare with the painting at the south end in perfect fitness to the place and to its requirements. That picture at the south end of the room deals with the Christian faith as an established and accepted piece of ecclesiology and is divided into three chief parts, so that the whole wall at the end of the gallery, with no separation of the lunettes from the square wall below, is filled with the composition, superb in line and in color. The other walls of the same gallery are awaiting their decoration.

Some mural paintings of great importance date from the early years of the 20th century. Edwin H. Blashfield has painted, for the court-house of Baltimore, a picture 34 feet long and divided into three principal sections, to commemorate the surrender of his commission in the army by George Washington. For the same building Charles Y. Turner painted as a decoration 'The Barter with the Indians for Land in Southern Maryland,' and these two great pictures were completed in the autumn of 1902. Mr. Turner has now in hand another picture for the same court-house, 'The Burning of the Peggy Stewart at Annapolis in 1774,' this being one of the protests against the tax laws and in all respects equivalent to the famous Tea Party of Boston. For the same building Mr. Blashfield has completed (May 1904) 'The Edict of Toleration of 1649,' Lord Baltimore presenting his people to the personified virtues, Wisdom, Justice, and Mercy. For the Citizens' Bank of Cleveland, Ohio, Mr. Blashfield has completed a painting 27 feet long, symbolical of the uses of wealth. The State Capitol of Minnesota, in the city of Saint Paul, is to contain mural paintings by John LaFarge, Edward Simmons, H. O. Walker, Kenyon Cox, E. H. Blashfield, and Elmer Ellsworth Garnsey. There will also be paintings, framed and hung in the building, by Frank D. Millet and Douglas Volk.

RUSSELL STURGIS,

Decorations. See ORDERS AND DECORATIONS.

Decorative Plants. The plants used for decoration may be said to include not only species cultivated for purely ornamental purposes, but many others which have important uses. Thus the chestnut-tree, which in the forest is valued for its timber, might in a park have a distinct value for its pleasing form, attractive foliage, and long, graceful catkins. Similarly, the apple-tree when in flower can scarcely be rivaled as a lawn specimen. It is attractive also in its general form and when laden with red or yellow fruit. In the same way the common garden asparagus is a particularly ornamental plant, not only in itself, but to conceal the unsightly stems of such tall-growing plants as hollyhocks, or to act as the background for such brilliant flowering plants as scarlet sage (*Salvia splendens*). Even some of the weeds can be made to do signal decorative duty, as when a large-leaved dock is used to give tone to a group of otherwise characterless foliage, or when a mullin is allowed to rear its flowering stem like an exclamation point in a similar group. Thus it is evident that there is no fast line of demarkation between decorative and useful plants and kation between decorative and useful plants and useless plants, since the purpose for which the specimen is grown determines whether it is decorative or not.

But setting aside such utilitarian cases as forest and fruit trees, shrubs, vegetables, and weeds which may occasionally serve as ornamental subjects, decorative plants may be variously classified as to their place of growth, whether out of doors or under glass; as to their character of growth, whether trees, shrubs, vines, or herbs, etc.; as to their duration.

Alloplectus peltatus

Salvia sclarea

whether annual, biennial, perennial, etc.; as to their attractive parts, foliage, flowers, fruit, bark, etc.; as to their season of special attractiveness; and in many other ways. For present discussion, however, the place where the plants are utilized and the kind of plants will be considered.

Unquestionably, trees constitute the most important group, since apart from any specially attractive individual feature they form the background or framework of all but the smallest garden pictures. In planting any place of considerable size, trees and their positions are always considered first; the shrubs, which bear a similar relation in small places, the perennial and annual herbs, being considered in the order given. Hence the choice and placing of trees deserves the most careful attention of the planter. Among the species attractive for their foliage and general form are the beeches, birches, lindens, cedars, pines, and spruces; and among those which bear conspicuous flowers are various magnolias, the hardy catalpas, especially *C. speciosa,* which attains a large size and bears large leaves and a profusion of big, white blossoms. The horse-chestnut (*Æsculus hippocastanum*), with its large panicles of white flowers tipped with red, often attains 50 feet in height and is very popular as a lawn and street tree because it casts a dense shade. Other popular flowering species are *Paulownia,* tulip-tree (*Liriodendron*), golden chain (*Laburnum*), and locust (*Robinia*). Of the tender exotic trees which are cultivated only in warmer climates, perhaps few surpass the *Rhodoleia,* a small southeastern Asiatic tree with evergreen leaves and heads of four or five bright pink camellia-like flowers.

Prominently in front of the trees, or upon the margins of ponds in which their beauties may be reflected, the foliaceous and flowering shrubs may be placed in groups or singly. There is a vast list of these, especially of the blossoming kinds, but such as are perfectly hardy in any locality will usually be most satisfactory, since they need less attention as a general rule than specimens that must be coddled. Among the generally admired foliaceous species, the dwarf pines, spruces, and other conifers, willows, maples — especially the Japanese varieties — are perhaps most frequently planted; and among the flowering kinds, the barberry (*Berberis*), dogwoods (*Cornus*), spindle-tree (*Euonymus*), *Deutzia, Forsythia, Hydrangea,* lilac, *Rhododendron,* and *Spiræa* are general favorites of easy culture. In southern Florida and in parts of California many exotic species have been introduced. One popular shrub is the bottle-brush (*Collestemon*), an Australian evergreen with dense cylindrical spikes of usually red flowers. Some of these tender species are grown in greenhouses in cool climates, as are also various species of *Alloplectus,* tender tropical evergreens with yellowish tubular flowers.

Among the shrubs, partially disclosed and yet seemingly hidden, may be displayed the hardy perennials, such as *Yucca,* with its spire of creamy white blossoms which brighten sombre nooks, or the plume-poppy (*Bocconia cordata*), whose feathery panicles add airiness to rather heavy masses of foliage. Certain hardy perennials are, however, often planted in borders, for which purpose larkspur (*Delphinum*), foxglove (*Digitalis*), *Pentstemon,* sea-holly (*Eryngium*), peony, and the spiræas are general favorites.

In the South, in California, and in northern greenhouses there is probably no vine so easily grown and so generally satisfactory as the *Bougainvillea.* The flowers are small and insignificant, but the large bract which subtends each blossom is usually bright red or purple. Since the plant quickly covers large areas and is very floriferous, it forms a brilliant covering which continues attractive often for months. It is largely used for training over arbors and piazzas in warm climates. Another popular climber of the same class (tropical) is the crab's-eye vine (*Abrus precatorius*), which grows about 10 feet tall, bears white, pink, or rose-colored flowers, and bright scarlet seeds, each with a black spot. It is often called weather-plant from its supposed powers of indicating the future state of the weather.

Among the host of plants grown under glass, one of the most striking is the gigantic Abyssinian banana (*Musa ensete*) with paddle-shaped leaves often 12 feet long by 3 feet broad, and with leaf stems as thick as a man's fist. Another noticeable though rather insignificant-looking plant is the fragrant olive (*Olea fragrans*) with a profusion of deliciously perfumed tiny cream-colored flowers. Probably the most important group consists of the palms which are so popular as pot and tub plants in decorations at church festivals, social functions, etc., and some of the smaller species of which, especially *Cocos weddeliana,* are largely used in table adornment. There are also many plants, such as *Coleus vriesia, Dieffenbachia,* and the ferns which are specially attractive for their odd or graceful foliage. The orchids, such as *Cattleya, Lælia, Dendrobium, Cyprepedium, Odontoglossum,* and many others are grown for their flowers, their foliage being usually unattractive. Several species of *Euphorbia* are very popular, one, generally known as "poinsettia," being widely used for the whorl of scarlet leaves surrounding the insignificant greenish flowers, while another (*E. splendens*), known as "crown of thorns," is grown more because of its oddity and on account of the legend as to its use in the persecution of Jesus than because of its intrinsic beauty. This legend is also connected with several other spiny plants. The most important species mentioned above will be found discussed either under their popular or generic names. See also Floriculture; Forestry; Horticulture; Landscape Gardening.

De Cos'ta, Benjamin Franklin, American clergyman and writer: b. Charlestown, Mass., 10 July 1831; d. New York 4 Nov. 1904. He entered the ministry of the Episcopal Church and was rector of the Church of St. John the Evangelist in New York 1863–99. In the year last named he became a Roman Catholic. Included in his many publications are: 'The Pre-Columbian Discovery of America by the Northmen' (1869); 'The Moabite Stone' (1870); 'The Rector of Roxburgh,' a novel under the pen-name of William Hickling (1873); 'Verrazano the Explorer' (1880); and 'Whither Goest Thou?' (1902). He became president (1884) of the first branch of the White Cross Society, of which he was the organizer.

De Coster, Charles Théodore Henri, shärl tă-ō-dōr ŏn-rē dė kōs-tā, Belgian poet: b. Munich 20 Aug. 1827; d. 7 May 1879. His first poetical composition was 'The Owls' Mirror'; then followed 'Flemish Legends' (1856); 'Brabant Stories' (1861), a spirited description of lowly life; 'The Wedding Tour' (1872); and the little comedy 'Jenny' (1865).

Decourcelle, Pierre, pē-ār dė-koor-sĕl, French dramatist: b. Paris 25 Jan. 1856. His first work was the five-act drama 'The Ace of Clubs,' written for Sara Bernhardt, which had an extraordinary success. Then followed a succession of comedies, dramas, comic-opera libretti, and dramatizations of popular novels, written by him individually or in collaboration with other authors; among them: 'The Amazon' (1885); 'Madame Cartridge'; 'The Abbé Constantin' (founded on Halévy's story); 'The Man with the Broken Ear' (after About). He wrote also a sensational novel, 'The Gray Hat' (1887), and 'Fanfan' (1889), both of which were received with great popular favor.

Decoy, a place into which wild fowl are decoyed in order to be caught. A decoy pond is kept only in a secluded situation. Several channels or pipes of a curved form, covered with light hooped net-work, lead from the pond in various directions. The wild fowl are enticed to enter the wide mouth of the channel by tamed ducks, also called decoys, trained for the purpose, or by grain scattered on the water. When they are well into the covered channel they are surprised by the decoy-man and his dog, and driven up into the funnel net at the far end, where they are easily caught. There are differences of detail, but the general features of decoys are the same.

Decree, in general, an order, edict, or law made by a superior as a rule to govern inferiors. In law it is a judicial decision or determination of a litigated cause. The decree of a court of equity or admiralty answers to the judgment of a court of common law. In ancient history it signified a determination or judgment of the Roman emperor on a suit between parties. In the former German empire the resolutions of the emperor, declared to the estates of the empire, were called decrees. The old name of royal orders in France was *ordonnances* or *lettres.* The national convention, while it possessed sovereign power, used the expression, *La convention nationale décrète;* but the imperial government used the words imperial decree, for instance, in the famous decrees of Berlin and of Milan. In ecclesiastical history the term is especially used with reference to the authoritative decisions of councils. See BERLIN DECREE; MILAN DECREE.

Decrepita'tion, the crackling noise which several salts make when suddenly heated, accompanied by a violent exfoliation of their particles, due to the sudden conversion into steam of the water which is mechanically enclosed between the solid particles of the body; or to the unequal expansion of the laminæ of which the mineral is composed in consequence of their being imperfect conductors of heat. The true cleavage of minerals may be often detected in this way, for they fly asunder at their natural fissures.

Decre'tals, The (*Decretales*), (1) the second part of the Canon Law or *Corpus Juris Canonici* (q.v.). It contains in five books the papal constitutions, laws, and decisions from the time of Gratian's *Decretum,* 1151 to 1234, when this second part was compiled by St. Raymond of Pennafort at the order of Gregory IX. The subject matter of each of the five books is expressed in the mnemonic hexameter verse:

Judicium, judex, clerus, connubia, crimea;

meaning that the decretals of the first book relate to the constitution of tribunals, those of the second to the duties of judges, those of the third to the rights, privileges, etc., of the clergy, those of the fourth to marriage, and those of the fifth to offenses against the Church's laws.

(2) *The False Decretals,* or the *Pseudo-Isidorian Decretals* are a collection of decretals, gathered ostensibly by Isidorus Mercator, in the middle of the 9th century. The exact date and authorship of the document are not known; but as a canon of the Council of Paris (829) is quoted, the collection must have been made later than the year in which the council was held. Some modern historians claim that the collection was well known before the year 845. Rheims and Mayence are each given as the place where the work of collating and writing was done. The writer called himself Isidore Mercator, and in some MSS. «Peccator.» (The writer may have had in mind the great St. Isidore, who had previously made a compilation of decrees and canons.) Historians claim that the name was, like the decretals, false. The collection was received at first as authentic. To have at hand and in convenient form all the decrees of councils and the decretal letters of deceased popes, was indeed a boon to be highly appreciated. It was known that letters and documents existed other than those to be found in any collection, so when this collection made its appearance, it was regarded as worthy of praise and thanks.

The collection opened with the 50 apostolic canons received and collected by Dionysius Exiguus; and these were followed by a number of decretal letters said to have been written by early popes, from Clement of Rome, one of the apostolic fathers, to Melchiades, at the end of the 3d century. None of the letters claimed to have been written by popes are genuine. Decrees purporting to have been promulgated at the councils of Nicæa and Seville, came next. Some of these are true. Then came other letters said to have been written by popes, beginning with Sylvester (who succeeded Melchiades) and ending with Gregory the Great. One letter in this collection, credited to Pope Siricus (384–399), is genuine. The last part of the compilation is a copy of the canons passed by Gregory II. (731) at the council held in Rome. Möhler, the German theologian, in commenting upon the fact that these decretals were at first so well received, almost without a dissenting voice, says: «Pseudo-Isidore seized exactly that in his own age which corresponded to the wishes of all the higher and better order of men. Thence it was that this legislation was so joyfully received. No one suspected anything false, because it contained so much that was weighty and true. If we examine carefully these invented decretals, and try to characterize their composer in accordance with their general import and spirit, we must confess that he was a very learned man, perhaps the most learned man of his time, and at the same time an ex-

tremely intelligent and wise man, who knew his age and its wants as few did. Rightly he perceived that he must exalt the power of the center—that is, of the Pope—because by that way only was deliverance possible. Nay, if we would pass an unconstrained judgment, we may venture even to call him a great man.»

At the time of the appearance of the collection and for centuries afterward, its contents were so in harmony with the leading thoughts of Europe that the whole was accepted without thorough examination or criticism. Nicholas of Cusa, an able theologian of the 15th century, was the first one to express a doubt of the genuineness of the collection, and to advance proofs of the truth of his assertion. The Magdeburg Centuriators began investigations, and then many Protestant critics followed the same line of study, arriving at the same conclusion as that of Nicholas of Cusa. Finally, when the Isidore decretals were examined critically by theologians and historians, it was ascertained that nearly all were forgeries, and that anachronisms and blunders existed in large numbers. Phillips, Hefele, Möhler, and others show that in the whole collection there was nothing against the supremacy of the Pope, as had been advanced by some writers; that the letters said to have been written by popes were nearly all false, also that several of the spurious documents existed prior to the 9th century and may have been used in good faith by the compiler.

Consult: Hefele; Paulus Hinschius, 'Decretales Pseudo-Isidorianæ'; Dumont; Möhler; Phillips; Knust; Rosshirt; Walter; Spittler; Wasserschleber; the brothers Ballerni.

Decu'riones, magistrates in the provincial *municipia* of the Roman state, corresponding to the senate at Rome. Originally the popular assemblies had the sovereign power in the *municipia,* and conferred the executive authority upon the decuriones. They consisted at first of 10 men, but in later times they frequently numbered more, and sometimes even amounted to 100. Each *curia decurionum* was presided over by two members who were called *duumviri,* and whose powers within their *municipium* resembled those of the Roman consuls during peace. Under the republic the whole administration of the internal affairs of their respective cities was in the hands of the decuriones, but after the establishment of the empire they exercised nearly all the circumscribed rights of the communities, though finally they were little more than receivers of taxes. The decuriones were created by election, and each decurio was required to be at least 25 years old, and to possess a certain annual income. Their election took place on the kalends of March.

Dedekind, Friedrich, frēd'rĭh dā'kĭnt, German poet: b. Neustadt on the Leine 1525; d. 27 Feb. 1598. His principal work is 'Grobianus' (1549), a satire in Latin distichs against drunkenness and obscenity; it had wide circulation, and was translated into German, Dutch, and English. He wrote two dramas having a religious polemic end in view: 'The Christian Knight'; and 'The Converted Papist.'

Dedham, Mass., town, county-seat of Norfolk County; on the Charles River about 25 miles from its mouth, and on the New York, New Haven & Hartford Railroad. The town is one of the oldest in the State, the first settlement within the town's limits, having been made in 1635. The town is noted as having established the first public school in America supported by a general tax (1644). It has considerable manufacturing interests in cotton, wool, and clay, but its chief interests are connected with Boston, of which it is practically a suburb. The prominent buildings of the town are the Historical Society building, the county buildings, including the courthouse, jail, and house of correction, and a public library. The government of the town is administered by means of town meetings. Pop. (1900) 7,457. Consult: The town records; Man, 'Historical Annals of Dedham.'

Dedication, Feast of the, an annual Jewish festival in commemoration of the purification of the Jehovah Temple in Jerusalem after it had been used for pagan worship by the Syrians and later recovered by Judas Maccabæus. The temple had been dedicated in B.C. 168 to the worship of Zeus Olympius by the then ruler of the land Antiochus IV., Epiphanes, and an altar to the god set up on the altar of burnt offerings. When Judas Maccabæus in B.C. 164–5 drove the Syrians out of Jerusalem, he removed the pagan altar, rebuilt the altar of burnt offerings and purged the temple. It was then rededicated to Jehovah with a series of festivals that covered a period of eight days. There is some doubt as to the exact date when the dedication took place; in 1 Macc. iv., 52–54 the date is given as the 25th of Chislev (December) «the same day the heathen had profaned it,» but the day when the pagan altar was set up is given in 1 Macc. i., 54 as the 15th of Chislev. It is most probable, however, that it took place on the 25th from the manner in which the feast is now celebrated, and from the fact that both nations celebrated the winter solstice on that date. The use of lights was one of the characteristics of the feast, it is called the «Feast of Lights» by Josephus ('Antiq' xii 7, § 7), and the custom is also mentioned in Talmudic literature. The feast is mentioned only once in the New Testament (John ix, 22) in the following words: «And it was at Jerusalem the feast of the dedication, and it was winter.»

Dedlock, Lady, the wife of Sir Leicester Dedlock, in Dickens' novel called 'Bleak House.' Outwardly cold and haughty she is inwardly wretched in consequence of being haunted by recollections of her past life, and by fear that the existence of her illegitimate child, Esther Summerson, will be revealed. Lady Dedlock dies at the cemetery where her former lover is buried.

Deduction. Deduction is reasoning from a general principle to other less general truths which are dependent upon this principle. It consists in showing that the general law or principle assumed as the starting-point is applicable to a particular subject-matter, and in drawing the necessary consequences of its application. The form of this mode of influence is therefore given by the syllogism (q.v.), where the major premise (all M is P) states the general law, the minor premise (S is M) the application to a particular case, from which the conclusion (S is P) follows as a necessary con-

sequence. The principle of this method of reasoning is commonly described as subsumption: the conclusion is shown to fall under or be included in the more fundamental propositions which are assumed as the starting point. These latter propositions can similarly be derived from others of still greater generality, until at last we reach the ultimate principles which form the foundation of all science. As to the foundation on which the ultimate principles themselves rest, various theories have been held. Until comparatively recent times the prevailing view (though by no means universally adopted) has maintained that these propositions neither require nor admit of any demonstration. They are necessary intuitions of the mind whose certainty is direct and immediate, and of a higher type than demonstrations can yield. They thus constitute the basis of all science, since they are the fundamental first truths to which all science appeals as to an unquestioned authority. In the 17th and 18th centuries particularly, mathematics was regarded as the ideal science, and the position of the indemonstrable first principles of all science was often paralleled with that of the axioms of mathematics. It was assumed before the time of Kant that mathematics was wholly a deductive science which derived its results through an analysis of its initial concepts. In like manner it was hoped to put all knowledge on a demonstrative basis by discovering the whole system of necessary truths, and by showing how all particular facts in the various fields could be derived from them; for this would afford the absolute certainty which science was supposed to demand, *i.e.*, every fact would be deduced as a necessary consequence from some general principle. At this time the empirical conclusions reached by inductive reasoning were not regarded as worthy of the name of science, for they are not universal and necessary truths, but only particular and more or less probable.

The development of thought in recent times has, however, entirely revolutionized our ideal of knowledge, and at the same time broken down the sharp distinctions between necessary, or *a priori* principles, and empirical truth, as well as between induction and deduction as contrasted methods of reasoning. It is now generally recognized that there are no *a priori* truths in the old sense; no propositions that are certain in themselves apart from their connection with the rest of experience. No matter how ultimate any truth may appear, or how necessary in itself, its certainty and necessity are mediated in and through its relation to other experienced facts with which it is connected in the organic unity of a system. It is only through this systematic connection of the parts of knowledge that any inference is possible. For it is only in a whole, where the parts are systematically connected, that the nature of one part enables us to say what the other parts must be. And when it is seen that reasoning consists in making explicit the systematic connections of facts, the contrast between induction and deduction falls away. The structure of every inference is essentially the same; every inference is constituted by the relating of facts through a general principle. In deduction, as we have seen, the general truth is the starting point and we go on to explicate it in its application to some particular group of facts. On the other hand, the problem may be to find some relating principle for a given group of facts; and here we have to work in the reverse direction, beginning with the particulars and by the use of inductive methods seeking to bring to light some universal principles of connection. There are no sciences which use exclusively either one of these methods. Even mathematics, which popularly is supposed to employ only deductive reasoning, has constantly to appeal to induction of particular observations; and, on the other hand, the so-called observational sciences reason deductively in tracing out the application of the laws which have already been discovered and the consequences of the hypotheses which are employed. In every field thought uses all the means and methods which it can command to aid in solving its problems. Induction and deduction, observation and reasoning, are not separate and isolated processes, but functions of the knowledge-process which are supplementary and go hand in hand.

James E. Creighton,
Professor of Philosophy, Cornell University.

Dee, John, English astrologer: b. London 13 July 1527; d. Mortlake, England, 1608. In early life he had devoted much of his time to mathematical, astronomical, and chemical studies; and in 1548 rumors began to prevail that he was addicted to the black art. They were probably well founded; and to avoid the consequences he went abroad. In 1551 he returned to England, and through the instrumentality of Cecil, who presented him to Edward VI., obtained a pension of 100 crowns. The suspicion of the black art appears still to have clung to him, and shortly after Queen Mary's accession he was charged with practising against the queen's life by enchantment, and imprisoned. He obtained his liberty in 1555, and after Queen Elizabeth's accession was consulted by Lord Dudley as to "a propitious day" for the coronation. Lilly's account of him is that he was the queen's intelligencer, with a fixed salary; a great investigator of the more secret hermetical learning, a perfect astronomer, a curious astrologer, a serious geometrician, and excellent in all kinds of learning. The nature of his employments excited strong suspicion, and in 1576 he was furiously attacked by a mob, from which he had difficulty in escaping with his life. In 1578, during an illness of the queen, he was sent to consult with the German physicians and philosophers as to her recovery, and after his return was employed to draw up a sketch of the countries which, from having been discovered by English subjects, belonged to the crown. He accordingly prepared two rolls, giving both a geographical description and a historical account of the countries. These curious documents are still extant in the British Museum. After many wanderings, Dee, returning home, obtained from the queen in 1595, the wardenship of Manchester College, which he held nine years. It has been supposed, with some plausibility, that Dee's character as an alchemist was merely assumed to enable him to act more securely and effectually as a spy in the employment of the English government.

Dee, the name of several British rivers. 1. A river in Scotland, partly in Kincardineshire, but chiefly in Aberdeenshire, one of the best salmon rivers in Great Britain. It rises on the southwest border of Aberdeenshire, and flows generally east, 87 miles to the German Ocean. The city of Aberdeen is at its mouth. 2. A river of North Wales and Cheshire; rises in Lake Bala, Merionethshire; flows north-northeast and northwest to the Irish Sea, 20 miles below Chester; length, about 80 miles. 3. A river of Scotland, county of Kirkcudbright, rises in Loch Dee. It flows southeast and south into Kirkcudbright Bay; length, 38 miles.

Deed, a written instrument under seal, containing a contract or agreement which has been delivered by the party to be bound and accepted by the obligee or covenantee. It has also been defined as follows: "A writing containing a contract sealed and delivered by the party thereto." (2 Wash. Real Prop. 553.) The law requires greater form and solemnity in the conveyance of land, than in that of chattels. This arises from the greater dignity of the freehold in the eye of the ancient law, and from the light and transitory nature of personal property, which enters much more deeply into commerce, and requires the utmost facility in its incessant circulation.

In the early period of English history the conveyance of land was ordinarily without writing, but it was accompanied with overt acts, equivalent, in point of formality and certainty, to deeds. As knowledge increased, conveyance by writing became more prevalent and ultimately by the statute of frauds and perjuries, of 29 Charles II., Ch. 3, secs. 1, 2, all estates and interests in lands (except leases not exceeding three years) created, granted, or assigned, by livery of seisin only, or by parol, and not in writing, and signed by the party, were declared to have no greater force or effect than estates at will only. And by the fourth section no person could be charged upon any "contract or sale of lands, or any interest in or concerning the same," unless the agreement or some memorandum or note thereof, was in writing, and signed by the party to be charged therewith, or some other person by him lawfully authorized.

With some trivial changes this statute provision has been adopted or assumed as law throughout the United States. Deeds must be upon paper or parchment, must be completely written before delivery, must be between competent parties, and certain classes are excluded from holding lands, and, consequently from being grantees in a deed; must be made without restraint; must relate to suitable property, and should be signed, sealed, and delivered. The consideration of a deed must be good or valuable and not partaking of anything immoral, illegal, or fraudulent.

A deed should be delivered and accepted. A delivery is the transfer of a deed from the grantor to the grantee, or some other person acting in his behalf, in such a manner as to deprive the grantor of the right to recall it at his option. An absolute delivery is one which is complete upon the actual transfer of the instrument from the possession of the grantor. A conditional delivery is one which passes the deed from the possession of the grantor, but is not to be completed by possession in the grantee, or a third person as his agent, until the happening of a specified event. A deed delivered in this manner is an *escrow,* and such delivery should be always made to a third person. No particular form of procedure is required to effect a delivery. It may be by acts merely, by words merely, or by both combined, but in all cases an intention that it shall be a delivery must exist. It may be made by an agent as well as by the grantee himself. To complete a delivery, an acceptance must take place, which may be presumed from the grantee's possession. In a deed the premises embrace the statement of the parties, the consideration, recitals inserted for explanation, description of the property granted, with the intended exceptions. The *habendum* begins at the words "to have and to hold," and limits and defines the estate which the grantee is to have. The *reddendum,* which is used to reserve something to the grantor; the conditions; the covenants; and the conclusion which mentions the execution date, etc., constitute the formal parts of a deed and properly follow in the order observed here. The construction of deeds is favorable to their validity; the principal includes the incident; punctuation is not regarded; a false description does not harm; the construction is least favorable to the party making the conveyance or reservation; the *habendum* is rejected if repugnant to the rest of the deed. The *lex rei sitæ* governs in the conveyance of lands, both as to the requisites and the forms of conveyances.

Chancellor Kent, after observing that in the United States generally the form of conveyance is very simple, says: "I apprehend that a deed would be perfectly competent, in any part of the United States, to convey the fee if it was to the following effect: 'I, A. B., in consideration of one dollar to me paid by C. D. do grant, bargain and sell to C. D. and his heirs, the lot of land (describe it), witness my hand and seal, etc.' "

Deeg, dēg, India, town and dismantled fortress in Rajputana, state of Bhurtpore, 24 miles west of Muttra. It is situated in the midst of marshes, and almost surrounded by water during a great part of the year. At the southwest corner is the lofty rock of the Shah Boorj, on which the citadel stands. Deeg is a place of great antiquity, and contains a remarkably fine palace, only surpassed in beauty by the Taj Mahal of Agra. Holkar was defeated here by the British under Gen. Fraser in November 1804, and the following month the town and fortress were taken. Pop. 16,000.

Deems, Charles Force, American clergyman and writer: b. Baltimore, Md., 4 Dec. 1820; d. New York 18 Nov. 1893. From 1866 to his death he was pastor of the Church of the Strangers of New York, and was widely known as editor and author. Included in his publications are: 'Triumph of Peace and Other Poems' (1840); 'The Light of the Nations' (1870); 'Weights and Wings' (1872); 'Chips and Chunks for Every Fireside'; and 'My Septuagint' (1892).

Deemster, an officer once attached to the high court of justiciary in Scotland, who formally pronounced the doom or sentence of death on condemned criminals. The office was conjoined with that of executioner. The name is now given in the Isle of Man to two judges who

act as the chief justices of the island, the one presiding over the north, the other over the south division.

Deemster, The, a novel by Hall Caine, called by the author the story of the Prodigal Son. It was published in 1877. The scene was laid in the Isle of Man, and opens in the latter part of the 17th century. The Deemster is Thorkell Mylrea, whose nephew Dan, the prodigal, deeply loves his cousin Myra; but her brother Ewan interferes and a duel ensues, resulting in the death of Ewan. Dan is tried and is declared cut off forever from his people, and banished to a remote corner of the island. During a visitation of the plague, Dan takes the place of Father Dalby, the Irish priest, effecting many cures and at last dying of the pestilence. A dramatization of 'The Deemster' was produced by Wilson Barrett under the title 'Ben-Ma-Chree.'

Deep Bottom, Va., Battles at. 1. On 25 July 1864, Gen. Grant, then besieging Petersburg, ordered a movement, the principal object of which was to threaten Richmond and draw as many of Lee's troops as possible from the lines in front of Petersburg, so as to give promise of success in asaulting them, upon the springing of a mine prepared by Gen. Burnside. Deep Bottom is opposite a great bend of James River, making a neck of land known as Jones' Neck, at a point where Bailey's Creek flows into the James from the north. Butler's pontoon bridges, one below and one above the mouth of the creek, were held by Gen. R. S. Foster with a brigade of the Tenth corps. The Confederates were entrenched on the west side of the mouth of the creek in Foster's front. About 2 A.M. of the 27th, Hancock began crossing the James by the lower bridge, to turn the Confederate left, while Foster attacked the right. At daylight all moved forward. Gen. Nelson A. Miles' brigade drove the Confederates from their position on the New Market road, east of the creek, and captured a battery of heavy guns, but progress across the creek was barred. From the river to Fussell's Mill, a distance of about two miles, its west bank was held by Kershaw's and Wilcox's divisions, joined during the day by Heth's division. On the morning of the 28th, Kershaw advanced on the Charles City road and drove Sheridan back over a ridge upon which he was posted; but Sheridan, dismounting his men, drove Kershaw back in some confusion, taking 200 prisoners and two colors. Reinforcements arrived until five eighths of Lee's army was now north of the James. Grant wanted no assault made, and on the 29th Hancock and Sheridan recrossed the James. The Union loss in this movement was 334 killed and wounded.

2. Gen. Grant, on 12 August, ordered another movement on the north side of the James to threaten Richmond. Hancock's Second corps, part of the Tenth corps, under Gen. Birney, and Gen. Gregg's division of cavalry, were designated for the purpose. Birney's command was at and near Deep Bottom; the cavalry and artillery went by land, as in July; and Hancock's corps marched to City Point and took steamers for Deep Bottom, 16 miles up the river, where it was landed on the morning of 14 August. Mott's division was to advance on the New Market road and drive the Confederates into their works beyond Bailey's Creek, while Barlow, with his own division and Gibbons', was to move on Mott's right, and assault the line near Fussell's Mill. Gregg's cavalry was to cover Barlow's right, and when the infantry uncovered the Charles City and Darby roads, was to make a dash on Richmond, if opportunity offered, and if not, to destroy the railroads entering it. Birney was to attack the Confederate right, and, if successful, move up the river roads on Chaffin's Bluff. Field's Confederate division held Bailey's Creek and Wilcox's division was at Chaffin's Bluff. At the first intimation of Hancock's movement Wilcox moved up and joined Field, and from the south side of the James Gen. Lee sent Mahone's division of infantry and the two cavalry divisions of Wade Hampton and W. H. F. Lee. Johnson's and Gary's brigades followed, and there were three regiments from Pickett's division. Mott advanced on the New Market road, but was checked at the creek. It was 4 o'clock before Barlow, on his right could get up one brigade, and with this he assaulted the position near Fussell's, was repulsed, and rested for the night. On the right Gregg had advanced well up the Charles City road, and on the left Birney seized a part of the Confederate line and captured three guns. On the morning of the 15th Birney's corps and a brigade of Mott's division endeavored to turn the Confederate left. Birney moved toward the Charles City road, on which Gregg was advancing, but he made so wide a detour and found so many obstructions, that it was night when he found his proper position, and attack was deferred until morning. As a diversion to his attack Gregg's cavalry, supported by Miles' brigade of infantry, were to move up the Charles City road. Gregg was off at an early hour of the 16th, driving the Confederate cavalry beyond Deep Creek, as far as White's Tavern, only seven miles from Richmond. At 10 A.M. Terry's division of Birney's corps, supported by Craig's brigade of Mott's division, and Birney's brigade of colored troops, advanced against the Confederate line near Fussell's Mill, and, after a severe fight, carried it, taking three colors and between 200 and 300 prisoners from Mahone's and Wilcox's divisions; but the Confederates soon rallied, retook their works, and drove Terry back. Soon after noon the Confederate cavalry, supported by infantry, advanced on Gregg and Miles, slowly driving them back to Deep Creek, and later in the day across it. There was a cessation of hostilities on the 17th. On the 18th the Confederates advanced from their works above Fussell's Mill and attacked Birney, who, with the assistance of Miles, repulsed them. On the night of the 20th the Union troops were withdrawn and returned to their positions in front of Petersburg and at Bermuda Hundred. In this battle the Union troops numbered about 28,000, the Confederates about 20,000. The Union loss was 2,161 killed and wounded, and 625 missing. There are no returns of Confederate losses. Consult: 'Official Records,' Vol. XLII.; Humphreys, 'Virginia Campaign of 1864–5'; Grant, 'Personal Memoirs,' Vol. II.; Sheridan, 'Personal Memoirs,' Vol. I.; Walker, 'History of the Second Army Corps.'

E. A. Carman.

Deep River rises in Guilford County, N. C. Its general direction is southeast to Chatham County, where it unites with the Haw River and forms the Cape Fear River. Its

length is about 125 miles; it has good water power, some of which is utilized at Lockville.

Deep-sea Exploration. The exploration of ocean depths dates from 1867, when Pourtales and Mitchell, officers of the United States Coast Survey, engaged in systematic sounding and dredging in the Straits of Florida. From 1868 to 1872 a similar work was undertaken by Wyville Thomson, carpenter, and George Jeffries, in British vessels, sounding the Mediterranean and North Atlantic. Beginning in December 1872, and continuing until the spring of 1876, the Challenger, a British ship, under Nares and Thomson, made a tour of the world, taking soundings and dredging from 362 stations. France and Norway sent out expeditions for a like purpose at a later date. The Prince of Monaco also took great interest and did much sounding from his yacht, bringing up fish from a depth of two miles. Excepting the successful and complete work of the Challenger, most of the exploration valuable to science has been done by the United States, the Bibb making a tour in 1868–9, and the Blake doing continuous duty in this field from 1877 to 1880, under the co-operation of Agassiz, Sigsbee, and Bartlett, while the United States fish commission vessels, Albatross and Fishhawk, engaged in lengthy exploration under Baird, Belknap, Tanner, etc.

The average depth of the ocean is now known to be about 2½ statute miles. Its floor has a contour very similar to that of the land, there being vast levels or plains, ravines, gorges, ridges and mountains that rise into islands, and deeps that fall farther below the sea-level than the topmost peaks of the Himalayas rise above that level. Light penetrates about 100 fathoms, or in specially clear water, under the direct rays of a tropical sun, to perhaps nearly 200 fathoms, and below it is all dark, except for the phosphorescence of some of the deep-sea inhabitants. The depths are also cold, approaching the freezing point in all latitudes. The cold waters from the frozen poles flow in slow currents along the bottom, over the dead marine organisms that strew the greater portion of the ocean floors, down to the deepest regions, where the bottom is of red clay of Tertiary formation.

The 100-fathom depth to which light penetrates has been termed the littoral region, and within this grow marine algæ, and the animals that feed upon them. The depths below 1,000 fathoms have been termed the benthal area, while the area between 100 and 1,000 fathoms has been termed the abyssal area. The slopes along the edges of the continents, extending roughly 200 miles from land, constitute the region of terrigenous deposits, the sea bottom being composed more or less of the washings carried down by the great rivers that drain the continents. Besides the washings, which partake of the nature of the adjoining land, this region contains green coral, and volcanic mud. Beyond the influence of the shore washings comes the region of pelagic deposits, the ocean floor being strewn with dead marine organisms that have sunk from the littoral region.

The immense pressures of the great deeps below 3,000 or 4,000 fathoms are probably accountable for the fact that the dead organisms (so common to higher regions) are not found, but apparently dissolve and float away in the currents. The deepest holes have a bottom of red clay that appears to have undergone no material change since the Tertiary Period.

Since there are no algæ below the littoral region, it follows that all the marine animals below are carnivorous. None of these are ever brought up alive, since, if alive when netted, they succumb to the expansion that results from their being brought up to the surface where the pressure is so much below what they are constructed to reside in. The sea pressures are enormous, increasing from 15 pounds per square inch at the surface to a ton per square inch at a depth of 1,000 fathoms. The fish brought up from a depth of 3,000 fathoms are therefore subject to a surrounding pressure of three tons per inch of surface, a pressure that would be dangerous to a high-grade steel boiler. The deep-sea fishes do not succumb to it, because their tissues are porous, and the fluids of their bodies are of a like pressure with their surroundings. This maintains a balance that subjects them to no more strain than would a solid shot receive by being immersed at the same pressure. The bones of these fishes, instead of being built heavy to withstand a crushing pressure, are made fibrous and full of porosities, and include scarcely any calcareous matter. When these fish are brought to the surface their joints and muscles are found to be very loosely connected, and they have to be handled very carefully. Some of them are sure to break up with the least handling, as the *Plagiodus* of the Madeiran Sea. The deep-sea fishes universally are provided with air-bladders, and these of course tend to expand as the fish are brought up. Probably they could be brought up alive, if the speed of raising them were very slow. There are many deep-sea fishes that live at or near the surface when quite young, and go deeper as they advance in age. Nearly all the deep-sea fishes are classified among the same families as the fishes familiar on the surface, but the *Alepocephalidæ* and *Halosauridæ* are found only in the depths.

At a depth of 400 fathoms the *Gobiidæ, Blenniidæ, Percidæ, Scorpænidæ, Trichiuridæ, Cottoidæ, Cataphracti, Bathythrissidæ,* and most of the *Trachinidæ* cease to exist. At a depth of 500 fathoms the sharks, rays, and flatfish are no longer found. At a depth of 700 fathoms the *Cottoidæ, Discoboli, Zoarcidæ,* etc., disappear. The limit of the *Holocephali* is about 1,200 fathoms. The families commonly found at the greatest depths, 2,500 fathoms and under, are the *Berycidæ, Ophidiidæ, Pediculati, Macruridæ, Sternoptychidæ, Scopelidæ, Stomiatidæ,* and *Murænidæ.*

Both the number and variety of fish decrease as depths increase, as the vast body of marine animals prefer to live near the surface.

The phosphorescent fishes are mostly characterized by luminous organs, which present all sorts of modifications as to location, appearance, and structure. Some of them are luminous all over when in motion and non-luminous when at rest, the brightness being occasioned by a luminous secretion emitted when the creature is active. Some of the deep-sea creatures are blind, others see by phosphorescent light, which they or other organisms emit. The fishes in the very great depths have small eyes, while those of moderate depths have large optical organs. Many deep-sea animals have highly developed feelers; the coloration of others is extremely

brilliant, yellows, reds, greens, and purples being dominant colors, while there is a strange absence of blue. The fishes are mostly dark-colored, while the crustaceans, holothurians and starfish are the most brilliant, the colors being often in large patches of striking contrast. No deep-sea fishes above about five feet in length have been taken. This is not regarded as evidence that they do not grow longer, the fact that the mouths of the largest beam-trawls in use are only about 11 by 2 or 3 feet probably having something to do with the matter.

The dredge or beam-trawl commonly used is a form of big bag-net, of 20 to 25 feet in length, that is weighted and dragged along the bottom. As many as 800 fishes have been brought up in a single haul with such a dredge, from a depth of 1,770 fathoms, in Bering Sea. Four or five hours are required to dredge at such a depth. The deepest haul on record at which animal life was obtained was made by the Albatross of the United States Fish Commission, near the Tonga Islands, the depth being 4,173 fathoms. Ten hours elapsed from the time the dredge went overboard till it was brought again to the deck.

The tangle is a device used for bringing up specimens of fauna or anything it can catch. This consists of an iron bent in the form of an inverted V and having frayed rope attached to it. During recent years gill-nets have been used at a depth of a mile, and traps and trawl-lines have also been sunk to considerable depths.

The first reliable sounding at a great depth is credited to Capt. Sir James Clark Ross, who in 1840 sounded 2,677 fathoms on the west coast of Africa. Subsequent soundings were reported as deep as 7,000 fathoms, but as these were made with the old-fashioned clumsy apparatus that tended to drift tremendously, and as they do not agree with modern soundings, they are not credited. In 1854 J. M. Brooke of the United States navy, suggested the employment of a dropped weight in deep-sea sounding, and this was found to assist matters so much that it has remained in use ever since. The first attempts to substitute wire for rope were not very satisfactory, owing to the too great thickness and weight of the wire used. When steel piano-wire of great tensile strength was brought into use and weighted with a 60-pound shot, arranged to be dropped, it was found that the soundings were made with a close approach to accuracy, and at much greater speed in much less time than before.

In 1872 there was invented the cylinder sounding machine in which a cannon-ball was used for the sinker, the ball having a hole bored through it, in which was placed a metal tube or small cylinder. When the weight descended into the muddy bottom, the tube was filled with mud, and a device closed it, at the same time releasing the ball. Another device originated later consists of two hemispherical cups, normally hinged so as to be apart. When the weight strikes the bottom it brings the cups together, so that they grasp whatever is in the way. The wire used in soundings weighs about 14 pounds to the mile, and very ingenious reeling-machines have been devised for handling it. The first difficulty to be overcome was the roll of the ship, which tended to jerk the line. This is compensated for, and a friction device is adjustable so as to balance the weight of wire, etc., that is out. Elastic appliances, called accumulators, were devised by C. D. Sigsbee of the United States navy, and these have made it possible to employ steam power in paying out and reeling in the line.

The testing of deep-sea currents is done with the current-meter, the accepted form of which is hung on a wheeled traveler from the line sent down. A screw-propeller-like device rotates with the current, and there is a contrivance for registering the number of revolutions, from which registration the speed can be computed. The older devices, which were less satisfactory, depended upon the differential motion of surface floats to note the difference between upper and lower currents.

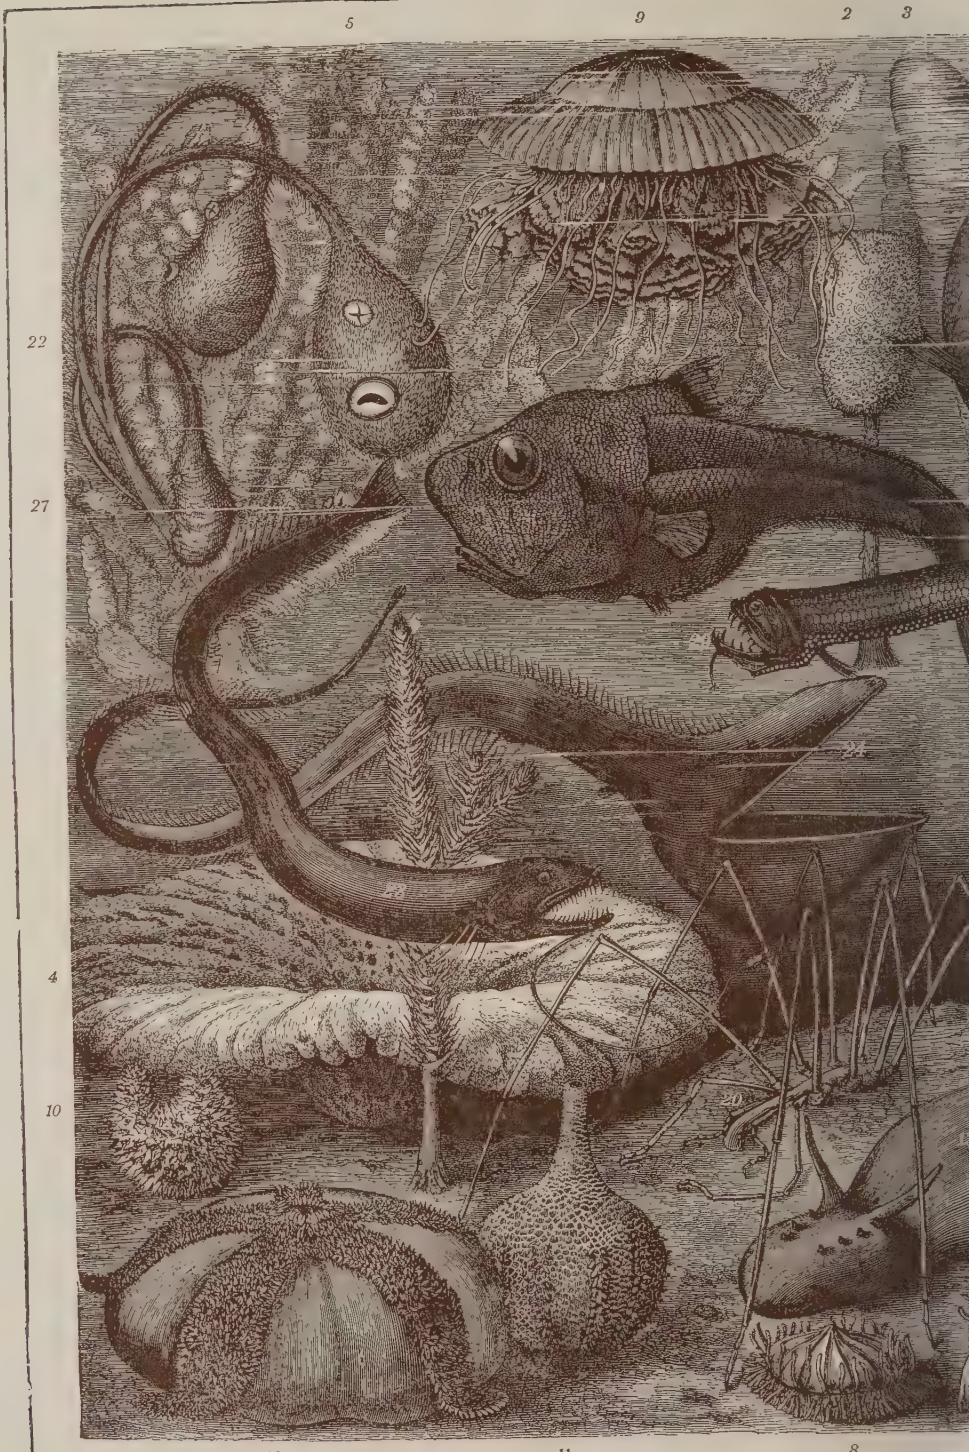
When it was first endeavored to take temperatures by thermometers at considerable depths it was found that the results were erroneous, apparently because of the increased pressure. Miller and Cassella invented a double thermometer that partially overcame the difficulty, but it served to register only the maximum and minimum temperatures. Negretti and Zambra improved on this, arranging the thermometer in reversed position while descending, and bringing it back to proper position at the depth of the test. The turn resulted in separating the column of mercury above the bulb, and the correct temperature could be indicated.

A most ingenious apparatus for reading the temperature of a descending sounding apparatus from the deck of a vessel has been designed by Sir William Siemens. He secures the temperature on the Wheatstone bridge principle, by the electric resistance of a conductor. A copper vessel of water is heated or cooled until the bridge balances, and the temperature of the water in the vessel is then the same as that below. The apparatus is unfortunately too delicate for ordinary use. All instruments sent down into the depths have to be protected against the pressure, their strength being proportioned to the depths to which they are to be used.

The deepest sounding made up to 1876 was that of the Tuscarora, of the United States Fish Commission, which reached 4,655 fathoms off the coast of Japan, in 1874. The Challenger's deepest sounding was also in Japanese waters, near the Admiralty Islands, the depth being 4,575 fathoms. In 1896 the British ship Penguin got 5,155 fathoms north of New Zealand, breaking the record. This was the deepest found until 1900, when the United States cable survey ship Nero found a depth of 5,269 fathoms near Guam. Other deep soundings are those of the Albatross of the United States Fish Commission, which located a depth of 4,813 in the western Pacific, and of the Blake of the United States Coast Survey, which sounded 4,561 fathoms off Porto Rico, this being the deepest yet recorded in the Atlantic Ocean. No deep places have been found north of the 55th degree of latitude, which tends to confirm the theory of some that the Arctic Ocean is shallow. Consult: Agassiz, 'Three Cruises of the Blake'; Sigsbee, 'Deep-Sea Sounding and Dredging'; Tanner, 'Deep-Sea Exploration.'

CHARLES H. COCHRANE.

Deep-sea Life. It is difficult to draw the line between deep-sea life and that of shallow water, owing to the various depths in which certain species live. Thus the common shore-crab



1. Pheronema Carpenteri. 2. Hyalonema Sieboldii. 3. Semperella Schultzei. 4. Dactylocalyx pumi

urus globiceps. 28. Melanocetus Johnstoni. 29. Stomias boa.

of New England (*Cancer irroratus*) ranges to a depth of nearly 500 fathoms. The Challenger Expedition selected as defining the deep-sea fauna, a depth of 100 fathoms, others have taken 500 fathoms as marking its upper boundary, and still others a depth of 1,000 fathoms. A knowledge of this life is only obtainable by means of apparatus which will bring to the surface specimens from these great depths. The chief of these instruments, aside from the sounding lead which is very inadequate for this purpose, are dredges, tangles, and trawls, of which various patterns have been devised but which may be described in general terms as follows: The dredge consists of a rectangular frame-work of iron, one edge being sharpened or fitted with rake-like teeth to plow or scrape the bottom, while a net or bag fastened to the frame serves to hold the material collected and to bring it to the surface. This is best adapted for obtaining forms which live, attached to, or burrowing in, the ocean bottom. The trawl is a similar net so arranged as to be drawn just above the bottom and is valuable for collecting fishes which swim freely through the water. The tangle consists of large masses of unraveled rope, usually attached to a chain, which, sweeping over the ocean floor, entangles spiny forms like shrimps, starfish, sea urchins, as well as forms like hydroids and sea anemones, with numerous tentacles. Somewhat different is the Tanner net. This is so arranged that it can be sent down close to any desired depth, opened there, drawn through the water and then closed again before being drawn to the surface. By means of this the fauna of any desired depth can be collected without danger of admixture with forms from other depths. Details of the construction of these and many other pieces of collecting apparatus may be found in Agassiz, 'Three Cruises of the Blake'; Sigsbee, 'Deep-Sea Sounding and Dredging' (U. S. Coast Survey, 1880), and in the publications of the United States Fish Commission.

Although the dredge had previously been in use in the oyster and scallop fisheries it was first employed for scientific purposes (in moderate depths) by the Danish naturalist, Otto Fabricius Müller, 1750. (In America it was first used by Henry Wheatland of Salem, Mass.) Owing to faulty observations and to a belief that life could not exist in the greater depths of the ocean on account of the great pressure and the absence of light it was long thought that animals were not to be found at depths greater than 500 fathoms. This view disregarded the fact that Ross and Sabine, 1829, claimed to have obtained living animals from a depth of about 2,000 fathoms in Baffin Bay. Little by little evidence from sounding lines and submarine cables was accumulated which tended to overthrow this belief, but its complete disproval was accomplished by the dredgings of the United States Coast Survey in the Strait of Florida, 1867, when animals were found to be abundant at a depth of 700 fathoms. This was followed, 1869, by the expedition of the English ship Porcupine, which made successful casts of the dredge in 2,435 fathoms of water. Since that time numerous deep-sea dredgings have been conducted by the various governments, the most noticeable being the cruises of the English ship Challenger, the American Blake and Albatross, the French Travailleur and Talisman, the Russian Minineh, the Swedish Vanadis, the Dutch Barents Expedition, the German Tiefsee Expedition, and the explorations of the Prince of Monaco. The results of all these go to show that life, even of highly organized types, occurs in the greatest depths of the ocean.

Since the dredge, tangles and trawls can touch but a minute portion of the deeper parts of the ocean bottom we have, as yet, but an inadequate knowledge of the benthal or abyssal fauna for details of which the reader should consult the reports of the various expeditions previously mentioned. In general the following remarks may be made. The greater the depth, the fewer the species present. Thus in the collections of the Challenger, 2,050 species were taken in depths between 100 and 500 fathoms; 710 between 500 and 1,000; 600 between 1,000 and 1,500; 500 between 1,500 and 2,000 fathoms; 340 between 2,000 and 2,500, and 235 from depths greater than 2,500 fathoms. Again the results of the same expedition show that the number of individuals also decreases with the depth. In depths of over 1,000 fathoms the dredge rarely captured over 10 or 15 specimens of any one species, while in lesser depths hundreds of a kind are common.

The majority of the abyssal forms probably live on the surface ooze of the bottom and the minute organisms occurring in it, while these forms are in turn preyed upon by larger rapacious forms. A prominent feature of these is the frequent occurrence of phosphorescent organs which probably serve as a lure. Some are blind, some are provided with very large eyes, and it seems certain that all the light in the greater depths of the sea is produced by the phosphorescent organs. Another feature is the large size of some of the individuals. Thus while the shallow water species of the hydroid *Monocaulus* reach a length of but two or three inches, the deep-sea form is three feet long. It was hoped that the deep-sea fauna would reveal living representatives of extinct groups, but this hope was not realized, nothing having been found older than the horse-shoe crab (*Limulus*) the brachiopods, *Ceratodus,* the Port Jackson sharks and the Dipnoi of shallower or fresh waters.

Taking now the separate groups of living forms occurring in the deeper waters the following general remarks may be made: Plants are extremely rare and include only a few minute and inconspicuous forms. Even the lower *Algæ* (seaweeds) so common in shallower waters are lacking. Among the sponges the so-called glass sponges (*Hexactinellidæ*) are most abundant, some of the species being enormous (3 or 4 feet in diameter). The *Cœlenterata* are represented by the giant *Monocaulus,* already mentioned, and by a few jellyfish and corals. All groups of Echinoderms occur, most noticeable being the comparatively large number of crinoids and of holothurians, many of which are strange in structure and bizarre in outline. The *Arthropoda* consists largely of prawns, schizopods and isopods, some of the latter being gigantic in size, and the strange sea spiders (Pycnogonids), some having slender legs extending a foot or more from the body. Crabs are rare, as are also annelids and molluscs, while a few brachiopods (and these not of the oldest types) occur. Possibly the most interest-

ing are the fishes. Many of these are noticeable for their strange shapes, and especially for the long and slender teeth and the distensible stomachs. Thus the *Chiasmodon niger,* the black swallower, has been taken with a fish, actually larger than itself, coiled up in its stomach. On the other hand, *Eurypharynx* and *Gastrostomus,* the pelican fishes, are eel-like forms with enormous mouths and with a trunk not as long as the lower jaw. These lack teeth and are supposed to live not upon other fishes but upon minute forms which they collect in their enormous scoop net. *Ipnops* lacks eyes but has nearly the whole top of the head converted into a pair of phosphorescent organs, while in the *Ceratiidæ* the head frequently bears tentacles with phosphorescent organs at their tips. The ribbon fishes (*Regalecus*), which are occasionally found floating, exhausted or dead, at the surface of all the seas, are presumably deep-sea forms, although none have been drawn up in the trawl. As the common name indicates they are band-like in appearance, and since specimens have been taken measuring over 24 feet long it is possible that these or larger specimens may form part of the basis of sea-serpent stories. A noticeable feature of all the deep-sea forms is the prevalence of red and brown colors. Many of the fishes when brought to the surface have the viscera forced out through the mouth by the expansion of the air in the swim bladder.

Two factors render life possible in the greater depths of the sea. The constant currents descending from the surface in the polar regions to the bottom and thence to the equatorial regions bring with them the necessary oxygen, although the amount of this gas present in the greatest depths is much less than at the surface. The other factor, that of food, is, in the last analysis, furnished by the constant death of surface (pelagic) forms, whose dead bodies, slowly sinking through the water, furnish the nourishment needed by the simple abyssal animals, which in turn are preyed upon by those more highly organized. The literature of deep-sea life is enormous. The student should consult the reports of the various expeditions mentioned above, especially those of the Challenger expedition. Many papers will be found in the publications of the U. S. National Museum and the U. S. Fish Commission, while general summaries are afforded by Agassiz's, 'Three Cruises of the Blake'; Moseley's 'Notes of a Naturalist' and Sir Wyville Thompson's 'Voyage of the Challenger.'

J. S. Kingsley,
Tufts College, Mass.

Deer, animals of the family *Cervidæ* (q.v.), which are noted for their grace of structure and their fleetness of motion. Since the earliest times they have been known as objects of the chase, and their meat, "venison," is considered a delicacy. They were especially renowned in Greece; and we find many references to them in Scripture. The male deer is usually called a "stag," or when mature a "hart." The female is called a "hind," or "doe." The term doe, however, is applied also to females of the antelope family.

The deer is valued not only as food, but for commercial purposes. The skins make a peculiarly strong, soft leather, known to trade as buckskin; this is valuable for shoes, saddles, etc. The skins with the fur on are sometimes used for tent-covering, and also make excellent rugs. The hoofs and horns are prized for ornamental purposes, especially the antlers of the roe-deer, which are utilized for making umbrella-handles, and for similar purposes; and the elk-horn, often employed in making knife-handles. The Chinese also make a medicine from stag-horn and they eat the antlers of certain species when "in the velvet."

The reindeer is, commercially considered, as valuable to the frozen north as the camel is to the desert traveler. Its fleetness and surefootedness, as well as its strength and power of endurance, render it invaluable to man in the far North. Consult: Lydekker, 'Deer of All Lands' (London 1898); Roosevelt (and others), 'The Deer Family' (New York 1902). See Cervidæ, the names of various genera, and English names, as Elk, Moose, etc.

Deer Forests, large tracts of waste or uncultivated and mostly uncultivable land, chiefly situated in the Highlands of Scotland, set apart as grounds in which the stag or red-deer is hunted for sport, but is otherwise protected and allowed to roam in its natural wild state. The name forest does not in this case imply the existence of trees. As a matter of fact most deer forests are mountains or high-lying stretches of ground, exhibiting large areas covered with heath, in many places peat-bogs, marshes, lochs, or bare rock, elsewhere patches of grass or other herbage, while plantations of trees of greater or less extent may also occur. Some of the deer forests are of very great extent, the larger covering, say, from 50,000 to 70,000 acres. The counties in which they are chiefly situated are Sutherland, Ross and Cromarty, Inverness, and Argyle, while they also exist in Aberdeen, Banff, Forfar, Perth, and Caithness. A number of them are retained in the hands of their proprietors, while many others are let, either for the shooting season or for a period of years, and in this case may bring a large rental to their owners. The annual letting value of the larger deer forests may run from £1,000 to £4,000 or even more, and the total rental of the deer forests of Scotland has been set down at over £200,000 per annum. Every stag killed costs the person who rents the ground about 50 guineas. For a deer forest is always an expensive affair, not only for the rent that has to be paid, but also for the number of keepers, gillies, watchers, beaters, etc., that have to be employed in connection with it.

Deer-grass (*Rhexia virginica*), the American representative of the Asiatic family of plants called *Melastomaceæ,* meadow-beauty family, of which only 10 species are found in the United States. The deer-grass extends from Maine to Florida, and west to Illinois, Missouri, and Louisiana. Other species extend the habitat of the genus to Texas. The flowers are conspicuous and showy, with bright rosy purple petals, and render the meadows unusually gay when adorned with patches of this lovely plant, entitling it to the common name of the meadow-beauty.

Deer-mouse, the common white-footed mouse of North America, a rodent of the family *Muridæ,* genus *Hesperomys.* The main color of its body is buff or fawn, growing dark along

SAMBUR (*Cervus Unicolor*)

1. The Sambur (Cervus Aristotelis).
2. The Virginia Deer (Cariacus virginianus),
3. The Elk (Alces palmatus).
4. The Axis (Cervus axis).
5. The Muntjac (Cervulus muntjac).
6. The Reindeer (Rangifer tarandus).

the back, the feet and under parts being snowy white. With full, bright eyes, high, rounded ears, long whiskers and tail, graceful and sprightly movement, it is a very attractive little animal. It has been found to have small cheek-pouches. Its length rarely exceeds four inches, its tail being nearly as long. In different sections of the country its markings and habits are varied, and in some it seeks a home in the human dwelling, as do other mice.

Deer-stalking, an exciting but laborious mode of hunting the red-deer, in which, on account of the extreme shyness of the game, their far-sightedness and keen sense of smell, they have to be approached by cautious manœuvring before a chance of obtaining a shot occurs. Great patience and tact and a thorough knowledge of the ground are essential to a good stalker, who has to undergo many discomforts in crouching, creeping, and wading through bogs, etc. Advance from higher to lower ground is usually made, since the deer are always apt to look to the low ground as the source of danger. "Deer-driving" toward a point where the shooters are concealed is often practised, but is regarded as poor sport by the true deer-stalker.

Deerfield, Mass., a town of Franklin County, on the Connecticut River, and the Boston & Maine, and the New York, New Haven & Hartford R. R.'s; 33 miles north of Springfield. It is an agricultural region, and its industries are chiefly related to agricultural products. It has a high school and public library. The town contains the village of South Deerfield, and in colonial times was the scene of several contests with the Indians. Among them were the "Bloody Brook Massacre" (1675), and the burning of the village by the French and Indians under De Rouville (1703). Old Deerfield has a beautiful soldiers' monument, and there is at South Deerfield a marble monument commemorative of the Bloody Brook disaster. Eliza Allen Starr, author and art teacher, was born in Deerfield. Pop. (1900) 1,969.

Deerfield River, a river in Massachusetts, rising in southern Vermont and flowing generally southeast for 60 miles, when it enters the Connecticut River. The great fall of the river of nearly 1,100 feet in 50 miles furnishes water power at many places, of which the chief are at the Hoosac Tunnel and Shelburne Falls. Several streams nearly as large as the main river enter it from the north.

Deerhound, a Scotch greyhound, with a shaggy coat, covering his body, except the legs and tail. He is somewhat heavier than the English breed of greyhound, as well as somewhat larger. As the name suggests, this dog was employed for deer-hunting; and one of its older names was "buckhound."

Deerslayer, The, the last published (1841) of the 'Leatherstocking Tales,' by J. Fenimore Cooper, though written many years before its appearance. See NATTY BUMPPO.

De Facto, dē făk'tō (Lat. "in fact"), a legal term used in contradistinction to *de jure* (by right). It is commonly used in regard to governments, some of which are supposed to be based on divine right, others on usurpation. A *de facto* government, when established, is now always recognized as *de jure*. The term *de facto* is often applied in ordinary administrative law to designate the practice of illegal authority which has been exercised under apparent right.

Defama'tion, the speaking or writing words of a person so as to hurt his good fame. Written defamation is termed libel, and oral defamation slander. The provisions of the law in respect of defamation, written or oral, are those of a civil nature, which give a remedy in damages to an injured individual; or of a criminal nature, which are devised for the security of the public. Slander was recognized as an individual wrong, and an offense against the public peace, at an early period of the English law. Libel was hardly known. This, however, is not strange; it is not to be supposed that it would have been, among an illiterate people, few of whom could write, and not many could read. Until education and learning had made considerable progress, and with them the arts and sciences, the offense of libel was comparatively rare. Libel had only very narrow limits in rude and despotic times, and not the same precision it has acquired in the days of liberty and science. As soon as writing became general it was used for abuse. People became jealous of their characters and reputations, which they found were thus in the power and at the mercy of every malicious writer, and then they claimed, as one of their first and absolute rights, the protection of character and reputation against a weapon more potent than slander, because committed to writing, and consequently more lasting and impressive and more dangerous to society. This was the mischief which the law of libel was designed to restrain. And when printing came into more general use it became more and more apparent that the law of libel was founded in reason and justice, and thus as learning progressed the law of defamation spread its influence, and finally placed a wholesome restraint upon the printing-press, as well as upon the instruments of the author, the critic, the painter, and the poet. The law forbids revenge, and the tongue is restrained. Character and reputation are treated as the safeguards of social position and success in life. They have always been recognized as absolute individual rights. Libels and defamations are classed as private injuries of the highest degree by Justinian in his 'Institutes.' Words are slanderous, and therefore actionable, when imputing the commission of some criminal offense involving moral turpitude. Words which impute to the party spoken of unfitness to perform the duties of an office or employment, or which charge that a party is infected with a contagious disease, are slanderous. A libel is anything which is written, printed, published, or pictured, calculated to injure the character of another by bringing him into ridicule, hatred, or contempt.

Default, a failure to appear in any court on the day assigned; especially applied to a defendant when he fails or neglects to plead or put in his answer on an appointed day. In such cases the plaintiff is entitled to sign judgment against him, which is called judgment by default, and the defendant is said to suffer judgment by default. Failure to perform an obligation is termed a default.

Defaux, Alexandre, ä-lĕks-ändr dē-fō, French landscape painter: b. Bercy, near Paris, 27 Sept. 1826. He was a pupil of Corot, and his paintings display remarkable understanding of

perspective. He began to exhibit in the Paris Salon in 1859 and among his numerous landscapes are: 'View at Caen'; 'Abandoned Race Course at Ivry'; 'View of St. Maur, Coast of Gravelle' (1863); 'Evening in Spring' (1869); 'Fine Winter Day in Bas Meudon' (1873); 'The Loire after a Flood' (1873); 'Birches at Fontainebleau' (1874); 'Gravel Pit at Fontainebleau' (1877); 'Forest of Fontainebleau' (1879); 'Harbor of Pont-Aven (1880); 'Old Birch-trees at Pigeon Pond in Fontainebleau'; 'Low Tide in Normandy' (1884); 'After the Storm' (1885).

Defeasance, dē-fē'zans, **Deed of,** in law, an instrument which defeats the force or operation of some other deed or estate; and that which in the same deed is called a condition, in a separate deed is called a defeasance.

Defectives, Education of. Systematic care of the defective classes began in America in 1815, when a young theological student, Thomas Hopkins Gallaudet (q.v.), started for Europe to study methods of teaching the deaf and dumb. A school for this class was opened in 1817, one for the blind in 1831, and one for the feeble-minded in 1845 — practically 15 years apart. In each case the first schools were in New England, the second in New York, the third in Pennsylvania; and these schools followed one another quickly. All started in the face of more or less distrust as to their feasibility, and all were experimental, being started through private initiative. A few pupils were taught and exhibited before the amazed public, when in the case of the deaf and the blind private funds in abundance were contributed and the schools quickly established as private corporations. In the case of the feeble-minded the first school to be incorporated was a public organization — that is, it was supported by the State. Before 1822 the State had not been educated to the point of supporting schools for the special classes, but by 1848 it was ready to see its duty toward even the idiotic. The three States named having led the way, the movement spread quickly into Ohio, Kentucky, Virginia, and Illinois — in almost identical order for each special class. Here, however, the schools arose as State institutions. It had become an accepted part of public policy for the State to provide a means of education for all her children. The superintendents of the early schools for the deaf and dumb were generally clergymen; those of the blind and the idiotic, generally physicians. The institutions were necessarily boarding schools; and the early ones were established as a rule in or near the State capitals, chiefly that their achievements might be kept before the members of the legislatures, on whose practical sympathy their continuance usually depended. The large private or semi-public institutions are confined to the eastern States. Their support comes chiefly from private bequests and the interest on invested endowment funds. All, however, receive what is termed State aid, and make annual report to the State legislatures, to the commissioners of public charities or of public education. All are governed by honorary boards of trustees or managers, who appoint the superintendent or principal. In the semi-public organization the managers form a self-appointing, close corporation; in the public, they are appointed usually by the State governor, by whom they may also be removed. The semi-public institutions are usually well endowed. Their expenditures are, thus, not limited by legislative grant; and they are free from political interference, an influence which has sometimes seriously affected the State institutions. As a rule, the institution plants are large and well equipped, and even when in cities have ample lawns and playgrounds. The earlier institutions were built on the congregate plan; the later have generally adopted the segregate or cottage plan. The pupils are not committed to these institutions, but are admitted or rejected by the boards of trustees on the recommendation of the superintendents. The early institutions for all three classes of defectives began purely as schools. And all those existing to-day, except those for the feeble-minded, discharge or graduate all pupils after these have completed the course of instruction. A very recent movement, started by the instructors of the deaf, is the affiliation of the educators of the defective classes with those of the national education association. It is being more and more recognized that the line between a defective and a normal child cannot be drawn hard and fast, and that many a child who appears dull and stupid in school is in some measure defective. Systematic work for the deaf and dumb, the blind, and the feeble-minded began in France, and from France America learned the early methods.

The Deaf.— About the middle of the last century three schools for the deaf and dumb were opened in Europe. Though they sprang up about the same time they were wholly independent in origin. In Paris the Abbé de l'Epée having observed two deaf-mute sisters conversing by means of gestures, seized upon the idea that in gesture language lay the secret of instructing the deaf and dumb. He therefore elaborated a system of gesture signs and made it a medium of instruction in the school which he started. Heinicke in Dresden and Braidwood in Edinburgh simply adopted articulate speech as the language of man and taught their pupils through it, requiring them to speak and read the lips of others. Reports of their success having reached America, several parents of deaf-mutes sent their children to Scotland to be educated. These deaf children returned no longer as mutes; they were able to converse readily by speaking and lip reading. One of these parents published a book in London, wrote articles for the New England periodicals, with the intention of arousing interest in the new work, and took steps to ascertain the number of deaf-mutes in Massachusetts. In 1812 a little school for deaf and dumb pupils was opened in Virginia, having for teacher one of the Braidwood family, who had come to America. The school was the first of its kind in America. It was soon given up, as was a similar effort in New York. These events though seeming to result in little, yet had great effect in directing intelligent attention to this field of work.

A physician of Hartford, Conn., one of whose little daughters had become deaf, spent eight years in agitating the question of starting a school for such children. Thomas Hopkins Gallaudet was sent abroad to study methods. He went to Great Britain to study the only method that Americans knew about; but the

doors of the British schools were closed to him. He found the science and art of teaching the deaf regarded as a business monopoly. After nine months he gave up hope of acquiring the Braidwood method and spent at the Paris school the three remaining months of the year. This time being far too short he induced a deaf-mute teaching in the school to accompany him to America. This was the brilliant and accomplished Laurent Clerk, who became an engine of power for establishing schools for deaf-mutes in our country. The French method or sign-language method was improved and further systematized by our early teachers and in this form was the basis of instruction in all our schools for half a century. During the absence of Dr. Gallaudet the Connecticut Asylum at Hartford had been incorporated, but soon changed its name to the American Asylum, for it was then supposed that one school could accommodate for many years all the pupils of the country. Upon Dr. Gallaudet's return he and Mr. Clerk traveled for eight months among prominent cities in behalf of the cause of the deaf. On 15 April 1817 school work began at Hartford with seven pupils. During the year 33 pupils came. This was the first permanent school in the country. The founders of our schools differing from practice abroad, immediately established theirs on a permanent basis. Private aid was necessary at first, but no sooner had the feasibility of the work been shown than public moneys were granted.

In 1818 a school was opened in New York under a teacher from Hartford. In Philadelphia a little class started in 1819 was organized as an institution in 1820. In 1819 Massachusetts had provided an appropriation for the education of 20 indigent pupils at Hartford, and in 1825 New Hampshire and Vermont adopted the same policy, being soon followed by other States. Thus, through the efforts of the founders of the Hartford school, the policy of educating deaf-mutes at the public expense was firmly established in the United States, and has been adopted with few exceptions. Some of the western States secured means for the education of deaf-mutes by constitutional provision. Two years after the founding of the Pennsylvania school, Kentucky followed with its institution, being the first to be supported by a State. Ohio and Virginia soon followed. Thereafter institutions sprang up rapidly in the South and West. In 1857 there was incorporated by Congress the Columbia Institution at Washington, D. C., which requires special mention. Though originally intended as a school for educating the deaf children of government beneficiaries, a change largely owing to the energy of its principal, Dr. Edward M. Gallaudet, soon enabled the institution to confer collegiate degrees. It was then divided into two departments, the advanced taking the name of the National Deaf-Mute College. Thus, in 1864, America had taken a step "unprecedented in the history of deaf-mute instruction."

Most of the deaf and dumb are either born deaf or become so before acquiring language. They are dumb because they are deaf, and without special instruction can never know any but a gestural language. The pioneer educators of the deaf in this country were all "broad-minded men of liberal education," and they set a high standard at the outset for the work. A language of signs they saw was the key to the instruction of their pupils, who, indeed, were allowed so few years of schooling, that no time was to be lost in laboring over the extraordinary difficulties of teaching them speech. The language of signs is ideographic — "being readily expressive of ideas and emotions," rather than of phraseology. Put into words their order is very different from the natural order. The late superintendent of the Illinois institution, Dr. Gillett, writes: "When reduced to a system they [signs] form a convenient means of conveying to one mind the ideas conceived by another, though not clothed in the language in which a cultured mind expresses them. One addressed in the sign language receives the idea and translates it into English without any intimation of the phraseology in the mind of the speaker, so that a dozen persons familiar with the sign language, observing the gesticulations of a speaker, would each translate correctly the thoughts given forth, but no two of them would be in exactly the same phraseology. It is a concrete language, in which the expression of abstract ideas is exceedingly difficult." As the ideas are given out chiefly by means of hand gestures, schools using the sign language as a means of instruction are said to follow or use the manual method. Among the manually taught deaf this language early becomes the vernacular. As it is a language of living pictures, such deaf people think in pictures and dream in them. The sign language is said to be to the deaf what spoken language is to the hearing; and yet its use in the school room is deemed by many teachers extremely detrimental to the acquisition of the English language, which all our educators of the deaf agree is their chief end and aim for their pupils. They differ widely, however, over the use of signs. The greater number believe a moderate use of them to be economical of time and extremely useful to the deaf in the acquisition of knowledge. There is a small but growing number who dispense with signs *in toto* just as soon as possible. These latter teach by the intuitive, direct, or "English language method." They teach English by and through English, spoken, read, and written. It is extraordinarily difficult to get started by this oral method. But its advocates claim that once well started their pupils advance more logically, more surely, more precisely, and finally more swiftly than pupils allowed to use signs. Advocates of using the signs together with other means claim that the minds of most of their new pupils are sluggish from want of language to think in, and that they need to be aroused by the quickest method. They assert that "A large percentage of the deaf under proper methods can obtain a very useful amount of speech and lip-reading, but [that] there is also a large percentage of them that would be greatly restricted in their mental development, if allowed no other means of instruction." A proper and conservative use of the sign language always tends to mental development, saves time, and is the most efficient aid known in the acquisition of written and spoken language." The other school affirms that the two methods or systems are mutually exclusive, saying: "Of course no pupil can be taught under the intuitive and the sign method at the same time, and it is impossible to combine into one system a method which is depend-

ent upon the sign language at every stage of instruction with a method which dispenses absolutely with the sign language at every stage in teaching the English language. In the sign-language method instructors aim to teach the vernacular language through the intervention of signs, but their deaf-mute pupils acquire a mixture of natural signs, pantomime, conventional signs and finger spelling which becomes the habitual vehicle of thought and expression, wherever it is possible to use a gestural language, to the exclusion of the English language.» A form of the English language method, taught at the Rochester, N. Y., institution, substitutes finger spelling for signs as these methods are used in manual schools, and is called the «manual alphabet method.»

The history of the rise of the oral method is interesting. As has been said, the manual method reigned supreme for the first 50 years of the work. In 1843 Horace Mann, secretary of the Massachusetts State Board of Education, and Dr. Howe, director of the Perkins Institution for the Blind in Boston, made a tour of Europe. In his next annual report Horace Mann praised the oral method as taught in Germany, stating that it was superior to the method employed in America. The report was widely read, and caused no little commotion among our teachers of the deaf. Several went abroad to see for themselves, but did not agree with Horace Mann, and little change was then made in American methods. Still as a result of their recommendations, classes in articulation were introduced into several schools. Later, in 1864, there was an agitation in Massachusetts for the incorporation of an oral school in that State, and a small private school of the kind was soon opened near Boston. In 1867 the Clarke Institution (named for its founder) was incorporated by the Massachusetts legislature, and was opened as an oral school. In the same year a former teacher of an Austrian school opened in New York what soon became the New York institution for the improved instruction of deaf-mutes. Dr. Edward M. Gallaudet after investigations abroad reported that if the whole body of the deaf were to be restricted to one kind of instruction, he favored results to be obtained by the manual methods of America, but he advocated the introduction of articulation into all the schools of the country. A conference of principals of American institutions adopted resolutions in the line of President Gallaudet's recommendations, and classes in articulation were very generally introduced. During the next few years a gradual movement abroad toward the abolition of signs was evident; and at the second international conference at Milan in 1880, an overwhelming majority of the delegates present voted in favor of the oral method. American instructors of the deaf paid more and more attention to the question of methods, and conventions of articulation teachers were held. In the meantime Dr. Alexander Graham Bell had introduced to teachers his father's system of visible speech (q.v.). A similar but simpler system of visible speech symbols had been independently worked out by a Mr. Zera Whipple, of Mystic, Conn.; and more recently the Lyon phonetic manual has been devised, which is founded on the principle of visible speech and may be written in the air by the fingers. In 1888 the royal commission of the United Kingdom voted «that every child who is deaf should have full opportunity of being educated on the pure oral system,» but that those found physically or mentally disqualified «should be either removed from the oral department of the school of taught elsewhere on the sign and manual system.» In 1890 the American association to promote the teaching of speech to the deaf was incorporated, with Dr. Alexander Graham Bell as president. Dr. Bell immediately endowed the association handsomely. It cannot be denied that at times the controversy over methods has been bitter; to-day, however, it has been reduced to a generous rivalry, in which the champions of the various methods and systems are striving earnestly to find out the best means of instructing the deaf and to pursue it. The majority of our schools do not limit their teaching to any one method, but are eclectic, calling themselves «combined system» schools. The work for the deaf in this land has progressed remarkably. No other country has so many deaf pupils under instruction as this has, none has provided so generously for them, and there is none in which their educators are more alert to test new inventions and appliances that may bear upon the methods of instruction. And yet, unquestionably, the education of the deaf is still in its youth.

Soon after the beginning of the work 'The Annals of the Deaf' was started (now in its 44th volume). It is said to be the leading publication of its kind in the world. Its editor, Dr. Edward A. Fay, has made a most thorough investigation into the results of marriages of the deaf. The Volta prize of 25,000 francs awarded by the French government to Dr. Bell for his invention of the telephone, he applied to the founding of a bureau for the purpose of collecting and diffusing knowledge concerning the deaf. This is the Volta bureau of Washington, D. C. It has already published a large number of papers, studies, and books. The influence of Dr. Bell upon the work for the deaf has been deep and lasting. The invention of the telephone itself resulted from his experiments upon a device which he hoped would enable the deaf to read the vibrations of the human voice. Though a Scotchman by birth, he is practically an American, and has devoted his best energies and his means to furthering the work which he has made his profession. His great efforts have been toward the promotion of speech-teaching to the deaf.

As Dr. Gillett has said, «The instruction of the deaf is one of the most difficult fields in the entire department of education for achievement at once successful and satisfactory to the teacher.» For many years the parent school at Hartford was parent in the sense of providing principals and teachers for other schools. The New York institution has also furnished schools with many officers and teachers. It is only within comparatively recent years that normal classes, as such, have come to exist in a few of the schools. Among others, the Clarke Institution, the Wisconsin Phonological Institute, the school at Bala, Pa., and Gallaudet College have them — the latter announcing that it has opened to a limited number of college graduates annually, normal fellowships of $500, tenable for one year. Thus has the standard of deaf-mute teaching come to be in line with

modern university methods of training teachers. Public day schools for the deaf have sprung up in various places. The Horace Mann School of Boston is a notable example. They fill an unquestioned need, as many parents refuse to send their deaf children off to an institution. A still further movement toward decentralization has come to pass in Wisconsin. Wherever in this State a few deaf children can be gathered near their homes, State aid will be given to pay teachers sent there to teach them. And this movement is tending to become more and more general. All these day schools spread the oral method. An important effect of the rise of this method has been the lowering of the age when deaf children are received, and of lengthening their term of instruction; also of largely increasing the number of women teachers employed. The Home at Bala for the training in speech of little deaf children before they are of school age, takes them at the age when normal children learn to talk and teaches speech by talking to them and having them talk back as if they heard. There are several private oral schools for the deaf in this country where the pupils pay tuition. One of the best is the Wright-Humason school in New York. With the lowering of the age of pupils, kindergarten methods have been made use of more and more; though no true kindergarten can be conducted in schools where language comes so hard and so late, where even natural signs are arbitrarily interdicted, and where there can be no music. But the occupations and the games are widely applicable and are now universally used. The first duty of the teacher is to establish communication with the deaf child and thereafter, during his whole course at school, more than in any other kind of educational work, to make language the end of training and other subjects the means of varying language teaching. This statement is strictly true only of elementary education, but then the majority of deaf pupils do not advance far beyond the elementary stage, because so very much time is absorbed in language work that their progress in other things is slow; then, too, parents are prone to call their boys away from school as soon as they believe these can help sustain the family. A few of the brighter and more ambitious pupils from the schools take the course at the National Deaf-Mute College, now called Gallaudet College, where they have "an opportunity to secure the advantages of a rigid and thorough course of intellectual training in the higher walks of literature and the liberal arts." Occasionally we hear of deaf pupils taking high school work in schools with hearing pupils, and even of being graduated from colleges of the hearing.

The course of training at American schools for the deaf has always been practical. Indeed, industrial training is almost essential for those young people who would form industrious habits and facility in the use of tools, that will put them on their feet when they enter the world of labor; for most deaf pupils will have to work for their living. The trained deaf are not at all disqualified from self-support by simple inability to hear. In their schools general manual training is followed with a pupil until, for one reason or another, he chooses his trade or it is chosen for him. The general equipment for trade teaching is excellent. Printing is an extremely useful occupation for the deaf, especially in the acquisition of idiomatic language; and every institution for their instruction publishes one or more papers. Our educated deaf people form a quiet, well-behaved, self-supporting part of the community. They have formed local and national societies for mutual benefit. The convention of the deaf that met in 1893 at the Columbian Exposition at Chicago was the largest meeting of the kind ever held. Their speeches and deliberations and social gatherings occupied several days. Within the grounds of Gallaudet College at Washington stands a beautiful memorial statue of Gallaudet teaching a little deaf and dumb girl. It was presented to the college by the deaf of the whole country. In this memorial the deaf have made fitting recognition of their indebtedness to education.

The Deaf-blind.— "Obstacles are things to be overcome" is the motto given by Dr. Howe to the Perkins Institution for the Blind. When this remarkable man learned in 1837 that up in the mountains of New Hampshire there was a little girl not only blind but also deaf and dumb, he eagerly sought out the child and obtained the parents' consent to take her to South Boston to be educated. He had already formed a theory as to how he would reach a mind thus doubly shut in, and with the finding of Laura Bridgman came the wished-for opportunity to test this theory. It should be noted that Laura Bridgman saw and heard until she was two years old. She had been rather a delicate child, however, having enjoyed only about four months of robust health, when she sickened, her disease raging with great violence during five weeks, "when her eyes and ears were inflamed, suppurated and their contents were discharged." Her sufferings continued for months, and it was not "until four years of age that the poor child's bodily health seemed restored." She was intelligently active, following her mother about the house, seeming anxious to feel of everything, and thus to learn about it; and she developed signs for her father and her mother, and for some things.

She was eight years old when brought to the Perkins Institution. Dr. Howe writes: "There was one of two ways to be adopted: either to go on and build up a language of signs on the basis of the natural language, which she had already herself commenced, or to teach her the purely arbitrary language in common use; that is, to give her a sign for every individual thing, or to give her a knowledge of letters, by the combination of which she might express her idea of the existence, and the mode and condition of existence, of anything. The former would have been easy, but very ineffectual; the latter seemed very difficult, but, if accomplished, very effectual; I determined, therefore, to try the latter." After the child had become adjusted to the change of homes, Dr. Howe began teaching her by means of common articles with which she was familiar — spoons, forks, keys, etc., on which labels with their names printed in raised letters had been pasted. Similar detached labels were given her to feel. Her touch was acute enough, hence she was able to match labels, placing that for book on the book, etc. She did this easily and willingly because she received approbation for so doing; but the idea that the printed word stood for the name of the object had not entered her brain. Then other detached

labels were cut up into their component letters. These her memory soon enabled her to build into wholes or the words she had felt. Such exercises continued for many weeks to be only a meaningless play to the poor child. The success had been "about as great as teaching a very knowing dog," when suddenly the idea flashed upon her that "Here was a way by which she herself could make up a sign for anything that was in her own mind, and show it to another mind, and at once her countenance lighted up with a human expression; it was no longer a dog or parrot,—it was an immortal spirit, eagerly seizing upon a new link of union with other spirits! I could almost fix upon the moment when this truth dawned upon her mind, and spread its light to her countenance; I saw that the great obstacle was overcome, and that henceforward nothing but patient and persevering, plain and straightforward efforts were to be used." Next, she was given metal type each bearing some embossed letter, and a frame with holes to receive them. With this appliance Laura readily wrote the name of any object she knew and by writing them fixed in mind an extensive vocabulary of common names. Then the less cumbrous manual alphabet was taught her. Here was a means by which she could both write and read; she could spell to her teacher and read what her teacher spelled into her hand. Dr. Howe's reports teem with interesting psychologic material. At the end of the year he writes: "She is nine years of age, and yet her knowledge of language is not greater than a common child of three years. There has been no difficulty in communicating knowledge of facts, positive qualities of bodies, numbers, etc.; but the words expressive of them, which other children learn by hearing, as they learn to talk, must all be communicated to Laura by a circuitous and tedious method. In all the knowledge which is acquired by the perceptive faculties, she is of course backward; because, previous to her coming here, her perceptive faculties were probably less exercised in one week than those of common children are in one hour." And so her instruction went on. Through it all the child showed an eagerness to learn and to put herself in touch with the world that was a powerful aid to the teacher. In a few years, when Oliver Caswell, also deaf, dumb, and blind, came to the institution, Laura naturally took great interest in teaching him, and thereby profited much herself. As she approached womanhood her education was already good. She had learned to sew, to knit, and to do fancy work. She often visited her home, but her true home was the institution; there she died in her 60th year, the first case of any one so afflicted made capable of leading an industrious and happy life, and as the first case, historically the most remarkable. Popular interest in Laura Bridgman, both in this country and abroad, was naturally very great. The printed reports of her progress which were eagerly awaited were as eagerly absorbed. Distinguished foreigners coming to Boston visited her. Charles Dickens wrote in his American notes a sympathetic account of his impressions of her. The way to give liberty to the imprisoned mind had been made plain.

In the year 1887 something like the old interest was aroused by accounts of the brilliant deaf, dumb, and blind child in Alabama, Helen Keller. This child had lost sight and hearing at 19 months as a result of a serious illness. Like Laura she kept actively interested in all that surrounded her, and like Laura she developed her own little language of signs. When she was six years old, her friends, who knew of Laura Bridgman's case, applied to Boston for a teacher. In the following year Miss Annie M. Sullivan was sent. This lady was able to put herself in touch with Helen in a very short time and in a marvelous way. In fact, she has proved herself to be a most remarkable teacher. Following in general the methods adopted in teaching Laura, Miss Sullivan began her work by putting Helen in possession of the manual alphabet. A doll was happily chosen to begin with; and with the doll on the child's lap, the teacher formed in Helen's hand the finger letters *d-o-l-l*. Other familiar objects were similarly introduced, and strange as it may seem, that which had taken three months to reach in Laura's case in Helen's took but a few days; or, in Miss Sullivan's words, "it was not more than a week before she understood that all things were thus identified." Her teacher writes: "Never did a child apply herself more joyfully to any task than did Helen to the acquisition of new words. In a few days she had mastered the manual alphabet and learned upward of 100 names." After teaching verbs and prepositions through action and position Miss Sullivan made a departure. She began to use new words in connection with old words, letting Helen understand them if possible from the context. The child adopted these words "often without inquiry." In this way she became familiar with the use of many words whose meaning never had to be explained to her.

As to the letters of the raised alphabet, Miss Sullivan writes: "Incredible as it may seem, she learned all the letters both capital and small in one day." Then came the primer; then pencil writing than which there is scarcely a more difficult exercise for the blind to learn; and yet Helen "wrote without assistance a correctly spelled and legible letter to one of her cousins; and this was only a little more than a month after her first lesson in chirography." Braille, or tangible point writing, became a constant delight to her.

Words like "perhaps" and "suppose" and those indicative of abstract ideas she learned more through association and repetition than through any explanation of her teacher. The child had the language sense largely developed. Much of the time when no one was talking with her she was reading in books printed in raised letters. Dr. Bell in trying to account for Helen's wonderful familiarity with idiomatic English, considers of great significance the statement of Miss Sullivan, that, "long before she could read them [the books] . . . she would amuse herself for hours each day in carefully passing her fingers over the words, searching for such words as she knew." In 1888, when Helen was eight years old her teacher took her to South Boston, where she could have the advantage of all the appliances and embossed books that a school for the blind affords. Thenceforth an account of her progress reads like a romance. It was no more difficult for her to learn a new word in German or in Greek than in English; and she took great delight in picking up and using French or Greek phrases.

And when later she came to study these languages, she seemed to advance without effort in the knowledge of them. The educators of the deaf, who have good reason to comprehend the exceeding difficulty of teaching their pupils to articulate intelligibly, feel that Helen Keller's rapid mastery of speech is by all odds her most wonderful achievement. After she had been in South Boston some little time she heard of a Swedish girl afflicted like herself, who had learned to speak, and she said, "I must learn to speak." Miss Sullivan took her to Miss Sarah Fuller, principal of the Horace Mann School for the Deaf, and though Helen's only means of learning the position of the vocal organs in speech was to put her fingers on the lips, tongue, teeth, and throat of the speaker, she learned in 10 lessons to articulate so well that she could carry on an intelligible and audible conversation, having communication addressed to her spelled into her hand by the manual alphabet. She has learned since that time to read from the lips and throat of a speaker by placing her fingers lightly on them; so that any one sitting near her can converse with her just as though she could both hear and see. She spent a winter at the Wright-Humason Private School for the Deaf, where she improved her articulation. When Helen was 16 years old she entered the Cambridge School for Girls, Miss Sullivan accompanying her. There, under the guidance of Mr. Arthur Gilman, the director of the school, she took the course preparatory to entering Radcliffe College. At the end of one year she took the regular required examinations in the history of Greece and Rome, in English, in Latin, in elementary French, in elementary German, and in advanced German. As the questions and other matter were read into her hand by Mr. Gilman himself, Helen wrote her answers and translations on an ordinary typewriter. She passed the tests in every subject, taking "honors" in English and German. Mr. Gilman writes: "I think that I may say that no candidate in Harvard or Radcliffe College was graded higher than Helen in English." There are still other children afflicted like Helen who are doing splendid work, but, "taking this child all in all," says Dr. Job Williams, principal of the American School for the Deaf at Hartford, "and making due allowance for every possible aid that has been given her, and for all unconscious exaggeration due to friendly admiration, there yet remains so much that is marvelous as to place her beyond comparison with any other child of whom we have ever heard. The whole history of literature reveals nothing equal to her language productions from one of her years, even among those possessed of all their faculties. She is a genius, a prodigy, a phenomenon." The other deaf-blind children under instruction are some at schools for the blind, some at schools for the deaf. They must always have a special teacher, and use embossed books and adapted appliances. All are being taught on principles used in teaching Helen. In South Boston, where there are several, they attend classes with other pupils, the special teacher acting simply as interpreter and companion. See BLIND, EDUCATION OF; BRAILLE, LOUIS; FEEBLE-MINDED; HOWE, SAMUEL GRIDLEY.

Defence of Poesie, The. The title given to Sir Philip Sidney's 'Apologie for Poetrie' when printed for the second time in the third edition of the 'Arcadia' in 1598.

Defendant, in law, the party against whom a complaint, demand, or charge is brought, in a civil or criminal proceeding; one who is summoned into court, and defends, denies, or opposes the demand or charge, and maintains his own right. The term is applied even if the party admits the claim.

Defender of the Faith (*defensor fidei*), the title bestowed on Henry VIII. of England by Pope Leo X. (1521) in recognition of the monarch's great service to the Roman Catholic Church in writing his *Assertio Septem Sacramentorum adversus Martinum Lutherum* (vindication of the seven sacraments against Martin Luther). Pallavicini, in his history of the Council of Trent, describes the great satisfaction given to the papal court by King Henry's book and the modes suggested by various cardinals of acknowledging the obligation to the monarch. The Pope, with the aid of his secretary, Sadolet, had a form of bull drawn up conferring on Henry the title "Defender of the Faith." So that he might be on a par in the matter of titles relating to religion with the king of Spain's "Catholic majesty" and the king of France's "most Christian majesty," Henry was to be "Defender of the Faith." The draft of the bull was read to the college of cardinals and one of them suggested that the fittest title for the king of England would be "Orthodox King" or "Orthodox Majesty"; another proposed "Apostolic King"; a third "Angelic King." But Wolsey had already

signified to the court of Rome his royal master's choice of the title *Defensor Fidei* and accordingly that was adopted.

Defenders, a Roman Catholic association in Ireland (1784–98), the opponents of the Peep o' Day Boys.

Defensor Matrimonii, or **Defensor Vinculi Matrimonialis,** Defender of the Marriage Tie, an official in every episcopal jurisdiction of the Roman Catholic Church, whose duty it is in all cases of petitions or suits for judicial separation of married couples or for annulment on whatever ground of marriage contracts or of the marriage relation, to defend with all his power the validity of the contract and resist its abrogation. The Defensor is required to be in person present at every stage of the trial of a matrimonial cause, and he must have access to all the records and all the testimony. Not only may he, in case the court decides for the nullity of the marriage, appeal to a court of second instance; he is under obligation to appeal every single case; and if he demands it, he must be allowed a further appeal to the highest court. Nor is that all; he has the right, and it is his duty, to open the case anew if he finds there was any serious flaw in the judgment of nullity. In short, a matrimonial cause involving nullity of a consummated marriage contract is in the Church of Rome never finally and absolutely determined so long as either of the two parties to the suit is living.

Deffand, Marie de Vichy-Chamrond, mä-rē dė vē-shē-shäṅ-rôṅ dĕf-fäṅ, Marquise du, French letter writer: b. Château de Chamrond, France, 1697; d. Paris 24 Sept. 1780. Her acquirements were very considerable, but no care seems to have been taken to regulate her temper and disposition, which were marked by a high degree of selfishness, conspicuous throughout her life. In 1718 she married the Marquis du Deffand, from whom she separated after 10 years. During the latter part of her long life she became the centre of a literary coterie, which included some of the greatest geniuses of the age. Among women remarkable for their wit and talents in the 18th century Madame du Deffand claims a distinguished place, though she left no monument of her abilities except her epistolary correspondence, highly praised by D'Alembert as affording a model of style in that species of composition. During the last 30 years of her life she was blind. In 1810 was published 'Correspondence inédite de Madame du Deffand, avec D'Alembert, Montesquieu, le Président Hénault, la Duchesse du Maine; Mesdames de Choiseul, de Staël; le Marquis d'Argens, le Chevalier d'Aydie, etc.' Her letters to the celebrated Horace Walpole have likewise been printed.

Defiance, Ohio, city, county-seat of Defiance County; on the Maumee River, the Wabash, and the Baltimore & Ohio R. R.'s, and the Cincinnati and Toledo canal; 50 miles south of Toledo. It is a trade centre and has woolen-mills, bicycle factories, machine and carriage shops, a national bank, daily and weekly newspapers. Pop. 7,650.

Defiance College, a coeducational (nonsect.) institution in Defiance, Ohio; founded in 1884; reported at the end of 1902: Professors and instructors, 10; students, 125; volumes in the library, 3,000; grounds and buildings valued at $20,000; benefactions, $500; income, $2,500; number of graduates, 160; president, W. McReynolds.

Defila'ding, in military strategics, that branch of the science of fortification, the object of which is to determine, when the intended work would be commanded by eminences within range, the directions or heights of the lines of rampart or parapet, so that the interior of the work may not be incommoded by a fire directed to it from such heights.

Defile, in military language, is a narrow way, admitting only a few persons abreast. Hence to march before any one with a narrow front, in column or by files, is called defiling.

Definite Proportions, Laws of. See Atomic Theory.

Definition (from the Latin *definitio*) of a thing signifies, in lexicography, a concise account of its essential and characteristic points. A definition should embrace all the essential properties of the object intended to be defined, and not admit any which do not belong to it, which is often extremely difficult, on account of the shades and gradations by which different things are blended. The most simple things are the least capable of definition, from the difficulty of finding terms more simple and intelligible than the one to be defined. According to the old scholastic logic, a definition must give the mark of the genus (*nota generalis seu genus*) and of the species (*nota specialis seu differentia specifica*); for instance, a barn is a building (*nota generalis*) for the purpose of preserving corn, etc., (*nota specialis*). According to Aristotle every strict definition could be divided into two distinct parts; one dealing with the genus, and the other declaring the specific difference by which the given subject varies from others of the same order. Kant and his followers on the contrary make definition merely a list of essential marks summed up without any distinction between genus and difference.

In *optics* definition means the defining power of a lens — the giving of a clear and distinct image of an object together with all details of importance.

De Foe, Daniel, English journalist and novelist, author of 'Robinson Crusoe:' b. London 1659 (?); d. London 26 April 1731. He was the son of James Foe, a butcher, and was born in the parish of St. Giles, Cripplegate. The date of his birth used to be given as 1661 from a statement in the preface to his 'Protestant Monastry' (1727), that he was then in his sixty-seventh year; but Mr. G. A. Aitken has shown (*Athenæum,* 23 Aug. 1890) that he was born late in 1659 or early in 1660. Little is known of his early years save that he was bright and active and well grounded by his parents in the Bible and in Presbyterian theology. At about fourteen he was sent to a Dissenters' school kept at Newington Green by the Rev. Charles Morton, afterward vice-president of Harvard. Here he studied theology, the classics, French, Spanish, and Italian, mathematics, and history and geography — in the last named of which he later became extraordinarily proficient. In after years De Foe, defending the school, laid special emphasis on the instruction in English composi-

tion. His school course was intended to fit him for the Presbyterian ministry, Dissenters being not then allowed at the universities; but somewhere about 1678 he came to the conclusion that the position of a dissenting clergyman was not an enviable one and that he would do better to go into business.

Scarcely anything is known of his life for the next five years save that he was interested in public affairs during the "Popish Plot" and that he wrote — whether he published is doubtful — in favor of Austria against the Turks. In 1683 he was established in Cornhill, probably as a "hose factor," or wholesale dry-goods merchant. On 1 Jan. 1683–84 he married Mary Tuffley, by whom he soon had several children. It appears from his writings that he made voyages to Spain and Portugal and resided in Spain for a time, but no dates are given. Equally obscure is his share in the Monmouth uprising, yet it seems likely that he took part in that visionary enterprise and, unlike some of his old schoolmates, escaped being brought before Jeffreys. During the short reign of James II. he appears to have used his pen against the Declaration of Indulgence, but his tract or tracts cannot be identified, the 'Letter' believed by Lee to be De Foe's seeming to be Bishop Burnet's. In January 1687–88 he was enrolled in the Butcher's Company, thus becoming a liveryman of the city of London. About this time he resided at Tooting, where he was influential in founding a Presbyterian congregation.

At the close of 1688 De Foe joined the army of William III. at Henley, and ever after he made that monarch his special hero, praising him in his writings whenever he could. In 1691 he published his first definitely identified work, a satire on a recent Jacobite plot against William, 'A New Discovery of an Old Intrigue.' For many years he continued to essay poetry, but only on one or two occasions did he rise above mediocrity, his genius being essentially that of a prose-writer. In 1692 his affairs, which had probably been going wrong for some time, partly through the multiplicity of his interests, forced him into bankruptcy, with a deficit of £17,000. He went into hiding from his creditors, probably at Bristol. Then he compounded with them, and, according to the testimony of a journalistic rival, Tutchin, he later discharged in full obligations that had been scaled. Rejecting an offer to take charge of some business in Spain, he became secretary of a tile factory at Tilbury and was also for four years (1695–99) accountant to the commissioners of the glass duty. He seems to have had some reputation as a financier and he may have pleased the government by urging in a pamphlet a vigorous prosecution of the war against France ('The Englishman's Choice' 1694). By 1697 he had re-established himself in comfortable circumstances, and before the close of 1700 he had issued ten or more tracts dealing with the question of a standing army, with reformation of manners, with foreign affairs, and with the vexed problem of the occasional conformity of dissenters. The only one of these works that is of extended compass and interesting to the general reader is the 'Essay on Projects' (1698, but written four or five years earlier) in which he made numerous and often highly valuable suggestions about such matters of public interest as banks, insurance, good roads, asylums for idiots, and academies, especially for women, in whose welfare he was more interested than almost any other man of his time. But the tracts on occasional conformity were vigorous performances that gave anxiety to easy-going Dissenters, and his strong defense of William's policy in Spanish affairs, 'The Two Great Questions Considered' (Dec. 1700), while not influential with the public, probably helped him to obtain the confidence of that monarch when a little later he was introduced at court.

Defense of William was also the occasion of his publishing in January 1701 the best of his poems and the most popular of all his early works, his satire 'The True-born Englishman.' Much prejudice had been stirred up against the foreign-born king, and in rough but energetic verses De Foe turned the tables by dwelling with the mixture of stocks that made up the English people. Over 80,000 pirated copies were sold, and De Foe, who about this time for undeterminable reasons added the prefix to his name, for some years delighted to style himself on his numerous title pages "The Author of 'The True-born Englishman.' "

Between January 1701 and March 1702 on the eighth of which month King William died, De Foe probably issued about fifteen pamphlets. He still dealt with occasional conformity and foreign affairs, but he began more specifically to attack political abuses at home — corrupt elections to Parliament, the misdeeds of stock-jobbers, Jacobite intrigues, and the like. His powers as an acute arguer sure of making the average reader see his point and as a writer of homely, racy, fluent prose were now fully revealed. He also showed himself to be remarkably well informed on economic, constitutional, and diplomatic questions, and full of a sturdy patriotism of the Whig variety. The most noteworthy of the pamphlets of this period are his weighty assertion of 'The Original Power of the Collective Body of the People of England' (Dec. 1701) — a rebuke of the independence displayed by the high Tory members of Parliament, which would have been worthy of Somers himself; and 'Reasons against a War with France' (Oct. 1701) which to some students — though others take his reasoning literally — is the first of the tracts in which De Foe sought to attain his ends by irony and indirection — a war with Spain for the sake of colonial aggrandizement being his object despite the inevitably resulting struggle with France. 'Legion's Memorial' (May 1701) represents, however, the zenith of his short-lived popularity. The Tories had imprisoned the five presenters of the Kentish petition (of which De Foe wrote a 'History') and he thought it time to protest in the names of the many — Legion. He presented the 'Memorial' to Harley, the Speaker (in what disguise is not clear), and the house dared not resent the bold action. On the release of the petitioners De Foe sat by their side at a complimentary banquet.

Several poems on various subjects and a prose manifesto against the High Church party followed; then, at the end of 1702, De Foe returned to the attack on occasional conformity, which was destined to cost him dear. The High Churchmen in power had carried through the Commons a bill to prevent the practice, which

was, indeed, as De Foe held, a scandal from the point of view of consistency in ecclesiastical matters, but which, so long as occasional communion according to the rites of the Established Church was requisite to the holding of office, would certainly be pursued by ambitious Dissenters. De Foe's arguments were sincere and forcible, but unfortunately left him in an exposed position between the two firing lines. To strengthen himself, whether with the Dissenters, who thought him a deserter, or with the Whig leaders, he published in December 1702 his famous 'Shortest Way with the Dissenters,' in which, assuming the character of a High-Flyer, i. e., of an uncompromising churchman, he argued for the suppression of dissent by any means, no matter how cruel. It is hard to believe that he could have been taken seriously, but there is proof that he was. The Dissenters were alarmed that he should propose persecution at such a time of partisanship, even though he were in jest; and, when the High Churchmen discovered that they had been applauding a Dissenter who was really aiming to secure toleration, they were furious at being hoaxed. The result was that De Foe was prosecuted for libelling the Church, deserted by the Whigs, condemned after unfair proceedings, and sentenced to pay a fine, stand in the pillory, and be imprisoned. He stood in the pillory on July 29, 30, 31, 1703 but the people draped it with flowers and read his clever 'Hymn' to the instrument of shame.

It used to be thought that De Foe remained in Newgate until August 1704; but it now seems clear from his correspondence with Harley (published by the Historical Manuscripts Commission, 1897, 1899) that through the good offices of the latter he was released in the first half of November 1703. This not only disposes of the idea that he began his famous 'Review' in prison, but also makes it clear that he was not, as has been charged, drawing on his imagination when he described his personal experiences during and after the great storm of the end of November 1703 in his volume 'The Storm' published the next year. He was in prison long enough, however, for his business to go to ruin and his family to come to want, from which they were partially relieved by Harley. He had every reason to be grateful to that leader, and, although while serving him during the next ten years, De Foe did and said things which it is impossible to regard as honorable, his offenses are mitigated by his position of dependence and by the loose examples in political morality set by the leading men of the time.

During and immediately after his imprisonment De Foe continued industriously to publish poems and pamphlets, adding as new topics, not only the Storm, but the theological vagaries of John Asgill, regulation of the press, and the state of the Episcopalians in Scotland. His main achievement, however, was the establishment (17 Feb. 1704) of his newspaper 'A Review of the Affairs of France and of all Europe, as influenced by that Nation,' which, with the second volume, substituted for the last five words of its title, 'with Observations on Transactions at Home.' Beginning as a weekly, it speedily became a bi-weekly and then a tri-weekly. A literary supplement, supposed to be furnished by a 'Scandal Club,' appeared in 1704 and 1705. De Foe wrote practically the whole of the paper, which steered between the extreme Whig 'Observator' of Tutchin and the extreme Tory 'Rehearsal' of Leslie. Even when he was absent for over a year in Scotland, the numbers appeared regularly, and were doubtless of much assistance to Harley. They also spread De Foe's fame and influenced later journalists like Steele. After some changes in title and manner of issue the paper came to an end with its ninth volume (of which the British Museum copy is the only one known and even that is incomplete) on 11 June 1713. Its success entitles De Foe to be called the first great English journalist, whether or not his affectation of independence must give him a high place among casuists. It should be added that in the main he supported the constitutional and religious principles in which he believed and was constant in his endeavors to promote peace with honor, and commercial prosperity.

In the spring of 1704 De Foe was in frequent correspondence with Harley, and in the summer he took a trip through several counties to electioneer and gather information. He settled his family at St. Edmond's Bury, and, whether at home or on his journeys, was continually writing. Between July 1703, when he issued the first of two volumes of his collected writings — a pirated volume had appeared some months earlier — and the beginning of 1705, when the second volume appeared, he was responsible for more than twenty-five publications. The most important of these to the latter-day reader is the celebrated and able 'Giving Alms no Charity' (Nov. 1704) in answer to a bill for employing the poor — an attack upon pauper legislation in a tone strikingly modern. His letters of 1705 show that he was receiving pay but did not know whether it came from Harley's pocket or the treasury. He submitted his writings to his employer, communicated political intelligence, and in the summer and fall undertook another electioneering tour under an assumed name. Of the numerous publications of the year besides the 'Review' the most important is 'The Consolidator, or Memoirs of Sundry Transactions from the World in the Moon,' a rather heavy prose satire on Engilsh politics and ideas in general. He probably showed his knowledge of American affairs in 'Party Tyranny,' written in defense of the Non-Conformists of South Carolina, a subject to which he recurred a few months later. Early in 1706 he had a rough pamphlet duel with Lord Haversham in defense of the ministry, and discussed the new bankrupt law, a matter in which he was interested, as his creditors, stirred up by his numerous political enemies, were pressing him hard. Of the publications of the year the most important are the huge satire in verse 'Jure Divino,' most creditable to his learning and his political principles but impossible as poetry, and his famous 'Apparition of one Mrs. Veal,' which has no superior as a ghost story. The notion that this was composed to help the sale of Drelincourt's 'Fear of Death' was long since proved to be false; more recently Mr. Aitken has shown that De Foe merely reported with wonderful realism gossip current in Canterbury at the time.

The chief political events of 1706 were con-

nected with the proposed union between England and Scotland. In May De Foe began publishing a series of acute, well-informed, and conciliatory essays 'at Removing National Prejudices,' which by January 1707 amounted to six in number. Meanwhile in September 1706 at Harley's orders he had set out for Scotland to help on the negotiations at the meeting of the Scotch Parliament. From October 1706 to December 1707 he continued at his post sending full and interesting letters to Harley, interviewing leaders of every faction, encountering the violence of mobs, publishing pamphlets — in short, making himself valuable in every way. Except for an occasional visit to a disturbed centre like Glasgow, he remained in Edinburgh, and part of the time he was in attendance on parliamentary committees, serving them by his knowledge of English commerce and finance, and picking up information about Scotland of which he afterward made much use. The pity of it all is that he passed, part of the time at least, as "Alexander Goldsmith," swore that he was in Scotland on his own business and in nobody's pay, and yet was continually writing begging letters to Harley, who was not prompt in forwarding funds. During 1707, besides maintaining his 'Review,' he published a long poem 'Caledonia' and several pamphlets.

On his return to England De Foe found Harley in political difficulties and in February 1708 learned of his fall. He immediately wrote a good letter to his superior offering to share his fortunes, but Harley discountenanced such romantic notions and handed his useful agent over to Godolphin, whom De Foe served faithfully until Harley came into power in 1710. This meant that De Foe was regarded as a permanent secret service man and not as an official of dignified and regular status. He visited Scotland again in 1708 and in 1709, and supported warmly the Whig measures of Godolphin and Marlborough both in his 'Review' and in his pamphlets, which during these years apparently decreased in number. One reason for his not appearing oftener in his favorite rôle is probably to be found in the fact that he was at work upon his voluminous 'History of the Union of Great Britain' (1709) which, while scarcely interesting, is valuable and a clear proof of his interest in everything Scotch. In 1710 he naturally took his part in the Sacheverell controversy and on the dismissal of Godolphin he was glad to be employed once more by Harley. In the fall he visited Edinburgh as "Mr. Claude Guilot," for the purpose of undermining the Jacobites. By February 1710–11 he was back in London having frequent interviews with his chief and writing him letters full of suggestions and also of requests for money. Another visit to Scotland was made in the fall of 1712, but his travels in Harley's interest are not so important as the changed tone of the 'Review' and of the pamphlets of the period. De Foe had the hard or, rather, impossible task of maintaining outwardly his journalistic independence and at the same time of abandoning his support of the war and his general Whig attitude. He had to argue that the "High Flyers" would not be dangerous and to urge the election of moderate men to Parliament. On the whole, he was fairly consistent, opposing vigorously as he did the passage of the Occasional Conformity Bill and finding it no more unreasonable to hand over the American colonies of Spain to the Emperor than to let the Bourbon King of Spain keep them. But, of course, his path was a perilous one. The extreme Tories, who were powerful in the new Parliament, would not trust him, and the Whigs, whom he had deserted, detested him as a renegade. The modern reader, making allowance for the facts that it was a factious period, that regular party government was in its infancy, and that De Foe, both by his disposition and by his circumstances, was practically forced into his equivocal position between the Whigs and the Tories, finds it possible to admire the dexterity of his casuistry and the versatility and range of his activity. Between March 1710 and June 1713 when the 'Review' came to an end, he published more than thirty pamphlets, besides a book, 'The Present State of Parties' (1712) and a newspaper in Scotland ('The Edinburgh Courant' 1711). He dealt with Sacheverell, public credit, and loans (essays erroneously attributed to Harley), the extravagant partisanship of the "October Club," the advantages of the South Sea trade, the reasons for advocating peace and the treaty of commerce with France, the impolicy of the Occasional Conformity Bill, the political reputation of Harley, and the efforts of the Jacobites in favor of the Pretender. On the last topic he was specially effective. His five pamphlets (1712–13) are still readable, and one can well understand how the ironical 'Reasons against the Succession of the House of Hanover' should have fooled the stupid as much as his 'Shortest Way with the Dissenters' had done ten years before. This tract came near getting him into just as much trouble, a Whig named Benson bringing an action against him for treason based upon his having written as a Jacobite. De Foe injured his cause by discussing the case in the 'Review;' but Harley secured bail for him, and, after much maneuvring, since it was to the interest of both to keep their relations from being definitely known, however much they were suspected, he was finally pardoned under the great seal. The statement of his biographers that De Foe was a prisoner in Newgate between April and November 1713 is shown by his correspondence with Harley to be an error.

Between June 1713 and August 1714 when the fall of Harley and the death of Queen Anne brought a change to his fortunes, De Foe wrote many pamphlets (four of them forming an interesting 'General History of Trade') and labored upon two newspapers, 'Mercator, or Commerce Retrieved' and 'The Flying Post.' He warmly welcomed the new king and, feeling that he must as far as possible clear himself from the charges of being a turncoat and a mercenary writer, he published in January 1715, while he was still ill from an attack of apoplexy, his eloquent if not wholly ingenuous 'Appeal to Honor and Justice.' He was also most probably the author of the three parts of 'The Secret History of the White Staff' (1715), a defense of Harley, which that unpopular person felt obliged to declare the work of an opponent.

De Foe's bibliography now becomes exceedingly complicated. We may mention his elaborate manual of conduct, 'The Family

Instructor,' and, apparently, a 'History' of Charles XII. of Sweden. In the three or four years that elapsed before the appearance of the first part of 'Robinson Crusoe' (25 April 1719) he published anonymously a large number of pamphlets, two elaborate books ('Memoirs of the Church of Scotland,' 1717, and the second volume of 'The Family Instructor,') and two short biographies, and wrote constantly for three newspapers. He was one of the most conspicuous figures of the time, but was at no period admitted to the brilliant literary circles of Swift and Pope and of Addison and Steele. Meanwhile he had been convicted (July 1715) of libelling Lord Annesley by the declaration that his Lordship had tampered with the Irish troops in the interest of the Pretender, and it would have gone hard with him if he had not thrown himself on the mercy of Chief Justice Parker. The latter commended him to the Secretary of State, Lord Townshend, who found him very ready to serve the new government in a hazardous employment, to wit, as a spy in the offices of Jacobite newspapers. His chief connection of this sort was with 'Mist's Journal' from August 1717 to October 1724, with intermissions. He took the sting out of articles and kept the government informed of what the disaffected Tories were doing and writing, doubtless justifying himself by the thought that he was serving the best interests of Great Britain and the Protestant religion. Mist seems to have trusted him for many years; when he was undeceived (while in prison in 1724), he drew his sword on De Foe, who managed instead to wound the justly irate editor. There is simply no defense for De Foe's conduct; but it should be remembered that as Harley's man he had become inured to intrigue, and it is at least to his credit that his skill made 'Mist's Journal' popular. He continued to labor as an anonymous and outwardly renegade journalist, now editing his own paper — e. g., 'The Whitehall Evening Post' — now contributing leading articles to 'Applebee's Journal,' until 1726, long after his fiction had obtained popularity. Our knowledge of this portion of his career is due almost entirely to the researches of Mr. William Lee, who in the second and third volumes of his great work published the choicest of De Foe's articles, in which will be found some of the best of all his writings. Under the protection of Harley he had made himself the ablest political journalist of his time; left to his own devices, he became the ablest journalistic commentator on the general news of the day and on morals that England had yet known, with the exception, in certain particulars, of Addison. The later phase of his activity naturally fitted in with his writing of fiction and of utilitarian manuals, and in the combined functions he has probably exerted an influence on English literature second to that of no other writer.

De Foe had shown in 'Mrs. Veal' and in his description of the supposed destruction of the island of St. Vincent ('Mist's Journal,' 1718) his ability to write realistic narratives; but it was 'Robinson Crusoe,' founded on the adventures of Alexander Selkirk on Juan Fernandez, as told by Captain Woodes Rogers, that gave the great journalist a high standing among world authors. The story goes that De Foe had trouble in inducing a publisher to accept the book, and that William Taylor, who was shrewd enough to take it, made a fortune by it. It became popular at once, was pirated, printed as a serial, and translated into French, and subsequent editions, translations, and imitations have been almost numberless. A second part, 'The Farther Adventures of Robinson Crusoe,' was added in August 1719, and a third part, the 'Serious Reflections,' a group of essays now little read, appeared a year later. Neither the story that the first and best part was by Harley, nor the notion that De Foe used Selkirk's manuscripts, nor the theory that he gave in 'Robinson Crusoe' an elaborate allegory of his own life (partly supported by his language) will bear close investigation. That in his most famous book he made admirable use of a theme of universal interest, and that he employed in writing it all his resources as a realistic reporter and an imaginative projector, is proved by the position it has attained as a classic.

From the date of this success until 1727, that is from his sixtieth to his sixty-eighth year, De Foe's work is simply astounding both in quantity and in quality. Lee's quite incomplete list contains 44 items, 21 of which are good-sized books, and several of the remainder almost too large to be called pamphlets. To this period belong the picaresque stories 'Moll Flanders' (1722), 'Colonel Jacque' (1722), and 'The Fortunate Mistress' or 'Roxana' (1724) — unrivalled as studies in low life and showing growth on De Foe's part in character-drawing and plot-construction; the adventure stories of 'Captain Singleton' (1720) — remarkable for the knowledge displayed of African geography — and 'A New Voyage 'round the World' (1725) — interesting for its descriptions of the lower part of South America; the life of the famous teller of fortunes, 'Mr. Duncan Campbell' (1720); those portrayals of stirring historical epochs and episodes, 'Memoirs of a Cavalier' (1720 — generally attributed to De Foe), 'A Journal of the Plague Year' (1722) — probably De Foe's best work after 'Robinson Crusoe' — and 'Due Preparations for the Plague' (1722); and those popular manuals of conduct, the curious 'Religious Courtship' (1722), and the two parts of 'The Complete English Tradesman' (1725, 1727). To these books, most of them masterpieces, must be added a 'History' of Peter the Great (1723), probably De Foe's, a book on the servant question ('The Great Law of Subordination Considered,' 1724), three volumes of an early guide-book ('A Tour thro' the Whole Island of Great Britain,' 1724, 1725, 1726), 'The Political History of the Devil' (1726), and 'A System of Magic' (1726), at least eight pamphlets on famous criminals, such as Jack Sheppard, and several tracts on commercial, economic, and social topics — some of them published under the assumed name of Andrew Moreton. There is scarcely another such record of literary activity on the part of an aging man, and these multifarious productions illustrate his times better than is the case with the writings of almost any other author.

Between 1727 and his death De Foe published at least 20 books and tracts, among them 'Conjugal Lewdness' (1727), a well-meant but hazardous volume; 'History and Reality of Apparitions' (1728), 'A New Family Instructor' (1727), 'A Plan of the English Commerce'

(1728), and a number of pamphlets specially designed to promote the better civic government of London. It is pleasant to believe that his incessant labors enabled him to spend some of his last years in comfort at Stoke Newington; certainly, from the account of him given by his son-in-law Henry Baker, the naturalist, he must have had a fair income. About 1730, however, he seems to have deeded his property in trust for his wife and daughters to his second son, Benjamin, who apparently was false to his trust. De Foe, whether to escape some of his old persecutors, or because he was suffering from hallucinations, went into hiding, and in April 1731 died in London lodgings. Mystery surrounds his last days, and there are numerous passages in his more active period that need to be cleared up. The man's character, too, remains enigmatic, though we may be sure that he was neither the hero of the early biographers, nor the unprincipled mercenary and liar of many contemporaries and some latter-day critics. Fortunately there is little doubt that in his combined achievements as journalist, pamphleteer, realistic novelist, and miscellaneous purveyor of information and instruction he is unsurpassed among prose-writers.

Bibliography.— No edition of De Foe's works contains so much as a sixth of his writings. The best is that printed at Oxford in 20 volumes (1840–41). A good edition begun in 1840 by the younger William Hazlitt did not get beyond three volumes. 'The Compleat English Gentleman' and 'Of Royal Education' were first printed by Dr. Bühlbring in 1890 and 1895. There are two recent editions of the fiction — the excellent one in 16 vols., edited by Mr. G. A. Aitken (1895), and that of equal scope, by Dr. G. H. Maynadier (1904). The most important biographies are those by Walter Wilson (1830, 3 vols.— very valuable for its account of De Foe's times), by William Chadwick (1859 — rather eccentric), by William Lee (1869, 3 vols.— the second and third containing De Foe's newspaper articles); and by Thomas Wright (1894, useful, but disfigured by the curious theory that De Foe kept a vow of silence for a period equal to that spent by Crusoe upon his island). Consult, also, John Forster's 'Historical and Biographical Essays' (1858), Minto's 'Daniel De Foe' ('English Men of Letters,' 1879), and D. W. Rannie's 'Daniel De Foe' (The Stanhope Essay, 1890). Lee's bibliography of 254 items (slightly amended by Wright) has been accepted as the standard, but it admits several items De Foe most probably did not write, and omits more than 50 certain, probable and possible items. Lee's selections from De Foe's newspapers, although unsupported by much external evidence, seem to have been made with great skill.

WILLIAM P. TRENT,
Professor of English Literature, Columbia University.

De Fon'taine, Felix, American journalist: b. Boston, Mass., 1832; d. Columbus, S. C., 11 Dec. 1896. The first statement given to the North of the attack on Fort Sumter, was written by him; and he was correspondent of the Charleston *Courier* from the principal battlefields during the Civil War. Subsequently he went to New York, and was connected with the *Herald* much of the time until his death. He was the author of 'Cyclopæda of the Best Thoughts of Charles Dickens'; 'Gleanings from a Confederate Army Note-Book'; and 'Birds of a Feather Flock Together.'

De For'est, John William, American novelist: b. Humphreysville, Conn., 31 March 1826; d. New Haven, Conn., 17 July 1906. He passed many years in independent study and foreign travel, becoming proficient in several languages; entered the army as captain at the outbreak of the Civil War, and rose to major. Among his works are: 'History of the Indians of Connecticut' (1853); 'Oriental Acquaintance' (1856); 'Witching Times' (1856); 'European Acquaintance' (1858); 'Seacliff' (1859); 'Miss Ravenel's Conversion' (1867); 'Overland' (1871); 'Kate Beaumont' (1872); 'The Wetherell Affair' (1873); 'Honest John Vane' (1875); 'Justine Vane' (1875); 'Playing the Mischief' (1876); 'Irene Vane' (1877); 'Irene, the Missionary' (1879); 'The Oddest of Courtships; or, The Bloody Chasm' (1881); 'A Lover's Revolt' (1898); 'Overland' (1899); 'The De Forests of Avesnes and New Netherland' (1900).

DeForest Wireless Telegraph System, The. The inception of this system, invented by Dr. Lee DeForest, dates back to 1899. Dr. DeForest's idea was to develop a receiver, working on an electrolytic principle, which would be entirely automatic in its actions, requiring no tapping back or decohering arrangement like the coheror, but allowing the use of a telephone receiver for rapid and accurate work. The development of this receiver has steadily progressed until at the present time it appears to be far more sensitive than any other form, absolutely reliable in its action and enables operation over distances quite impossible with the coheror or magnetic detector from a given source of power at the transmitter. The electrolytic principles embodied in the receiver are as follows: When the electrodes on the small electrolytic cell consist of fine tentacles the small points or resistance of the cell will depend first upon the distance between the electrodes and, second, upon the applied motive force at the terminals of the cell. If the electrodes are extremely close together the resistance on the cell is normally very low. The passage of the electrical wave has the effect of decomposing the minute film of electrolyte between the electrodes and causing, by the sudden formation of gas, a great increase in the resistance of the cell. The normal conductivity is instantly restored upon the cessation of the electrical wave and the receiver rendered automatically sensitive for the succeeding impulse. If on the other hand the electrodes are removed a considerable distance from each other the cell will establish a counter electromotive force of polarization, which will almost completely oppose the passage of current from the electrical battery through the cell. In this case a minute layer of oxygen gas surrounds the exposed surface of the fine anode. The passage of the Hertzian wave now causes a sudden reabsorption, allowing temporarily a sudden increase in the flow of current.

The normal conditions of resistance and capacity of the DeForest receiver are extremely constant, which enables the use of a sensitive relay for operating a call bell or a tape recorder, a feature which is granted by no other form of automatic receiver known to-day in the wireless telegraph art. Moreover, this constantly allows

a far closer tuning or syntonization with this receiver than is afforded by the coheror, where the capacity and resistance are constantly varying factors, due to the continually re-arrangement of the filings under the repeated shocks of the tapping-back device. This has enabled the DeForest Company to attain more proficiency in tuning, allowing also long distances of transmission with comparatively small power. The DeForest System employs sound reading almost entirely, thus allowing greater speed and an ability to work through interferences from atmospheric disturbances, etc., due to the ability of the human ear to distinguish between the sounds of the true interfering signals.

The DeForest transmitter employs several novel features. Dr. DeForest was the first to use the alternating current transformer in place of the direct current interrupter and induction coil. He ordinarily employs 110 volts, 60 cycles alternating current, such as can be obtained generally from the electric light wires, and inserts a dry key or oil break key directly in this work. The current is stepped up a transformer to 20,000 volts and applied to the terminals of two batteries of Leyden jars arranged in series. In the oscillating circuit with these jars are included a spark gap, an adjustable syntonizing helix, by means of which the tuning on the transmitter is accomplished. The speed with which the operator can make the Morse signals with this key, the clearness of the spark, its instant response and freedom from flame, are marked characteristics of this transmitter. This same method is applied to 1 k.w. sets and to larger power up to 50 k.w. The 1 k.w. transmitters are good for 75 miles over land or 250 miles over sea-water, with a direct proportionate increase of distance with increase of power. In the larger sets glass plate condensers in oil are employed in place of the Leyden jars.

The DeForest tuning arrangement and the receiver differ distinctly from those employed by any other system. As an illustration of its efficiency may be cited the case of the stations at the World's Fair Grounds, Saint Louis Exposition. Here are located a 20 horse-power station for transmitting to Chicago and a small station at the steel observation tower for transmitting press dispatches to the Saint Louis newspapers. The station in the Electricity Building, located midway between these other two, can receive from either one *ad libitum* without the slightest indication of signals from the other, although less than a quarter of a mile distant from the station transmitting to Chicago. Simultaneously messages have been received from both transmitting stations at the same time from the same antennæ wire. The commercial adaptability of the system is best demonstrated by the fact that the Saint Louis station is now handling a large amount of paid commercial business with Springfield, Chicago, and Kansas City, distances of 100, 300 and 275 miles overland respectively. Remarkable distances have been covered over fresh and salt water by the DeForest system. The A. B. Wolvin has been in splendid communication with the Cleveland station while 75 miles north of Port Huron, in Lake Huron, a distance of 275 miles, considerable portion of which was overland. During the Russian-Japanese war the London *Times* maintained a continuous service reporting the war maneuvers in the waters of the Yellow Sea from on board their dispatch boat Haimun to the DeForest station at Wei Hai Wei. The greatest distance covered here was 275 miles, employing a 1 k.w. transmitter and less than 96 feet of antennæ wire. This service was maintained in the face of the continual operation of 20 or more ship sets belonging to the Japanese, Russians, English and German navies in these waters; and is the most striking proof of the efficiency of the method of receiving which employs the electrolytic responder and the telephone receiver. The United States Navy is now installing at Panama, Porto Rico, Cuba, Pensacola and Key West five of the largest stations in the world for regular commercial work, as well as for maintaining service with naval and merchant vessels. In all these stations the DeForest apparatus will be used; 35 k.w. is the power installed at the largest of these stations, as it is intended to eventually cover much greater distances than the 1,000 miles which separate four of the above mentioned stations.

Deformities. In medicine deformities are deviations from the normal development of some part or parts of the body. These may mar the appearance from the æsthetic standpoint, or they may be internal or unknown, resulting in serious disturbance of health, or having no influence on the life processes whatever. Deformities may be congenital or acquired, in the former case usually being the result of defective development, in the second to some disease process. A number of forms of defective development result in the production of monsters (q.v.). Special characteristic deformities are harelip, congenital dislocation of the hip, web-fingers, supernumerary fingers, club-hands, congenital club-foot, bow-legs, knock-knees, and various minor anomalies. The commonest forms of acquired deformities are usually due to some disease of the nervous system, as acute spinal paralysis, acute anterior polyomyelitis of children. This latter causes paralyses of the arms or legs, which result in deformities from insufficient growth. Hemorrhage of the brain frequently occurring during childbirth may result in hemiplegia in the infant, with consequent deformities. Rachitis or rickets frequently induces deformities. Other forms of acquired deformity are hammer-toe and acquired club-foot, the latter usually resulting from paralysis.

Defregger, Franz, frănts dā-frĕg-ĕr, German genre painter: b. Stronach 30 April 1835. The subjects of almost all his pictures are drawn from the Tyrolese peasant life, his few religious pictures having been in the main unsuccessful.

De Fu'niak Springs, Fla., town, county-seat of Walton County; situated on the Louisville & Nashville R.R., 80 miles northeast of Pensacola, and about 25 miles north of the Gulf of Mexico. The industries of the place are those of an agricultural and fruit-growing country. It is the site of a State Normal School, and the Florida Chautauqua. Its population increased nearly threefold between 1890 and 1900. Pop. (1900) 1,661.

De Gar'mo, Charles, American educator: b. Wisconsin 7 Jan. 1849. He was graduated from the State Normal University of Illinois in 1873, was principal of public schools, Naples, Ill., 1873–6; professor of modern languages at

the State Normal University 1886–90; and president of Swarthmore College 1891–8. Since 1898 he has been professor of the science and art of education at Cornell University. He has published: 'Essentials of Method'; 'Herbart and Herbartians'; 'Language Lessons.'

Degas, dė-gä, **Edgar Hilaire Germain,** zhăr-măn, French painter and engraver: b. Paris 19 July 1834. He was a pupil of La Mothe, and studied at the Beaux Arts in Paris. He is one of the most interesting members of the impressionist school, having worked in pastel, etching, dry point, and stone-engraving, producing numerous interiors of theatres, and café-concerts, foyers of the opera, views of the circus and of laundries, studies of dancers, etc., and all with a masterly touch. He also produced several portraits of Manet.

Degeneracy, a term much in vogue at the present time to indicate certain physical and mental peculiarities found in some individuals who are unable to keep up in the struggle for existence according to more ethical and honest methods. That abnormalities in ethical and mental development are apt to be associated with abnormalities in the human frame, is the central assumption on which this hypothesis rests, and in recent years the school of Lombroso in Italy, and its followers elsewhere, have developed a very one-sided series of studies on this general thesis. Thus the argument would read that, given 100 epileptics, it will be found that they show a very high percentage of physical anomalies in the way of variations in the configuration of the ear, modifications of the so-called normal palate, differences in the lengths of the arms and legs, changes in the color of the iris, and other physical anomalies. Like inferences are drawn from the study of idiots, defectives, the insane and criminal classes, and an entirely new school of criminology has been based upon the anthropometric rules of Lombroso. In the present discussion the word degeneracy is restricted to include only certain border-line conditions. In cases of frank idiocy, epilepsy, and insanity, sufficiently comprehensive terms are at hand to describe the conditions, whereas the term degeneracy is by modern students best reserved for those individuals in whom the ethical and moral developments show a non-normal character. It is therefore in the fields of criminology and abnormal psychology that the term has its deepest and widest application. The relationship of genius to degeneracy is much played upon by superficial writers. The term is an unfortunate one in large measure, as it offers an easy and convenient means of designation for a large and unsorted group of phenomena that are very imperfectly understood even by the most searching scholars.

Degeneration (in Pathology). In medical pathology degeneration is one of the processes that occur in the cells of an organ whereby different grades of disintegration and shrinking take place. It is one of the retrograde or breaking-down processes in contrast to those of abnormal growth and increase, although in many of the degenerations both processes are going on side by side. When abnormal intracellular metabolism slowly converts the cell plasma into useless and abnormal substances the process is known as degeneration, and then following upon such degenerations there usually results a partial or complete death of the plasma, leading to the destruction of the cell. In large measure, according to the character of the substances produced in the degenerative processes, various forms of degeneration are known. If in the organs there is a deposit of a waxy or lardy substance derived from the serum of the blood, the degeneration is known as amyloid degeneration. This is very frequently found in several organs at the same time, and results in large part from the infectious diseases accompanied by nutritional disturbances. Thus, in connection with chronic tuberculosis, syphilis, and chronic dysentery, amyloid degeneration is apt to occur. Hyaline degeneration is another form, which takes place in the connective tissue by which that type of cell is rendered homogeneous. Hyaline degeneration commonly occurs in the arteries and heart-valves, and is frequently associated with chalky infiltrations in these structures. Colloid degeneration occurs in certain forms of cancer in which the substance in the cells resembles softened glue. Mucous degeneration consists in the transformation of the leading tissues into a transparent, viscid, homogeneous mass consisting of mucins and pseudomucins. Mucoid degeneration takes place largely in the connective tissue in the epithelial cells, and sometimes as a result of the disturbance of the functions of the thyroid gland as in myxædema. Fatty degeneration is a degeneration in which fat globules are deposited in the cells. Albuminous degeneration, or cloudy swelling, as it is sometimes called, consists in a fine granulation of a number of cells in the body, particularly in the kidneys, liver, and brain. This acute degeneration is very frequently associated with fatty degeneration, and is due in great part to anomalies of nutrition largely produced by bacteriological agencies, as in the infectious diseases, and also at times to auto-intoxic products having their origin within the body itself as a result of perverted oxidation. Pigmentary degeneration is another form, in which are deposited in the cells small or large quantities of iron compounds derived largely from the blood and known as pigments. Consult: Hektoen, 'Text-book of Pathology.'

Degeneration, a work of Max Nordau (1895), which aimed at a scientific criticism of those degenerates not upon the acknowledged lists of the criminal classes. "Degenerates," asserted Nordau, "are not always criminals, prostitutes, anarchists, and pronounced lunatics; they are often authors and artists. These, however, manifest the same mental characteristics, and for the most part the same somatic features, as the members of the above-mentioned anthropological family, who satisfy their unhealthy impulses with the knife of the assassin or the bomb of the dynamiter, instead of with pen and pencil. . . . Now I have undertaken the work of investigating the tendencies of the fashions in art and literature; of proving that they have their source in the degeneracy of their authors, and that the enthusiasm of their admirers is for manifestations of more or less pronounced moral insanity and dementia."

Degeneration as a Factor in Evolution. Degeneration, in biology, is a term used to describe those not unfrequent cases where an entire organism falls below the structural level of its young stages, or where an organ in the

same way loses its fullness of function, and becomes more or less atrophied, abortive, and simplified. Thus many parasitic worms, crustaceans, etc., are emphatically simpler than their free-swimming larvæ, and the sessile adult ascidian shows only traces of the vertebrate characters which are plain enough in the active young. Thus too, a crustacean which starts with a well-developed eye, may exhibit the gradual loss of this on assuming a dark habitat. The term is best confined to cases where a level of structure exhibited during early life is more or less lost in the adult. Degeneration must be distinguished (1) from occasional abortion; (2) from reversion to an ancestral type; and (3) from the occurrence of rudimentary and undeveloped organs where a character possessed by ancestral types remains more or less undeveloped, or shows itself only in embryonic life. Degeneration may be due to the environment, or to cessation of function, or to some more subtle constitutional cause. Absence of food, heat, light, etc., may mean the absence of the necessary stimulus for the growth and maintenance of the organs; or superfluity of food may cause one system to preponderate over others. Nor can it be doubted that cessation of function checks the food-supply to a given organ, and in other ways helps to bring about its degeneration. But on the other hand, some less obvious cause — the fatigue of early life, a constitutional sluggishness, etc., may share in conditioning degeneration, as in the case of the majority of the *Tunicata*. Weismann and others, however, would explain degeneration by what they call the non-operation of natural selection. On this view, organs are not only developed but maintained by natural selection; and if it happen that an organ is no longer an advantage in this struggle for existence (for example, eyes in dark caves), then natural selection no longer maintains that organ, and it disappears in the course of generations. Weismann applies this ultra-Darwinian conception especially to cases which might be called non-development rather than actual degeneration — for example, to the slightly developed wings of the *Apteryx*. Most cases of degeneration properly so called appear hardly to require his subtle explanation, but find a sufficient one in the nature of the environment, in the effects of stopped function, and in the constitution of the organism. The theory of the degeneration of man from a high state has been superseded by the belief in a development from low savagery (see ANTHROPOLOGY; ARCHÆOLOGY). Consult: Lankester, 'Degeneration'; Weismann, 'Ueber den Rückschritt in der Natur'; Nordau, 'Degeneration.' See also ENVIRONMENT; EVOLUTION, etc.

Deger, dāgĕr, **Ernst,** German painter: b. Bockenem, Hanover, 15 April 1809; d. Dusseldorf 27 Jan. 1885. He was a pupil of Wach and Schadow, in Berlin and Dusseldorf, becoming a painter in oil and of frescoes, and giving much attention to the latter form of work. He decorated the chapel at Castle Stolzenfels for Frederick William IV. of Prussia, becoming in 1869 professor at the Dusseldorf Academy and member of the Berlin and Munich academies. Among his works are: 'Pieta' (1830); 'Bearing the Cross' (1832); 'Annunciation' (1834); 'Virgin Adoring Christ' (1836); 'Madonnas and Seven Scenes from the Life of Christ' (1841–51), in St. Apollinaris' Chapel, Remagen; 'Adam and Eve' (1853), Raczynski Gallery, Berlin. His works are noted for vigor and finish. He was a leader of the so-called "Nazarean School."

De Gérando, Joseph Marie, zhō-zĕf mä-rē dĕ zhā-räñdō, BARON, French philosopher and statesman: b. Lyons 29 Feb. 1772; d. Paris November 1842. On the siege of Lyons in 1793 he took up arms in its defense, and greatly distinguished himself by his bravery, but was subsequently obliged to flee. He returned to France on the proclamation of an amnesty, and joined a cavalry regiment. While in garrison at Colmar he composed an essay on the theme proposed by the French Institute, 'Quelle est l'Influence des Signes sur l'Art de Penser?' and gained the prize. In 1799 he took office under Lucien Bonaparte as minister of the interior, and became secretary-general of that department in 1804. In 1811 he was made a councilor of state, and in 1812 governor of Catalonia. In 1819 he commenced a course of lectures in the Faculté de Droit, in Paris, on public and administrative law, suspended in 1822, and resumed in 1828. He was raised to the peerage in 1837. De Gérando acquired great fame by his philosophical writings, in which he follows with some deviations the school of Condillac. His principal works are: 'Des Signes et de L'Art de penser considérés dans leur Rapports Mutuels' (1800), an enlargement of the dissertation formerly written for the French Institute; 'De la Génération des Connaissances Humaines' (1802); 'Histoire comparée des Systèmes de Philosophie' (1804), completed after his death; 'Du perfectionnement Moral et de l'Education de Soi-même,' a treatise which gained the prize of the French Academy in 1825; 'De l'Education des Sourds-muets de Naissance' (1827); 'Institutes du Droit administratif Français, ou Eléments du Code administratif réunis et mis en ordre' (1829–45); 'De la Bienfaisance Publique' (1839).

Deggendorf, dĕg'gĕn-dôrf, Germany, a town of Lower Bavaria, near the Danube, 39 miles northwest of Passau. It has manufactures of paper, linen, woolens, stoneware, and matches. Its Church of the Holy Sepulchre is visited annually by a large number of pilgrims. Pop. (1900) 6,843.

Degluti'tion, the physiological act of swallowing, or the process by which food is conveyed to the stomach.

Degradation of clerics in the Roman Catholic Church has two degrees, being either "verbal" or "actual." By "actual" degradation the offender, besides being deposed from the ministry, is deprived of his order and of the canonical privileges attached to his order, and in particular is delivered over to the secular arm for punishment; nor does any one who makes a violent assault on him incur the excommunication decreed against whoever violently attacks a cleric or a monk. By "verbal" degradation the cleric is deprived of all his clerical functions and stripped of his Church benefice if he holds any; but he retains the privileges of his order, and is not handed over to the secular power; he has right of appeal to ecclesiastical courts. If his offense merits imprisonment he must be shut up in some monastery or other ecclesiastical establishment; and though he is degraded, still were one to make

an assault on him the assailant would, *ipso facto,* incur excommunication. Nevertheless, since the sacrament of order imprints an indelible character, the degraded cleric, whether by actual or verbal degradation, is still priest or deacon or whatever he was before in the ministry; and his purely sacerdotal and sacramental acts, even his priestly absolution, if given *in articulo mortis* or in grave peril of death when no priest in full Church communion is at hand, is valid. So, too, his celebration of the mass is valid though sacrilegious.

The process of actual degradation is as follows: The culprit, in the attire of his order and bearing in his hands some instrument of his clerical functions, a chalice or a mass-book, is brought before the bishop. That emblem of his priestly state is taken away from him; then he is stripped of his ecclesiastical attire, and his head is shaven to obliterate the mark of the clerical tonsure. Finally the bishop addresses him in these words: "By the authority of God Almighty . . . we take away from thee the clerical habit and depose, degrade, and deprive thee of all order, benefice, and clerical privilege."

De Grasse, Comte. See GRASSE, COMTE DE.

Degree, in universities, a title and badge, accompanied with a certificate, conferred on the student, after examination, as a testimony of his proficiency in certain branches of knowledge, and entitling him to certain privileges. Some degrees are conferred, without previous examination, in general recognition of the graduate's eminence in the literary, philosophical, or scientific world. These are called honorary degrees. The degrees are much the same in all universities; but the regulations regarding them, and the previous discipline or studies, differ. The original degrees are bachelor, master, and doctor, to which many modifying characters are added, according to the faculties of arts, law, divinity, medicine, science, literature, etc., in which each degree is taken.

In music, a step ascending or descending the tone-ladder. It may consist of a semi-tone, a tone, or (in the minor scale) of an augmented tone. When the notes are on the same line or in the same space, they are of the same degree. The interval of a second is one degree, the interval of a third two degrees, and so on, irrespective of the steps being tones or semi-tones. Hence, also, notes are in the same degree whether they are natural, flat, or sharp, of the same note, as C and C sharp, E and E flat; and they are in different degrees when, though the same note on an instrument of fixed intonation, they are called by different names, as F sharp and G flat, C sharp and D flat.

In mathematics, a unit in a scale of measurement; specifically, in algebra, the amount reached by adding together the exponents of the faciento or variables contained in any single term of an equation or expression; and in trigonometry, the unit of measurement for arcs, or the angles they subtend.

Degree. See ANGLE; CIRCLE.

Degrees of Latitude and Longitude. Degree of latitude is the space or distance on the meridian through which an observer must move to vary his latitude by 1°, or to increase or diminish the distance of a star from the zenith by 1°; and which, on the supposition of the perfect sphericity of the earth, is the 360th part of the meridian.

Degree of longitude is the space between the two meridians that make an angle of 1° with each other at the poles, the quantity or length of which is variable, according to the latitude.

Degrees, Measurement of. After Newton had taught that the earth, on account of its motion round its axis, must be highest near the equator, and that the diameter of the equator must be longer, by one 230th part, than the diameter from pole to pole, the French wished to investigate the subject further by actual measurement. The measurement was begun with the result that the axis of the poles was found to be longer than a diameter of the equator, and that the earth was, in form, more like a lemon than an orange. For 40 years disputes were maintained on this point without settling the question; and at last the Academy of Sciences resolved, on the proposition of Condamine, to have a degree measured at the equator (the expedition went to South America in 1735), and one in Lapland (Kittis and Tornea being the extreme stations to which the expedition was sent in 1736). It was found that the northern degree was greater than that under the equator, and that Newton's conjecture was right. But the question still remained, How great is the flattening of our planet? The theory said one 230th part, if the earth had been in a perfectly liquid state when it began its rotation. The calculations, however, always gave different results, varying according to the different measurements adopted as the basis of them; for measurements had been made, not only in America and Lapland, but also in France, England, Hungary, and Italy. When the French established their new and admirable system of measures and weights upon the basis of the metre, which was to be the ten millionth part of the distance from the equator to the pole (3.2808992 English feet, or 39.37 inches), it was necessary to know with accuracy the circumference and the flattening of the earth. A measurement, therefore, took place in France, not of one degree, but of 10 degrees, from Dunkirk to Formentera, one of the Balearic Islands. In Sweden in 1802 the degree, which 80 years before had been measured by Maupertuis, was now measured again with better instruments, and thus the circumference and flattening of the earth were pretty well ascertained. After the Peace of Amiens the measurements of degrees just made in England, under Gen. Roy, by Lieut.-Col. Mudge, were connected with those in France; and thus an arc of 20 degrees, from the Balearic Islands over France and England, to the Orkneys, was measured, and the flattening of the earth calculated to be 1-304th (the most recent estimate being 1-292). In India, the measurement of a degree, begun by Lambton, was continued by Everest and completed by Walker. The measurement of an arc of 25° 20′ from Hammerfest to Ismailia was completed in 1855. Similar measurements have been continued to the present time, and at the Geodetic Congress in London in 1900, it was announced that English experts were engaged in measuring an arc of the meridian of 104° from Cape Colony to Alexandria, and had made considerable progress.

The annexed table shows the lengths of a degree of longitude for places at every degree of latitude from 0° to 90°. It is computed on the supposition that the earth is a sphere.

Deg. lat.	Eng. miles	Deg. lat.	Eng. miles	Deg. lat.	Eng. miles
0	69.07	31	59.13	61	33.45
1	69.06	32	58.51	62	32.40

30	59.75				

Measurement of a Degree of Longitude.— The degrees of longitude are largest under the equator, and diminish continually toward the pole. Under the equator a degree of longitude contains 60 geographical, 69.16 statute miles. If the form of the earth is not entirely regular, the degrees of longitude on the same parallel of latitude cannot all be of the same length; and it has been proposed to investigate this by actual measurement. This task is, in the trigonometric part, as easy as the measurement of a degree of latitude; but in the astronomical part it is 15 times more difficult. The difference of the longitude of two places is determined by the difference of the hour of the day at the same point of time in the two; as a place situated 15 degrees to the east of another has noon a whole hour earlier. One hour, therefore, corresponds to 15 degrees, or 1,042½ statute miles, under the equator, or 5,504,400 feet; a minute of time to 91,740 feet, and a second of time to 1,529 feet. A mistake of a second of time, therefore, in calculating the longitude of two places, makes a corresponding error in space. To determine time within two or three seconds, by means of rockets, at a distance of 1,042½ miles is impossible; and while the measurement of an arc corresponding to this distance trigonometrically, may be attended with an error to the amount of 200 feet, an astronomical measurement would leave an uncertainty of 2,000 feet. The earlier measurements of the French were directed. in the north, by Maupertuis; in the south by Bouguer. Since that time measurements have been made in all the great continents of the globe — in Pennsylvania, in the time of Maskelyne, by Mason and Dixon; at the Cape of Good Hope by Lacaille, completed by Maclear; in Prussia by Bessel; in Russia by Struve; in Denmark by Schumacher; and in England by Roy Kater, and Colby. The French arc from Formentara to Dunkirk was measured by Mechain and Delambre. The results of the measurements, as given by Airy, make the equatorial diameter 7925.648, and the polar diameter 7899.170 miles. Bessel's results are almost identical, namely, equatorial diameter 7925.604, and polar diameter 7899.114 miles. There is an international association, having as its main object the correlation of all degree measurements and connected data with the view of accurately ascertaining the figure of the earth.

De Haas, dē häs, **Maurice Frederick Hendrick,** American marine painter: b. Rotterdam 12 Dec. 1832; d. 23 Nov. 1895. He studied in England and at The Hague under Louis Meyer, and in 1857 was appointed painter to the Dutch navy. In 1859 he came to the United States and opened a studio in New York which remained his home henceforth. Among his paintings are: 'Admiral Farragut's Fleet passing New Orleans'; 'Coast of France'; 'Sunset at Sea'; 'Moonlight at Sea'; 'Sunset at Pigeon Cove'; 'Sunrise in a Fog at Newport'; 'Shipwreck'; 'Menhaden Boats off Long Island'; and 'Off Marblehead.'

De Haven, Edwin J., American naval officer and explorer: b. Philadelphia 1819; d. there 2 Oct. 1865. He entered the navy in his 10th year and resigned in 1857. He commanded the expedition which left New York in 1850 to search for Sir John Franklin.

Dehorning, the act or practice of depriving animals, specifically cattle, of their horns. Clippers or shears have been invented for the operation, wherewith it is performed quickly and with comparatively little pain, and scarcely any disturbance of the animal's normal functions or condition. The most favorable conditions of weather, etc., should be chosen for it, and the aid of a skilful operator is desirable. When all features of cruelty or unnecessary pain are avoided, there is believed to be much to justify the practice of dehorning, inasmuch as it tends, among other benefits, to convenience, safety, and comfort in the handling of cattle, especially during their transportation from place to place.

Dehra Dun, dĕh'rä doon. 1. A district in the Northwest Provinces, British India. It lies at the base of the Himalayas. Good roads, cultivated fields, hedges, streams flowing through meadows all, in parts of this district, look like some of the old country districts of the well-cultivated parts of Europe. The area is 1,193 square miles; pop. 170,252. 2. Dehra is the name of the chief town or capital of the district. It has an English garrison and contains a number of European inhabitants. Pop. 27,813.

Dei Gratia, dē-ī grā'shĭ-a (Lat. "by the grace of God"), a formula which many European sovereigns add to their title, and which is taken from an expression of the apostle Paul in the New Testament. It was first used by the clergy in the time of Constantine the Great, as an expression of dependence upon the grace of God; and afterward the higher clergy came to use along with it the addition *et apostolicæ sedis* (by the grace of God and the apostolic see). In the time of the Carlovingian race the secular princes also assumed it; and in course of time it came to be regarded as asserting something

like the divine right of kings and their independence of any earthly power. The expression has been made use of on the coins of many nations.

Deiamba, dā-yăm'bạ, Congo tobacco, a plant growing wild in the marshy districts of Congo, Africa, the flowers of which produce a narcotic effect when smoked.

Deianira. See DEJANIRA.

Deidam'ia (*Deïdameia*), daughter of Lycomedes: she bore Pyrrhus and Oneirus to Achilles, during his abode at Scyrus.

Deiler, John Hanno, American educator: b. Altoetting, Upper Bavaria, Germany, 8 Aug. 1849. He was graduated at the Royal Normal College, Freising, and studied at the Royal Polytechnic Institute, Munich. He taught in the public schools of Munich until 1871, and was principal of a German school in New Orleans 1872–9. He has been professor of German in the University of Louisiana and Tulane University since 1879. He has been connected with various German societies in New Orleans, and has published 'Das Redemptions-System im Staat Louisiana'; 'Geschichte der Deutschen Kirchengemeinden im Staat Louisiana'; 'Geschichte der Einwanderung von 1820–1896'; 'Deutschen Gesellschaften von New Orleans'; etc.

Deimos (dī'mōs) and **Pho'bos,** the names respectively of the outer and inner satellites of Mars, discovered by Prof. Asaph Hall in the summer of 1877, with the 26-inch equatorial of the Washington Observatory. Deimos revolves about its primary in 30 hours and 18 minutes, while Phobos, a most extraordinary body, accomplishes its revolution in 7 hours, 39 minutes, and 14 seconds, being at a distance of only about 3,700 miles from the surface of Mars.

Deioces, dē-ī'ō-sēz, Median king: fl. about seven centuries B.C. He rose from a private station to be the founder of the Median empire. By acting as arbitrator in the disputes which took place in his own vicinity, he had acquired a high reputation for wisdom and justice; and when the Medes, in consequence of their revolt from the Assyrians, stood in need of a sovereign, they found none whose claims to the honor seemed stronger than those of Deioces. Immediately after his election he assumed great state, surrounded himself with body-guards, and built the city of Ecbatana, in the centre of which he resided, almost wholly hidden from public view, transacting all business by deputies. His administration was vigorous, and after a peaceful reign of 35 years he was able to transmit the throne, without a contest, to his son Phraortes.

Deiotarus, dē-ī-ŏt'ạ-rus, Galatian tetrarch: d. 30 B.C. He received from the Roman senate the title of king of that province and Armenia Minor, on account of services rendered to the Romans in the Asiatic wars. In the civil war he joined the party of Pompey. Cæsar took from him Armenia, obliged him to march with him against Pharnaces, and left him nothing but the title of royalty. He was accused of having plotted against the life of Cæsar, from which charge Cicero defended him in an oration yet extant. After the murder of Cæsar he returned to his dominions, joined Brutus, and afterward Augustus.

Deiphobus, dē-ĭf'ō-bŭs, in Greek legend the son of Priam and Hecuba, who married Helen after the death of Paris, but was betrayed by her to the Greeks.

Deipnosophist, dē-ĭp-nos'ō-fĭst (from the Greek *Deipnosophistæ,* learned men at dinner), one of an ancient sect of philosophers famed for their learned conversation at meals. The work or rather compilation, 'Deipnosophistæ,' of the celebrated Greek grammarian and rhetorician, Athenæus, who flourished about two centuries before Christ, has preserved to posterity thousands of quotations and names of authors to the number of 700, that otherwise would have been lost. The "learned guests" in his voluminous work numbered 29, who meet and banquet for days, entertaining one another with excerpts which Athenæus must have gathered at great pains and labor from the library of Alexandria, afterward destroyed. The titles of books he puts into the mouths of his characters alone number 2,500.

Deira, dē'ī-rā, the name of an ancient Anglican kingdom. The date of the origin is unknown, but prior to the 6th century A.D. the territory extending from the Humber to the Tees, now included in the present Yorkshire, England, was known by that name. About the year 600 A.D. it was united with Bernicia to form the kingdom of Northumbria, later created an earldom.

Deir el-Baheri, dār-ĕl-bäh'rē, or **Der el-Bachri,** is a temple seat in the district of Thebes, on the west bank of the Nile, opposite Karnak, which is about five kilometres distance from it. At Der el-Bachri are some remarkable ruins of a temple built on terraces up the hillside which edges the alluvial plain. This is known as the temple of Queen Ratasu. The building is probably contemporary with those of Luxor and Karnak, being erected in the same style of magnificence.

Deir-el-komar, kā'mär ("convent of the moon"), a town of Syria, formerly the capital of the Druses, 13 miles south-southeast of Beyrout. It is situated on the edge of a deep and picturesque glen of Mount Lebanon, on the opposite side of which stands the palace Bteddin, the summer residence of the Christian governor of Lebanon. The town's chief industry is the making of embroideries and rich stuffs. Pop. 8,000, mostly Maronites.

Deira, dē'ī-rạ, an ancient Anglian kingdom stretching from the Tees to the Humber, and extending inland to the borders of the British realm of Strathclyde. With Bernicia it formed the kingdom of Northumbria. The union between Bernicia and Deira seems to have been rather unstable, for it was only under Edwin, Oswin, and other strong kings, either of Deiran or Bernician blood, that a real united Northumbria existed; and when the struggle for supremacy among the English kingdoms resulted in the triumph of Wessex, the two northern kingdoms were allotted to separate earls. Finally Deira became a kingdom under the Danes. The story seems to be authentic, that the slaves who attracted Gregory I. in the slave market of Rome, were from Deira.

Deism (Lat. *deus,* God), a philosophical system which, as opposed to Atheism (Gr. *a,* not, and *Theos,* God), recognizes a great First Cause; as opposed to Pantheism (Gr. *pan,* all, *Theos*), a Supreme Being distinct from nature or the universe; while as opposed to Theism, it

looks upon God as wholly apart from the concerns of this world. It thus implies a disbelief in revelation, as set forth in the Old and New Testaments, scepticism as regards the value of miraculous evidence, and an assumption that the existence of Deity can be proved by natural reason alone, unaided by spiritual or religious intuition. While Deism cannot be attributed to any one country or epoch, it seemed to have its fountain-head in England during the end of the 17th and first half of the 18th centuries.

Deissman, dīs'män, **Adolf,** German theologian: b. Langenscheid, 7 Nov. 1866. He was educated at Tübingen and Berlin, and has been professor of New Testament exegesis and criticism at the University of Heidelberg from 1897. He has published 'Johann Kepler und die Bibel' (1894); 'Bibelstudien' (1895); 'Neue Bibelstudien' (1897); 'Theologie und Kirche' (1900).

Deist, one who admits the being of a God, but denies the existence or even necessity of a divine revelation, believing that the light of nature and reason are sufficient guides in doctrine and practice; a believer in natural religion only; a freethinker.

Etymologically the words deist and theist are the same in meaning, only deist is from Latin and theist from Greek. Conventionally, however, they are widely different in import; the term theist being applied to any believer in God, whether that believer be a Christian, a Jew, a Mohammedan, etc., or a deist properly so called. A deist is, as the definition states, one who believes in God, but disbelieves in Christianity, or more generally in revelation.

The term Deists, or Freethinkers, is usually employed to designate a series of writers who appeared in England in the 17th and 18th centuries, and sought to establish Natural Religion upon the basis of reason and free inquiry, in opposition to all positive religions, and without reference to supernatural revelation. They were critical, if not hostile, in their attitude toward Scripture.

Deistic, or **Deistical,** pertaining to deism or the deists, containing the doctrines of deism or Natural Religion.

Also a term applied to a controversy which arose in England in the 17th and 18th centuries, between those who believed and those who disbelieved in revelation; the latter, however, not occupying the atheistic standpoint, but accepting as a settled point belief in a personal God. The first, in point of time, of the celebrated English deists was Lord Herbert of Cherbury, the publication of whose work, 'De Veritate,' which appeared in Paris in 1624, began the controversy. There followed, on the same side, Hobbes, Tindal, Morgan, Toland, Bolingbroke, Paine, and others. The standard work on the subject is the Rev. Dr. John Leland's 'Deistical Writers,' first published in 1754.

Dejanira, dĕj-a-nī'ra, in Greek mythology, a daughter of Œneus, king of Ætolia. Her father promised to give her in marriage to him only who proved to be the strongest of all his competitors. Hercules obtained the prize, and married Dejanira, by whom he had three children. When Nessus, a centaur, who had offered violence to Dejanira, was dying by a poisoned arrow shot from the bow of Hercules, she accepted from him the present of his tunic, which Nessus said had the power of reclaiming a husband from unlawful loves. Accordingly, when Hercules became enamored of Iola, daughter of the king of Œchalia, she sent him the centaur's tunic, which caused his death. Dejanira was so disconsolate at this event that she destroyed herself.

Déjazet, dā-zhä-zā, **Pauline Virginie,** French actress: b. Paris 30 Aug. 1797; d. 1 Dec. 1875. On the stage before she was five years old, she grew up playing children's and boys' roles with marvelous precocity of intelligence and grace. In 1821 she began to play at the Gymnase, but her greatest triumphs were won at the Théâtre du Palais-Royal, whither she betook herself in 1834. She left the boards in 1868, and the next year received a pension of 2,000 francs. See 'Lives,' by Lecomte (1866), Duval (1876).

De Kalb, Johann, yō'hän dĕ kälb, French soldier: b. Huttendorf, Bavaria, 29 June 1721; d. Camden, S. C., 19 Aug. 1780. He was educated in the art of war in the French army. In 1762 he visited the Anglo-American colonies as a secret agent of the French government. He was a brigadier in the French service, when, 7 Nov. 1776, he made with Franklin and Silas Deane an engagement to serve in the forces of the revolted colonies; and in 1777 he accompanied Lafayette to America. Congress appointed him a major-general 15 Sept. 1777, after which he joined the main army under Washington, and was active in the events near Philadelphia, which preceded the encampment at Valley Forge. He served in New Jersey and Maryland till, in April 1780, he was sent to reenforce Gen. Lincoln, then besieged in Charleston. He was second in command under Gen. Gates; and in the disastrous battle of Camden, 16 Aug. 1780, was at the head of the Maryland and Delaware troops, who maintained their ground till Cornwallis concentrated his whole force upon them. He fell in the charge upon his regiments before they gave way. He died at Camden three days afterward, and a monument was erected there to his memory in 1825, Lafayette placing the corner-stone.

De Kalb, Ill., city in De Kalb County, on the Chicago & Northwestern Railroad, 60 miles west of Chicago. The industries of the city are the manufacture of wire and other iron products, glove and shoe manufacturing and agricultural machinery. De Kalb has 3 banks with a combind capital of $350,000. The city is governed by a mayor and council of 10 members, elected for two years, and owns its own water-plant. The Northern Illinois State Normal School is located here. Pop. (1904) 6,000.

De Kay, Charles, American poet, grandson of Joseph Rodman Drake: b. Washington, D. C., 25 July 1848. He was educated at Yale and has been for many years the literary and art editor of the New York *Times*. His poems are mostly founded on themes from Oriental, classical and literary history. Among his works are: 'The Bohemian' (1878); 'Hesperus and Other Poems' (1880); 'The Vision of Nimrod' (1881); 'The Vision of Esther' (1882); 'The Love Poems of Louis Barnaval, by Charles De Kay' (1883).

Deken, dā'kĕn, **Agathe,** Dutch author: b. Amstelveen, near Amsterdam, 14 Nov. 1741; d. 14 Nov. 1804. She wrote a number of novels

with her friend Elizabeth Bekker (q.v.) and poems, among them 'Lideren voor den Boerenstand' and 'Liederen voor Kinderen.'

Dekker, Eduard Douwes, ĕd'oo-ärd doo'vĕs dĕk'kĕr, Dutch novelist, pseudonym «MULTATULI»; b. Amsterdam 2 March 1820; d. Nieder-Ingelheim 19 Feb. 1887. He spent several years in government service in the Dutch East Indies. His story, 'Max Havelaar' (1860), is a shocking accusation of wrongs and scandals against the Dutch administration of Java. He later published many satirical works on social, political, and philosophical questions, among them a volume of admirable 'Parables'; a novel, 'The Blessed Virgin'; a drama, and 'The School of Princes.'

Dekker, or **Decker, Jeremias de,** Dutch poet: b. Dort 1609 or 1610; d. Amsterdam 1666. His first published poetical work was 'The Lamentations of Jeremiah'; and several others which soon followed it were also translations. His 'Love of Gold,' a powerful satire, and his 'Goede Vrijdag,' or the 'Passion of Christ,' as well as his lyric poems, are still in high estimation; and his 'Epigrams' (Puntdichten) are, beyond dispute, the best of the kind which the literature of that period produced. The best edition of his poems, accompanied with a biography, was published by Brouerius van Nideck (1726).

Dekker, or **Decker, Thomas,** English dramatist: b. London about 1570; d. after 1637. He is first mentioned as a theatrical writer in 1597. He was one of the literary antagonists of Ben Jonson, who satirized Dekker in his 'Poetaster,' and the latter took his revenge in his 'Satiromastix.' He appears to have lived from hand to mouth, and been often in difficulties, imprisonments for debt being almost the only record, besides his works, that is left of him. Among his writings may be mentioned the 'Seven Deadly Sinnes of London,' a moral tract; the 'Double P P,' a violent tract against the Catholics; 'A Knight's Conjuring,' in which he introduces Chaucer, Spenser, and many other dead poets; 'The Gull's Hornbook,' valuable as a picture of the time. Besides his own plays he co-operated with Massinger in the 'Virgin Martyr,' and with Ford in the 'Sun's Darling,' a moral masque; the 'Pleasant Comedie of Old Fortunatus' (1600); and 'The Honest Whore' (1604); are among the most esteemed of his dramas. The number of Dekker's plays is about 28, of his tracts about 25.

De Ko'ven, Anna Farwell, American novelist: b. 19 Nov. 1860. She was graduated at Lake Forest University in 1880, and married to Louis Reginald De Koven (q.v.) May 1884. She is the author of 'A Sawdust Doll' (1894); 'An Iceland Fisherman,' a translation from Pierre Loti (1889); 'By the Waters of Babylon' (1901).

De Koven, Henry Louis Reginald, American composer: b. Middletown, Conn., 3 April 1859. He was graduated at Oxford in 1879 and studied music in the leading cities of Europe. His operettas have had great success, notably: 'The Begum'; 'Don Quixote'; 'Robin Hood'; 'The Fencing Master'; 'The Three Dragoons'; 'Maid Marian'; etc.

De Koven, James, American Episcopal clergyman and educator: b. Middletown, Conn., 19 Sept. 1831; d. Racine, Wis., 19 March 1879. He was educated at Columbia College and at the General Theological Seminary in New York. After his ordination to the priesthood in 1855, he took a pastoral charge at Delafield, Wis., and at the same time became principal of the preparatory school for Nashotah Seminary, founded two years earlier. In 1859 this became Racine College, and De Koven its first warden. He soon acquired a marked influence throughout the West, both in educational and ecclesiastical matters, in the latter taking up and carrying forward the teachings of the Oxford Movement. His most prominent appearance in this connection was in the General Convention of 1871, at a time when the ritual controversy ran very high. In bold and outspoken terms, which have become historical, he proclaimed and defended his position, with a marked effect on the legislation under discussion. When, however, in 1875, he was elected Bishop of Illinois, a considerable majority of the standing committees of the other dioceses refused to confirm his election, regarding his views as dangerous. He labored diligently for the upbuilding of Racine College, where he remained until his death. The published volume of his sermons (1880) contains a preface by Mr. Dix, which gives some idea of his commanding position in the church life of his time.

De Kroyft, dē kroift, **Susan Helen,** American author: b. Rochester, N. Y., 29 Oct. 1818. She was graduated at Lima College, New York, 1843, and married Dr. William De Kroyft, of Rochester, who was killed on his wedding day by a fall from a carriage. Mrs. De Kroyft shortly afterward lost her sight and has since then remained blind. Among her works are: 'Little Jakey' (1871); 'Darwin and Moses,' a lecture; 'A Place in Thy Memory' (1849); and 'Mortara.'

Del Credere, dĕl krĕd'ĕ-rĕ, an Italian mercantile phrase expressing a guarantee or warranty, given by factors, brokers, or mercantile agents, who, for an additional commission, become bound not only to transact business for their employers, but also to guarantee the solvency of the persons to whom the goods are sold, or with whom business is done. This additional commission is known as a del credere commission. The term has come into general use in international commerce, and is recognized in the common law system of England and America.

De la Beche, dē lä bāsh, SIR **Henry Thomas,** English geologist: b. near London 1796; d. there 13 April 1855. In 1817 he became a Fellow of the Geological Society, of which he was afterward made secretary, and eventually president in 1847. Among his works are a 'Manual of Geology' (1831); 'Researches in Theoretical Geology' (1834); and a 'Geological Observer' (1853). He was founder of the Geological Museum and of the School of Mines. In 1848 he received the honor of knighthood.

Delaborde, Henri François, ŏñ-rē fränswä dē lä-bôrd, COUNT, French general: b. Dijon 21 Dec. 1764; d. 3 Feb. 1833. He distinguished himself in the Republican armies; fought through the whole of the Napoleonic wars, and was ennobled in 1807.

Delacroix, Ferdinand Victor Eugène, fĕr-dē-năñ vĕk-tôr ē-zhān dē-lä-krwä, French painter: b. Charenton-St.-Maurice, near Paris,

26 April 1799; d. Paris 13 Aug. 1863. His first painting, 'Dante and Virgil in the Infernal Regions,' attracted much notice in the exhibition of 1822. This picture displayed a wide departure from the coloring and manner of the school of David, and accordingly it gave rise to enthusiastic praise on the one side; on the other to contemptuous depreciation, but everywhere to wonder. His 'Massacre in Scio' (1824) was a formal declaration of war against the school of the classicists, who named it a Massacre of Painting. These were followed by the 'Execution of the Doge Marino Falieri' (1826); the 'Death of Sardanapalus' (1827); and the 'Murder of the Bishop of Liège' (1830)— pieces painted with fire and vigor. His sympathy with the revolutionary party was shown by his celebrated picture of the 'Goddess of Liberty at the Barricades.' In 1831 he joined the embassy sent by Louis Philippe to the Emperor of Morocco. To this journey we are indebted for several pictures remarkable for their vivid realization of Oriental life as well as their masterly coloring. They are the 'Jewish Marriage'; 'Muley Abderrhaman With His Body-guard'; 'Algerian Ladies in Their Chamber'; 'Moorish Soldiers at Exercise'; and the several scenes of common life. In spite of his undoubted genius Delacroix failed in gaining popularity with the general public. He was commissioned not only with the decoration of public buildings, such as the Luxembourg Palace, the town-hall, and the Louvre, but large paintings were executed by him for the Parisian churches, and the historical museum of Versailles contains two of his masterpieces — the 'Battle of Taillebourg' (1838), and the 'Taking of Constantinople by the Crusaders' (1841). In 1857 the Academy elected him a member of their body. Delacroix was an artist of great versatility; mythology, legend, history, and poetry by turns furnished him with subjects, and in addition he painted portraits, allegorical and genre pictures, hunting scenes, etc.; but all exhibit at once his strength and his weakness — brilliant coloring and incorrect drawing.

Del'afield, Francis, American physician: b. New York 3 Aug. 1841. He was educated at Yale, and the New York College of Physicians and Surgeons, in which latter institution he has since been a professor of pathology and practice of medicine. He has published 'Handbook of Pathological Anatomy'; 'Handbook of Post Mortem Examinations and Morbid Anatomy'; 'Studies in Pathological Anatomy.'

Delafield, Richard, American military engineer: b. New York 1 Sept. 1798; d. Washington, D. C., 5 Nov. 1873. He graduated from West Point in 1818, and was draughtsman to the American boundary commission, appointed under the treaty of Ghent. In 1819–38 he was assistant engineer in the construction of Forts Monroe and Calhoun; had charge of the improvements on the Mississippi, and of the building of the Cumberland road and the construction of Fort Delaware. In 1838 he was appointed superintendent of the Military Academy at West Point, and held the position seven years at that time, and again from 1856 to 1861, when he was relieved at his own request. In 1855 he was senior member of a commission sent to the Crimea to report on modern methods of warfare; he prepared the report which was published by Congress in 1860. During the Civil War he assisted in organizing and equipping the New York troops and had charge of the construction of fortifications in New York harbor. In 1864 he was made chief of engineers, and retired in 1866 with the rank of major-general.

Delago'a Bay, a bay on the southeast coast of Africa, in Portuguese territory, partly enclosed by Inyack peninsula. It is about 70 miles long and 20 miles wide. Though crossed at its entrance by a shifting bar it is accessible to vessels of the largest class, and is the finest harbor on the east coast of Africa. Several large rivers flow into it. See PORTUGUESE POSSESSIONS IN AFRICA.

De la Hire, Philippe, fē-lēp dė là ēr, French mathematician: b. Paris 18 March 1640; d. there 21 April 1718. He was a member of the Academy of Sciences and professor at the College of France. His chief work was in pure mathematics, but he was also an astronomer. Many of his papers are in the Memoirs of the Academy of Sciences. Among his writings are 'Nouvelle Méthode de Géométrie'; 'Sectiones Conicæ'; 'Mémoire sur la Epicycloid' (1694); and 'Mémoire sur les Conchoids' (1708).

Delambre, Jean Baptiste Joseph, zhŏn bäp-tēst zhō-zĕf dė läñ-br, French astronomer: b. Amiens, France, 19 Sept. 1749; d. Paris 19 Aug. 1822. In 1790, eight years after the discovery of Uranus, Delambre published the tables of that planet, although in that period it had but performed a small part of its eighty years' course. He also constructed tables of Jupiter and Saturn, and of the satellites of Jupiter, which, with several treatises, procured him a reception into the National Institute. In 1802 Napoleon appointed him inspecteur-général des études, which post he resigned when chosen perpetual secretary of the class of mathematical sciences (1803). His first tables of the sun were published in 1792; in 1806 appeared his new ones. In 1807 he succeeded Lalande in the Collège de France, and wrote his 'Traité d'Astronomie théorique et pratique' (1814); 'Histoire de l'Astronomie du moyen âge' (1819); Histoire de l'Astronomie moderne' (1821); 'Histoire de l'Astronomie du 18me Siècle.'

Delamination. See EMBRYOLOGY.

De Lancey, Edward Floyd, American historical writer: b. Mamaroneck, N. Y., 23 Oct. 1821; d. Ossining, N. Y., 7 April 1905. He was author of 'Documentary History of New York' (1851); 'The Capture of Fort Washington the Result of Treason' (1877); 'Origin and History of Manors in the Province of New York' (1866).

De Lancey, William Heathcote, American Protestant Episcopal bishop: b. Westchester County, N. Y., 8 Oct. 1797; d. 1865. He was graduated at Yale College in 1817; studied theology and entered the Episcopal ministry in 1822. He was secretary of the house of bishops in the general convention of the Episcopal Church of the United States 1823–9. Upon the reorganization of the University of Pennsylvania in 1828, he was chosen provost of that institution, and remained provost five years. In 1839 he became bishop of the diocese of Western New York.

Deland, Ellen Douglas, American writer for young people: b. Lake Mahopac, N. Y., 3

Sept. 1860. She was educated in New York but until very recent years has lived mainly in Philadelphia. Her published books include 'Oakleigh' (1896); 'Malvern' (1896); 'In the Old Herrick House' (1897); 'A Successful Venture' (1897); 'Alan Ransford' (1898); 'Katrina' (1898); 'Three Girls of Hazelmere' (1903).

Deland, Margaret Wade Campbell, American novelist: b. Allegheny, Pa., 23 Feb. 1857. She was educated at the Cooper Union, New York, and for a time taught drawing. In 1880 she married L. F. Deland and has since lived in Boston. 'John Ward, Preacher' (1888), her first novel, attracted wide notice. Other works are 'The Old Garden and Other Verses' (1887); 'Sydney' (1890); 'Florida Days,' a collection of sketches of travel; 'The Story of a Child' (1892); 'Mr. Tommy Dove and Other Stories' (1893); 'Philip and His Wife' (1894); 'The Wisdom of Fools' (1897); 'Old Chester Tales' (1901); 'Good for the Soul.'

De Land, Fla., town, county-seat of Volusia County, on the Jacksonville, Tampa & Key West Railroad; about 55 miles southwest of Saint Augustine. It is a favorite health resort, noted for its sulphur springs. The John B. Stetson University, a Baptist institution, was established here in 1887. Pop. 1,510.

Delane, John Thaddeus, English journalist: b. London, 11 Oct. 1817; d. 22 Nov. 1879. After leaving Oxford he studied life in many forms, walked the hospitals, was called to the bar, and reported in the House of Commons. In May 1841 he became editor of the London *Times*. For 36 years Delane held this post. Under his editorship the *Times* attained a prodigious circulation, and an influence unparalleled in the history of journalism. He merged his personality in his paper, and the history of his later life is the history of the extraordinary influence wielded by the leading journal. He was singularly shrewd in weighing public opinion, possessed remarkable foresight, and seldom made a mistake. He resigned the editorship in 1877.

Del'ano, Columbus, American lawyer and politician: b. Shoreham, Vt., 5 June 1809; d. Mount Vernon, Ohio, 23 Oct. 1896. He studied law at Mount Vernon, was admitted to the bar in 1831, and shortly after elected prosecuting attorney of the county. He was elected member of Congress in 1844 and voted against the declaration of war in Mexico; he was again elected to Congress in 1864 and 1866. He was delegate to the Republican conventions of 1860 and 1864, and member of the State Legislature in 1863. In President Grant's first administration he was appointed commissioner of internal revenue, and reorganized the department, putting it on an excellent financial footing. In 1870 he became secretary of the interior, resigning in 1875, and retiring from public life. He was one of the trustees of Kenyon College and endowed its preparatory department.

Dela'ny, Mary Granville, English writer: b. Coulston, Wiltshire, 14 May 1700; d. Windsor 15 April 1788. She married first, in 1718, Alexander Pendarves (1659–1724); and secondly, in 1743, Swift's friend, the Rev. Patrick Delany (1685–1768). After his death she lived chiefly in London. Her much-admired "paper mosaics," or flower-work, have long since faded; but she is remembered through her patronage of Miss Burney, and by her 'Autobiography and Correspondence' (1861–2), with its gossip of the court and the literary society of her day.

Delaplanche, Eugène, French sculptor: b. Paris 1836; d. there 1891. He was a pupil of Duret, received the grand prize of Rome, 1864, and the medal of honor 1878. Among his works are: 'Child and Turtle'; 'Eve Before the Fall'; 'Saint Agnes'; 'Maternal Education'; 'Harmony'; 'Africa,' in bronze; 'Music'; 'Virgin of the Lilies,' in the Luxembourg; 'Aurora,' also in the Luxembourg; 'Circe'; The Dance'; and a statue of 'Auber' for the opera house. He is noted for grace and nobility of treatment and refinement of style.

De Lara, Isidore (COHEN), English composer: b. Dublin. He was a pupil of Muzzucato in Milan, and gained great popularity in England by singing his own compositions, especially drawing-room songs. His opera 'Moina' was given at Monte Carlo in 1891, and his 'Amy Robsart,' with libretto by Augustus Harris, was produced at Covent Garden, London, in July 1893, but the music was not notable. The music of his 'Messaline' has been deemed lacking in originality. The libretto was by Armand Silvestre and Eugene Morand. This opera was produced at Monte Carlo 21 Feb. 1899; in London 1899 and 1900, with Calvé in the leading part, and in New York in 1902 with Calvé and Alvarez.

De la Ramée, dẽ lä rä mā, **Louise.** See OUIDA.

De la Rey, Jacob Hendrick, Boer general: b. Lichtenburg District of the Western Transvaal 1849. He gained distinction in his first command against the Basutos, when very young, and served two years in the Volksraad, supporting Joubert. He commanded the Lichtenburg burghers at the outbreak of the Boer-British war, 1899–1902, which force served later in Cronje's western column. He distinguished himself at Magersfontein; in the retreat before Lord Roberts, and at Nooitgidachet 1900, where he captured 500 English troops. He captured Lord Methuen 7 March 1902 with many of his men, but released him on account of not being able to treat his wounds, lacking hospital facilities; an instance of his noted humaneness. He was very popular with the Boers and his military skill was greatly respected by his foes. He served on the Boer committee which arranged for peace, and, later, on the deputation visiting Europe and the United States to raise funds for the Boers that they might continue their occupations at home.

De la Rive, Auguste, Swiss physicist: b. Geneva 9 Oct. 1801; d. Marseilles 28 Nov. 1873. He received the appointment to the chair of natural philosophy in the Academy at Geneva at the age of 22. First devoting himself to the study of the specific heat of gases, and of the observation of the temperature of the earth's crust, he soon turned his complete attention to electricity, making original discoveries in connection with magnetism, electrodynamics, the relation between magnetism and electricity, and the properties of the voltaic arc, and presenting new theories upon the subject of the aurora borealis. He discovered the process of electro-gilding, for which he received the grand prize of 3,000 francs from

the Académie of Sciences 1842, becoming one of the eight foreign associates of the Académie in 1864. His chief work was a complete treatise on electricity in three volumes, which was translated into several languages, and was considered of the highest authority upon the subject.

Delaroche, Hippolyte, ē-pō-lēt dė-lä-rōsh, (familiarly styled PAUL), French painter: b. Paris 17 July 1797; d. there 4 Nov. 1856. He entered the studio of Baron Gros, and rapidly rose to eminence as one of the greatest of modern painters in France. His subjects are principally taken from French and English history. Among others may be mentioned, 'St. Vincent de Paul Preaching before Louis XIII. on Behalf of Deserted Children'; 'Joan of Arc Interrogated in Prison by Cardinal Beaufort'; 'Flora Macdonald Ministering to the Pretender after the Battle of Culloden'; the 'Death of Queen Elizabeth,' a work greatly admired by French and generally reprobated by English critics; 'A Scene of the St. Bartholomew Massacre'; 'The Children of Edward IV. in the Tower'; 'Cardinal Richelieu conducting Cinq Mars and De Thou up the Rhone to Execution'; 'Cromwell Contemplating the Dead Body of Charles I.,' one of Delaroche's most exalted efforts; the 'Execution of Lady Jane Grey,' and the 'Death of the Duke of Guise.' What he considered his *chef-d'œuvre,* was the pictorial decoration of the hemicycle of the Palais des Beaux Arts, on which he was engaged from 1837 to 1841. In this composition Delaroche has sought to illustrate the history of art from the remotest period to the present day, by representing, in one compartment, the great artists of all ages, painters, sculptors, and architects. Notwithstanding the number of persons depicted (upward of 80), and the diversities of figure and costume, the whole presents a group in perfect harmony, with a coloring at the same time quiet and rich, and a correctness of drawing which leaves nothing to be desired. It has often been objected to Delaroche that the accessories of his pictures are finished with such minuteness as to divert the attention from the main subject. His signal merits consist in correct drawing, brilliant and harmonious color, and great distinctness and perspicuity in treatment, rendering the story of his pictures at once intelligible.

De la Rue, Warren, English inventor and physicist: b. Island of Guernsey 18 Jan. 1815; d. London 22 April 1889. He was educated in Paris and followed his father's business, that of manufacturing paper wares. For this he invented many new processes and machines. He is best known for his application of photography to astronomy. He was a member of the International Electrical Congress at Paris in 1861, president of the Royal Astronomical Society, and held other posts of honor. His reports of original observations in chemistry, astronomy, and physics are of the greatest value.

Delaunay, Charles Eugène, shärl ė-zhān dė-lō-nā, French astronomer: b. Lusigny, Aube, 9 April 1816; d. Cherbourg 5 Aug. 1872. He studied at the Ecole Polytechnique, becoming a mining engineer. He taught mechanical engineering at the Polytechnique and on the Faculty of Sciences of Paris, and was made a member of the Institute in 1855. In 1870 he became director of the Paris Observatory. Among his works are: 'On a New Analytical Theory of the Movement of the Moon'; 'Theory of the Tides'; 'Slowing of the Rotation of the Earth'; 'The Seasons'; and a 'Report on the Progress of Astronomy' (1867).

Delaunay, Jules Elie, zhül ā-lē, French figure and portrait painter: b. Nantes 12 June 1828; d. Paris 5 Sept. 1891. He received the Grand Prix de Rome in 1856; the first-class medal at the Paris Exposition of 1878; and at that of 1889 was awarded the medal of honor. He was made an officer of the Legion of Honor and a member of the Institute. His portraits are considered masterpieces. His 'Diana' is in the Luxembourg Gallery, Paris, and the 'Death of the Centaur Nessus,' in the Museum at Nantes.

Delaunay, Louis Arsène, loo-e ăr-sān, French actor: b. Paris 21 March 1826; d. Versailles 22 Sept. 1903. He made his début in Oct. 1846, at the Odéon. In 1848 he acted at the Théâtre Français in the role of Durante, becoming secretary to the theatre in 1850. Till he retired (1887), he was one of the most accomplished actors on the French stage. He has found some of his greatest parts in the plays of Hugo, Pailleron, De Musset, and Augiers.

Delavan, Wis., a city of Walworth County near Delavan Lake, and on the Chicago, Milwaukee & St. Paul Railroad. It has some manufacturing interests, including dairies. It is the seat of the State institution for the education of the deaf; and on account of mineral springs in the vicinity and the lake is a place of summer resort and the site of a summer school. Pop. (1900) 2,244.

Delavigne, Jean François Casimir, zhŏń fräń-swà käz-ē-mēr dė-lä-vēn-yė, French poet and dramatist: b. Havre 4 April 1793; d. Montmorency 11 Dec. 1843. He was educated at the Lycée Napoléon, Paris, and in 1811 composed a dithyrambic on the birth of the King of Rome, which attracted considerable attention, and procured him, from Count François de Nantes, a situation in the office of indirect taxes. At the Restoration he published a set of elegies entitled 'The Messenians,' which deplored the faded glories of France. He produced in 1819 his tragedy of 'The Sicilian Vespers'; 'The Comedians' appeared in 1820, and the tragedy of 'The Paria' in 1821. Of his other plays which followed these may be mentioned: 'The School of Old Men'; 'Marino Faliero' (1829); 'Louis XI.,' founded on Commines' 'Memoirs'; 'Quentin Durward'; 'Don John of Austria.' His hymns, 'The Parisienne' and 'The Varsovienne,' and the ballad 'The Toilette of Constance' are among his more popular poetical pieces. He became in 1825 a member of the Academy.

Delaware ("the Diamond State"), the smallest but one and the least populous of the 13 original States; southernmost of the Middle States; 96 miles long by 9 to 37 broad, 2,050 square miles in area, 1,960 square miles of land. It is bounded east by the Atlantic, Delaware Bay, and Delaware River, the latter separating it from New Jersey; north by Pennsylvania, the boundary being a semicircle struck 12 miles from New Castle court-house; west and south by Maryland, arbitrary lines at a right angle. The broadest part is about 25 miles of the

extreme south, whence it narrows almost regularly to the north. Capital, Dover, near the centre. Pop. (1903) about 190,000.

Topography.— The whole peninsula between Chesapeake Bay and the Delaware River estuary and bay, divided between Maryland and Delaware, is part of the Atlantic coastal plain; flat, sandy, and with frequent swamps, of which there is one of about 70 square miles in southern Delaware. North of New Castle, where the Pennsylvania uplands sink down to it, there is a handsome rolling country; and behind Wilmington, the divide between Brandywine and Christiana creeks becomes a ridge rising to a hill 280 feet high, the most elevated ground in the State, with pleasing scenery along the streams. South of this, a marshy and sandy ridge nowhere over 70 feet high runs through the State northwest to southeast, forming the watershed between the bays, but following the line of the Atlantic coast about a dozen miles inland. In the southwest, therefore, the part of the State west of the ridge is bulky enough to create some fair-sized creeks, all feeding the Nanticoke in Maryland. The other streams are all petty brooks except in the extreme north, where Brandywine and Christiana creeks flow southeast from Pennsylvania, unite a half mile from the Delaware, and form a deep-water estuary which constitutes Wilmington harbor, which contributes to the greatness of the city. The only other good harbors on this marshy coast are at New Castle and Lewes, the latter protected by the Delaware breakwater at Cape Henlopen. On the southeast coast are two considerable but shallow lagoons called Rehoboth Bay and Indian River Bay, communicating at the outer edge, and separated from the sea by a sandspit pierced by Indian River Inlet, through which and on them vessels under six feet draft can navigate. Delaware Bay itself has 35 to 75 feet of water in mid-channel.

Natural Products.— The State has three geological divisions: Cretaceous in the north, succeeded southward by Tertiary and post-Tertiary, or Alluvial. The most valuable minerals, naturally, are found in the upper levels in the north. Near Wilmington are granite quarries which turn out over $600,000 of products a year; kaolin or porcelain clay beds, among the first worked in the United States, and which in 1900 produced 10,500 tons, valued at $91,500; and other clays for brick and terra-cotta. There is found also glass sand, feldspar, shell marl in the greensand districts, and bog-iron ore in all the swamps. The natural woods of the State are valuable, but most of them have been cut away (including the white-oak for shipbuilding once plentiful) except the forests of cypress, hackmatack, and other evergreen in the swamps. There is much shooting of wild ducks and teal, wild geese, etc., and some terrapin are caught.

Climate and Rainfall.— Delaware naturally has a range of temperature intermediate between the severe extremes of New England and the heat of the South; and still further tempered by the sea breezes which alternate with the southwest winds in summer. The northwest winds of winter and spring are probably not more severe than of old, but the delicate crops, like peaches, have furnished a more costly thermometer, and the precariousness of the spring warmth is felt. On an average, the spring begins about 1 April, and the autumn frosts toward the middle of October; the average temperatures run from about 85° in August to 25° in January. The rainfall is from 40 to 45 inches annually, the heaviest on the coast; and droughts never become ruinous. In the swampy districts and southern lowlands there is some malaria; but as a whole the State has a good sanitary record.

Soils and Agriculture.— The soil of the State steadily lightens southward from a heavy rich clay in the north, and for some miles inland along the Delaware River, to loamy clay and loam in the centre, and sand with some loam in the south. The north is the region of cereals and hay; the centre and south, of fruits, berries, grapes, and vegetables; and the south especially of peaches and strawberries. The State is one immense market garden and orchard for the North, especially the great cities not far away,— New York, Philadelphia, and Baltimore. New Jersey, Maryland, and Delaware raise three fourths of all the peaches, berries, and small fruits sold in these markets. Delaware in the popular mind is identified with the peach crop, which in good years has yielded 4,000,000 baskets or crates; but a considerable percentage of the trees have been injured and the crops frequently blasted by the late spring frosts in recent years, and there is a growing tendency to replace entire reliance on this precarious crop by market gardening and even cereals. Still, the railroad freightages in the summer of 1902 were estimated at 2,351,460 baskets, besides 362,345 baskets of pears. The other orchard fruits together exceed the peaches; the apple crop especially is very large. Of the market gardening, the tomato is by far the principal crop, and is exceeded only by that of Maryland and Indiana; 16,000 acres were planted in 1902, and 750,670 cases sent out, of 24 cans each, or 18,160,000 cans. A surprising development, however, in which it is alone among the eastern States, has been in the wheat crop for the past two decades: its acreage in 1900 was 118,740, or nearly one sixth of all the improved land, against 87,530 in 1880. In 1902 it raised 1,792,006 bushels. The first place in acreage, however, belongs to corn, 187,134 in 1902, or about one fourth of all; the yield was 5,239,732 bushels. Third was hay, 76,373 acres, 83,247 tons. There were also 6,000 acres of potatoes, with a yield of 471,000 bushels, or 78.5 bushels to the acre, against 48 in 1900. The dairy interest has enormously increased in the decade: in 1900 there were 21 creameries and one cheese factory, against five creameries in 1890; the capital had increased from $19,085 to $88,155, and the value of products from $124,780 to $252,890.

Outside of its one great manufacturing city, the agricultural interest is supreme; no other State compares with it in the proportion of land under cultivation. Of the total land surface of 1,254,000 acres, 1,066,228 was in farms in 1900, and 754,010 were improved, or 60 per cent of the whole soil. Less than half the farmers own their own farms, and nearly the same number work on shares. The thin soil of the south — which reduces the average value of farms from $45 in the north to $12 — has also made heavy use of fertilizers necessary. Stock farming is not much practised, save milch cows.

Manufactures.— While Delaware as a State is predominantly agricultural, the enormous relative magnitude of its one great city, Wilming-

ton (containing two fifths of its entire population), and the industries concentrated around it, makes the northern end a very important manufacturing section. The great natural advantages of the spot were early utilized; the deep harbor for building the largest ships, the 100-foot falls of the Brandywine four miles from its mouth, and the proximity to the great coal and iron fields of Pennsylvania, Maryland, and Virginia. All branches of iron and steel manufacturing are carried on to an immense extent. The first iron sailing vessel in the country was built in 1854 in Wilmington, which had previously been noted for building wooden ships; and up to 1900 that city had built over 400 iron and steel steamers, more and of greater aggregate tonnage than any other single port in the United States. The two companies there built 13 such vessels in 1900. Pumping and mining apparatus and paper-making machinery are famous specialties; in 1817 the first endless-sheet paper machine was set up in Wilmington, revolutionizing the business. Its manufactories of steam and street cars, machine tools, engines, boilers, etc., are known all over the globe. Next to iron and steel comes the dressing and manufacture of leather, in which Delaware stood sixth of the United States in 1900, against ninth in 1890. Wilmington has one of the largest morocco plants in the world. The flouring-mill industry comes next, but is slightly falling off, as this business tends to go West; then the manufacture of fertilizers; and next the canning business; both of which are increasing immensely, and more than doubled in the decade. There is a considerable textile manufacture, but not as much as formerly. The most interesting concern is the great powder works of the Du Ponts on the Brandywine, a few miles from Wilmington, the oldest and largest of the kind in the country. The company was founded by the French exile, Du Pont de Nemours, in 1802, and till 1902 remained a family preserve; in that year it was turned into the E. J. Du Pont de Nemours Company, with a capital of $20,000,000. There is a petroleum refinery at Marcus Hook.

Fisheries.— The oyster, shad, and sturgeon fisheries of the State are of considerable magnitude, the whole fish catch being worth some $250,000 a year and employing about 2,500 men.

Commerce and Transportation.— The Delaware district reports over $750,000 a year of exports and imports, and clears about 250 vessels. Wilmington, Lewes, and New Castle are ports of entry, and the former is a customs district. It has some direct foreign commerce, a steamer line to New York, and coasting lines to Philadelphia and down the bay; besides communication with Baltimore by the Delaware & Chesapeake Canal (see CANALS), 13½ miles long, 66 feet wide, and 10 feet deep, completed in 1829. The great Delaware Breakwater opposite Lewes was begun the year before, and completed 1869; it cost over $2,000,000, and forms an artificial harbor some 300 acres in extent, with 24 feet of water. (See DELAWARE BREAKWATER.) Railroad facilities are excellent; there are about 360 miles of main track in the State. The one great line, which serves nearly all the State, is the Philadelphia, Baltimore & Washington, whose main line runs through it lengthwise from Wilmington to Delmar at the southern boundary, where it connects with another to Cape Charles and Norfolk; its Delaware, Maryland & Virginia branch in the southeast serves that portion. Other branches run from it. In the north, the Baltimore & Ohio, and the Philadelphia, Wilmington & Baltimore division of the Pennsylvania system, parallel each other through Wilmington and the line to Philadelphia and Baltimore. Queen Anne's Railroad runs across the centre to Chesapeake Bay.

Banks, etc.— There are 20 national banks in Delaware, with a capital of some $2,250,000, and deposits of about $7,000,000; reserve, about $2,500,000. There are also two State banks, with $600,000 capital, deposits of $1,750,000, and resources of $3,000,000; and two mutual savings banks, with deposits of over $5,000,000. In these regions, however, the building and loan association takes largely the place of the northern savings bank. There are several local fire and mutual life-insurance societies.

Churches.— The strongest religious denomination is the Methodist Episcopal; next in order of size are the Presbyterian, Protestant Episcopal, Baptist, Roman Catholic, Quakers, and Lutherans; and there are several smaller ones. There are about 1,200 church organizations, and an enrolment of toward 50,000 members. Wilmington is the seat of the Roman Catholic diocese of that name, embracing Delaware and part of the southern peninsula, and of the Protestant Episcopal diocese of Delaware.

Charities and Penal Institutions.— There is a State Insane Hospital, with about 350 inmates. There being no State institutions for the feeble-minded, deaf-mutes, or the blind, the statutes permit five of the last two classes from each county, and 14 imbecile children from the State, to be maintained at institutions of other States; and they are so kept at Philadelphia and Washington. The Ferris Industrial School for Boys at Wilmington has about 75 inmates. There is a public workhouse in Newcastle County, with indeterminate sentence. The whipping-post is a punishment for minor offenses.

Education.— The public schools are supported by local taxes; by a State distribution of the income of a fund now some $580,000, and of the proceeds of certain taxes, both yielding about $140,000 a year, devoted entirely to paying teachers' salaries and furnishing free text-books; and by an annual appropriation beyond this, fixed by the constitution at a minimum of $100,000. The teachers number about 640 females and 210 males; the salaries of the former averaging about $34 a month and of the latter $36.60. The school year is longer and schools much more developed in the Wilmington district than elsewhere; and this manufacturing section has been prevented from greatly improving the system by its under-representation in the State government, due to an unfair apportionment. Of about 50,000 children in the State, between 5 and 18, something over half attend school for six months and more, and about 4,000 others for shorter periods; it is notable that the attendance of foreign-born children, and native-born of foreign parents, is much higher than that of the pure natives, owing to the former being concentrated in Wilmington, where the schools are best. There are separate schools for the colored population, and a State agricultural college for them at Dover, which graduates three or four annually. There are 14 academies, seminaries, and high schools; and one college, Delaware College at Newark (coeducational), with scientific

and normal departments. It had 114 students in 1902. Otherwise there is no normal school; but there are teachers' institutes in each county. There is a State Board of Education, and in each county a school commission and a superintendent of public instruction.

Government.— The present constitution is of 1897; following the now usual Southern practice, it was not submitted to the people. The registration and educational provisions for the franchise enable the exclusion of all whom the governing classes think unfit. The legislature has a senate elected for four years and a house for two. The senate has seven members from Newcastle County (Wilmington, etc.), and five from each of the other two; the house has 15 members from Newcastle and 10 from each of the others. Sessions are biennial. Provisions for revenue and impeachment are the same as in the national Constitution. The members are paid $6 a day up to 60 days, after which they sit at their own expense; special sessions are thus limited to 30 days. The State officers are chosen for four years. The governor has a veto by items; his pardoning power is on recommendation of a board of pardons. The judiciary is composed of a supreme and superior court, a court of chancery, orphans' court, court of oyer and terminer, and registers' court; there are six judges,— a chancellor and five "law judges," of whom one is chief justice. They are appointed by the governor for 12 years, with the concurrence of the Senate.

The State has one representative in Congress, and therefore three members of the Electoral College, chosen by popular election.

There is a National Guard of 321 privates and 51 officers.

Finances.— Delaware's bonded debt in 1902 was $769,750, mostly incurred in 1887 and 1897. The assets were $1,118,509.16, over $1,000,000 invested. The State expenditures were $341,000. There are no State taxes on individuals; the receipts are from fees and licenses, inheritance tax, special tax on banks and railroads, etc. The assessed valuation of the State is about $76,000,000.

Divisions and Population.— The State has three counties: Newcastle, Kent, and Sussex. The former, containing Wilmington, has three fifths the entire population of the State. The counties are divided into "hundreds" instead of townships, the towns being included in the hundreds. There are 35 incorporated cities and towns, of which Wilmington is the only large one; it had 76,508 in 1900, and has about 80,000 now. Of the others, the chief are New Castle, 3,380, a decrease from 4,010 in 1890; Dover, the capital, 3,329, slightly growing; Milford, 2,500; Lewes, 2,259; Smyrna, 2,168.

The population from the first census to the last is as follows: 1790, 59,094; 1800, 64,273; 1810, 72,674; 1820, 72,749; 1830, 76,748; 1840, 78,085; 1850, 91,532; 1860, 112,216; 1870, 125,015; 1880, 146,608; 1890, 168,493; 1900, 184,735. Of these, the males were 3,581 in excess. The colored were 30,758, or almost one sixth. The foreign-born numbered 13,810; the native-born of foreign parentage, 22,219. In Indian River hundred, Sussex County, there is a considerable body of "white Indians" or "Moors," traditionally descended from a band of shipwrecked Moorish sailors. They do not associate with the colored race, and maintain separate schools and churches with the help of the State.

History.— Delaware represents the sole attempt of Sweden to seize its share of America. It does not take its name from the Indians who inhabited it, but from the river and bay, named by the English after Lord de la Warr, who explored it in 1610; the Dutch called the river "South River," as distinguished from the "North River," the Hudson. The first settlement actually made in Delaware was by the Dutch trader, De Vries, in 1631, at Paradise Point, the present Lewes; he called it Hoornkill, from his Dutch home, but the English corrupted it to Whorekill, and invented a story to account for the name — as usual. The agent he left there fell out with the Indians, who slaughtered the whole settlement and burnt the manor house. In 1637 Axel Oxenstiern, the great Swedish minister of Gustavus Adolphus, revived his dead master's plan of founding a Swedish West India Company, and sent Peter Minuit, the ex-director-general of New Netherlands, with a mixed Swedish and Dutch expedition to seize and settle a point on the coast. Minuit landed April 1638, and fixed on the peninsula, where Wilmington now stands, about two miles back from the Delaware; he called the creek "the Elbe," and built a fort which he called Christina, after the girl-queen of Sweden, Gustavus' daughter. The creek later was given that name, now corrupted to Christiana, locally and more correctly Christeen. The entire domain he called New Sweden. The Dutch protested, but as their company had to pay its own war bills, they did no more; and in 1640 the Swedish government sent another body of colonists. More Dutch came also and settled some miles below; the stockholders of the enterprise were part in Holland and part in Sweden, and each party sent its own countrymen. The Swedish settlements were vigorous and spread rapidly, colonizing New Gottenburg at Tinicum Island and Upland near by, driving a New Haven English colony off Salem Creek in New Jersey and keeping the place themselves, with a fort called Elsenburg. In 1646 the Dutch built a block-house on the site of Philadelphia, opposite Fort Nassau built by them in 1623; the Swedish governor, Printz, marched there and pulled it down. But when Stuyvesant came to New Netherlands in 1647, he was under orders to fight; and in 1651 he built Fort Casimir on the site of New Castle, blocking the Delaware to the Swedes. Rising, Printz's successor, attacked and captured it in 1654, and changed its name to Trinity. Stuyvesant came down in 1655 with a large force, captured not only Trinity, but Christina, deported the officers to New Amsterdam, and forced the rest to swear allegiance to the Netherlands or leave the country. Trinity was renamed New Amstel. The Swedish dominion was ended; but its blood remained, and the tradition of alien independence in the mixed colonial strain made it utterly unassimilable, and has created the present State. The Dutch divided it into the historic three counties.

When the Duke of York took New Amsterdam from the Dutch in 1664, the Delaware settlements went with it, and New Amstel was renamed New Castle. When the Dutch retook New York in 1673, there was a renewed Dutch rule on the Delaware. In 1682 (24 August), William Penn, to give his new colony control of

the mouth of the Delaware, bought the lower settlements; it then contained about 6,000 Swedes, English, Dutch, and mixed breeds, who had always been governed by themselves or by a deputy from New York. He also bought a lingering boundary dispute with the Baltimores, not settled till 1768. The lower river settlements were at first governed as part of Pennsylvania, being called the "Three Lower Counties on the Delaware," and sending six representatives apiece to its legislature; but there was no community of interest and a violent discontinuity of feeling, and the lower counties insisted on a separate legislature. They obtained it in 1703, with a separate council in 1710, and kept it till the Revolution, the sessions being held at New Castle. The same governor was appointed for both, however. In the Continental Congresses the colony was separately represented, as "The Counties of New Castle, Kent, and Sussex, upon Delaware"; and on 21 Sept. 1776 it proclaimed a State constitution as "The Delaware State." For some years, however, it chose the same governor as Pennsylvania. It was the first (7 Dec. 1787) to ratify the national Constitution. In 1792 it adopted a new constitution and the name of "The State of Delaware"; in 1831 a third, and in 1897 the present one.

Delaware's naturally divided position as a slave-holding border State has been sharply accentuated by the natural antagonism between its agricultural and manufacturing sections. The northern part, an outcrop of the Pennsylvania manufacturing interests, has shared the Northern sympathies; the southern has always been Southern in feeling, and sent numbers of soldiers to the Confederate side in the Civil War. But the large preponderance of population in the north, though hampered by an unjust system of representation, made itself vigorously felt in the War; the legislature promptly voted "unqualified disapproval" of the proposal to secede; it answered the calls for Union troops so quickly and fully that Lincoln said in his message of 3 Dec. 1861, "Noble little Delaware led off right from the first"; and out of its 40,000 males from 14 to 60, it sent nearly 14,000 men to the Union armies, or over one third. When Reconstruction began, however, the legislative majority sympathized with their class, and denounced the Fourteenth Amendment, which the new constitution virtually abrogates. The leading element in the State politics since 1850 has been the "peace Democrats," devoted to the Union, but opposed to coercion of the States; as exemplified in the Bayard family (see BAYARD, JAMES A., 2D, and THOMAS F.). The Democratic majority, however, has been always small, except in 1878, when the Republican party was temporarily ruined by joining the Greenback-Labor movement. This balance has formed the basis of the effort for some years to win over Democrats enough to send John E. Addicks to the Senate (see ADDICKS, JOHN E., for a full description of the details), which has resulted in depriving Delaware of one senator for some years and of both latterly.

The people of Delaware are familiarly termed "The Blue Hen's Chickens," from their Revolutionary flag. As such, they were among the finest regulars in the Continental army.

Delaware, Ohio, city, county-seat of Delaware County; on the Whetstone (Olentangy) River, and on branches of the Cleveland, C. C. & St. L., the Pennsylvania, and several other railroads; 24 miles north of Columbus. It is the trade centre of Delaware and surrounding counties, and has manufactures of iron, flour, woolen, lumber, furniture, agricultural implements, etc. It is the seat of Ohio Wesleyan University, and the Ohio Wesleyan Female College. There are sulphur, magnesia, and other mineral springs nearby, and the city has large railroad repair shops, hotels, daily and weekly newspapers, and two national banks. Pop. (1900) 7,940.

Delaware Bay, a large bay or arm of the sea, between the States of Delaware and New Jersey. The Delaware River and several small streams flow into this bay. It is 65 miles long, and in the centre about 30 miles across, and about 15 at its mouth, from Cape Henlopen to Cape May. At the entrance to this bay, near Cape Henlopen, is situated the Delaware Breakwater, the object of which is to afford vessels a shelter within the cape. The breakwater proper is 1,200 yards in length, and runs in a straight line from east-southeast to west-northwest, leaving an entrance 650 yards wide between its east end and the north point of the cape. It serves also as an ice-break against the floating ice which sometimes comes down the bay. At the distance of 350 yards from the upper or western end of the breakwater a similar dike, of 500 yards in length, is projected so as to form an angle of 146° 15′ with the breakwater. Government lighthouses are stationed at the entrance, to indicate shoal places in the channel and breakers along the shore.

Delaware College, an institution founded at Newark, Del., 1833, closed in 1859. In 1870 it was reopened as a "Land Grant College"; the State of Delaware appropriating funds received under the Land Grant Act of 1862. Further aid received from the State funds obtained under the congressional act called the "Hatch Bill," enabled the college to open an experiment station in 1887. A still further grant was received under the act of 1890. The library contains (1903) about 14,000 volumes; the number of students enrolled in 1902, 75.

Delaware Indians (their own name Renno Renappi, or Lenno Lenape, "men": cf. Illinois, Innuit, Lokono, Muysca, Alemanni, etc.), an important Algonquin tribe which lay in the path of white settlement on both sides of the Delaware River, and therefore fills a large place in colonial history. Previously they had been subjugated by the Iroquois, who, instead of exterminating or absorbing them, exacted tribute, called them "women," and dictated their action. The early Dutch settlers were massacred as usual; but the Swedes on the Delaware upheld Indian titles to land to secure their own possession against the Dutch, compelling the latter in turn to buy instead of seizing, so there was peace with the Delawares in this period. The Swedes tried to Christianize them with Luther's catechism, without much success. In October 1682 Penn made his famous treaty with them, as well and as ill kept by his successors as others of the kind; that the Delawares did not revenge the white encroachments by massacre was due to Penn's sagacity in buying up their overlords, the Iroquois, who threatened to destroy them if they molested "Onas'" people. The infamous trick

of the "Walking Purchase" (q.v.) in 1737 (denounced by the Quakers) ousted them from half a million acres in the forks of the Delaware above Easton, and the Iroquois with furious menaces compelled them to retire to the Susquehanna. Here settlement pursued them, and not daring to resent it, a large part of them by 1750 had removed to the Alleghany and Muskingum, where they recovered Indian courage and ferocity. The Moravian missionaries converted part of the remainder, and these always remained peaceful. The others, maddened by aggression, joined the French and Iroquois in the French and Indian war, and helped in Braddock's defeat; sullenly yielding in 1758, after the Senecas had turned against them, they broke out again in Pontiac's Conspiracy (q.v.) of 1762, and were among the besiegers of Detroit, Fort Pitt, Duquesne, etc. Defeated by Bouquet at Bushy Run, 1763, they made peace in 1764–5. In 1768 all the remnants east of the Alleghanies migrated west; and the Christian Delawares founded the village of Gnadenhütten on the Muskingum. Roving bands of the others kept the field till the crushing defeat of Point Pleasant (q.v.), 1774. In the Revolution they were divided; part went with the English, part made a treaty with Congress in 1778. The Christians remained quietly at Gnadenhütten, till in 1781 the English broke it up and removed them to Sandusky. Part of them returned thither to save their crops, and were attacked by the Americans and 90 of them murdered; the rest fled mostly to Canada. Land was given them on the Thames, and they founded Fairfield, with others who came in 1787 from the Muskingum, where Congress had settled them. The wild tribesmen remained hostile, and contributed to St. Clair's defeat in 1791; but Wayne's victory forced them to make peace in 1795. Successive treaties removed them from Ohio, and by 1800 the main body were on White River, Indiana. They did not join Tecumseh in the War of 1812, and in 1818 they ceded all their lands each of the Mississippi and moved to White River, Missouri. There were then 1,800 in all, a few remaining in Ohio. Later, some went south to Red River, on the Texan border, by Spanish permission. By treaty of 24 Oct. 1829 the main body, about 1,000, settled on the Kansas and Missouri. They had schools and missions. In 1853 they sold all but a reservation in Kansas, invested the money sagaciously, and built fair houses, improved their farms, etc. During the Civil War, out of 201 warriors they sent 170 to the Union side, who proved good soldiers and guides. In 1866 their land was cut up by the Union Pacific Railroad, and they sold the whole in 1867–8, and took up lands on the Verdigris and Cane, bought from the Cherokees. A special treaty of 1866 permitted them to take lands in severalty and become citizens, they did so, and are not a "tribe" any longer, though they form a part of the "Cherokee Nation" in Indian Territory, numbering now 780. There are other bands, which in all make more than 780. They had three clans, the Turtle, Turkey, and Wolf or Munsee (q.v.); the latter, differing strongly from the rest, is in three divisions,— 120 on the Thames in Canada, about 200 at Green Bay, Wis., with the Stockbridges, and some 50 with the Chippewa in Kansas. There are also 95 on the late Wichita reserve in Oklahoma, 135 on Grand River reserve in Ontario, and 350 Moravians on the Thames.

Delaware & Hudson Railroad. The Delaware & Hudson Railroad system is the outcome of a series of amalgamations of many small lines leased and constructed from time to time by the Delaware & Hudson Canal Company, which was chartered under the laws of the State of New York in 1823 as a coal mining and transportation corporation. The State also loaned its credit of $500,000 to aid in the construction of a canal from Honesdale, Pa., across the Delaware River to the Hudson River, which was completed in 1828, hence the name "Delaware and Hudson." The canal was built to move boats carrying 25 tons. It was enlarged in 1844 for 40-ton boats and again in 1862 for boats of 125 to 150 tons capacity, and was finally abandoned in 1899.

The first steam locomotive ever placed on a railroad in the western hemisphere, "The Stourbridge Lion," made its trial trip on the Delaware & Hudson Railroad between Carbondale and Seeleyville, on 8 Aug. 1829. The locomotive was built by Foster Roswick & Company, of Stourbridge, England. It arrived in New York in May, 1829. It was of the grasshopper type with walking beams and vertical cylinders. The locomotive and the tender were each four-wheeled, with spokes and felloes of wood, iron tires and wheel centres. The track on which it ran was of strap iron spiked next the inner edge to large hemlock sleepers laid on cross ties.

The product of the Delaware & Hudson anthracite mines was 7,000 tons in 1829, 5,332,668 tons in 1904. In 1905 the Company operated 843 miles of railroad, employed about 18,000 men in its coal department, 9,000 in the railroad department, and 1,000 in its iron-mining department. The rail lines extend from Binghamton, N. Y., and Wilkes-Barre, Pa., to Rouses Point, N. Y., on the Canadian border, to Lake Placid, N. Y., and to Rutland, Vt., with many branch lines. The steamboat lines on Lake Champlain and Lake George, the Albany and Troy Traction lines, and the extensive iron mines and furnaces at and near Lyon Mountain, in the Adirondacks, are subsidiary Delaware & Hudson interests. The Company has also acquired the Quebec Southern Railway and will soon have an unbroken line from Wilkes-Barre, Pa., to the City of Quebec.

In the number and variety of its summer resorts, the Company holds a unique position. Among the important resorts on its lines are Cooperstown, Sharon Springs, Round Lake, Saratoga Springs, Lake George, Au Sable Chasm, Lake Champlain, and the mountain attractions of the Adirondacks.

Its earnings from passenger traffic are about $3,000,000 per annum, from freight about $12,000,000, and from coal about $20,000,000. The authorized capitalization of the Company is $55,000,000. Dividend payments are seven per cent.

The Company's position in the railroad family has been exempt from community of interest, domination, or influence by any of its railway neighbors or competitors through stock ownership, its untrammeled position in this respect leaving it free to develop its resources without interference.

J. W. Burdick,
Passenger and Traffic Manager.

Delaware, Lackawanna & Western Railroad Company, The, is a consolidation of a number of short railroads originally separate corporations, most of which were acquired by lease or purchase at different times and under various conditions.

The present D., L. & W. R. R. system comprises 2,304½ miles of line. It extends from the seaboard at New York to the Great Lakes at Buffalo, through New Jersey, Pennsylvania, Southern and Western New York, with branches into the slate and cement regions of Pennsylvania and New Jersey, and anthracite coal fields of Pennsylvania, and the agricultural, dairy and industrial area of Central New York. It carries on its rolls 19,977 employees, exclusive of those employed in the Company's coal department. The oldest portion of the present system was originally named the Ithaca & Owego Railroad, now known as the Ithaca Branch. The charter of this road was dated 28 Jan. 1828; the capital stock was $150,000. In 1832 the north end of the road was completed and the capital stock increased to $300,000. The length of road was 29 miles. Stationary engine and horse power was first used, the Company having no locomotives. The track was standard gauge, having a strap rail 2¼ inches by ⅝ of an inch. The first 13 miles of the road were open 13 Feb. 1834, and on 1 April 1834, the road was completed. The first locomotive was placed in operation on this road in the spring of 1840.

Financial revolutions of that period resulted in the foreclosure of a mortgage of $300,000 held by the state of New York for moneys advanced the Company, and the road was sold at public sale in Albany 20 May 1842 for $18,000. It was reorganized 13 April 1843 as the Cayuga & Susquehanna Railroad Company. On 21 April 1855, it was leased in perpetuity to the D., L. & W. R. R. Co.

The Morris & Essex Railroad, also part of the present D., L. & W. R. R. system, was projected in the early part of 1835, the purpose being to construct a railroad from Morristown, N. J., to some point in Essex County, contiguous to the tide water near New York harbor. The railroad was chartered 29 Jan. 1835, and the Company commenced running their cars by horse power from Newark to Orange 19 Nov. 1836; from Newark to Madison by steam power on Monday, 2 Oct. 1837, and from Newark to Morristown on 1 Jan. 1838. The average daily receipts from Newark to Morristown for passengers from 1 Jan. to 1 May, 1838, was $72. The road was completed to Dover 1 Aug. 1848; to Hackettstown, N. J., 16 Jan. 1854, and Phillipsburg, N. J., in 1867.

The Newark and Bloomfield Railroad running from Newark, N. J., to Bloomfield, N. J., now known as the Montclair branch of the D., L. & W. R. R. Co., was opened 1 July 1856, having been chartered 6 March 1852. This road was leased to the Morris & Essex Railroad.

The New Jersey Legislature seems to have passed an act in 1857 granting a permit to the M. & E. R. R. to build a line from Hoboken to Newark and to make such arrangements with the Hoboken Land and Improvement Company and the New Jersey Railroad Transportation Company as might be approved for running trains between Newark and Hoboken. Local trains were run between East Newark Junction and Hoboken Ferry until 1863, when the M. & E. R. R. trains commenced running to Hoboken over the Passaic River Bridge, purchased from the New Jersey Railroad & Transportation Company, thus reaching tide water at its own terminal. In order to avoid the steep grades of the original line, the M. & E. R. R. Co. obtained on 23 March 1865, permission to build from a point at or near Denville, N. J., connecting with its main line thence by way of Boonton, N. J., connecting with the Newark & Bloomfield Railroad. The M. & E. R. R. was leased to the D., L. & W. R. R. Co. on 10 Dec. 1868, the lease being ratified by the Legislature on or about 9 Feb. 1869, the road then becoming the Morris & Essex division.

The Sussex Railroad of New Jersey, another of the subsidiary companies of the present D., L. & W. R. R., was chartered 5 Feb. 1853, and was open for business 11 Dec. 1854. It joined the M. & E. Railroad at Waterloo, N. J., soon after the extension to Hackettstown, N. J., was built. Since August, 1881, the Sussex Railroad of New Jersey has been operated by the D., L. & W. Railroad, the junction now being made at Netcong, N. J.

The Chester Railroad, which joins the Morris & Essex division near Port Oram, N. J., was chartered in 1868 and opened in 1872. The Passaic & Delaware Railroad, now running from Summit, N. J., to Gladstone, N. J., was organized 9 Oct. 1878, and was leased 1 Nov. 1882, by the D., L. & W. R. R., the road then running from Summit to Bernardsville, N. J., In 1890 the road was extended to Gladstone, N. J.

The original main line of the present D., L. & W. system was first known as the Leggett's Gap Railroad, taking its name from a gap about two miles below Scranton. Its route lay from Scranton, Pa., to the Susquehanna River at Great Bend (near Binghamton, N. Y.), 53½ miles, there connecting with the then New York & Erie Railroad. The charter was obtained 14 March 1849. A supplement to this charter was approved 14 April 1851, by which the corporate name of the railroad became the Lackawanna & Western Railroad Company. The road was opened and the first train run about 15 Oct. 1851. The road was open for regular traffic on Monday, 20 Oct. 1851. By a purchase of the charter of the Delaware & Cobb's Gap Company, which latter was incorporated 7 April, 1849, but which never began the work of construction, the Lackawanna & Western Railroad Company became the Delaware, Lackawanna & Western Railroad Company, and the act of the Legislature for this consolidation was approved 11 March 1853.

The company owned valuable anthracite coal lands in Pennsylvania, but the use of this coal was not well understood by the public and the company concentrated its energies to develop this important part of its trade. Public interest in anthracite coal fuel was aroused by advertising and by distributing free samples. Carloads of coal were given away in order to induce parties to give it a trial. In order to get its coal to tide water the company finally decided to connect with the Warren Railroad of New Jersey. The latter was chartered 12 Feb.

1851, for a line 18.8 miles from the Delaware River at Sprague ville, Pa., to Hampton Junction, N. J., where connection was made with the Central Railroad of New Jersey to New York. The Warren Railroad was known as the Southern Division of the Lackawanna. It was opened for traffic on 27 May, 1856. When the D., L. & W. R. R. became amalgamated with the Morris & Essex Railroad, Washington, N. J., was made the transfer point to the Morris & Essex division and trains proceeded via that route to Hoboken. The D., L. & W. R. R. used the Bergen tunnel of the Erie Railroad until 1876, at which time the D., L. & W. completed its own tunnel through the Bergen Hill.

The Oswego & Syracuse Railroad was chartered 29 April 1839. The road was opened 14 May 1848. Traffic was commenced the end of October of that year. This railroad was leased to the D., L. & W. R. R. Co. 13 Feb. 1869.

The Syracuse & Binghamton Railroad was chartered 13 Aug. 1851, and was opened 18 Oct. 1854. It was reorganized with the title of the Syracuse, Binghamton & New York Railroad, 30 April 1857. A contract was then made with the D., L. & W. R. R., under which the road was operated, and in 1869 the D., L. & W. R. R. obtained control of the line by purchasing the major portion of its stock, thus completing the branch from Binghamton, N. Y., to Oswego, N. Y.

The Utica, Chenango & Susquehanna Railroad was organized 11 Jan. 1866, and was opened 10 Oct. 1872, before which date the Greene Railroad, a short connecting line, organized 18 Oct. 1869, was opened in 1871. These two railroads, together with the Richfield Springs branch, now form the Utica Division of the D., L. & W. R. R., having been leased on 9 April and 26 April 1870.

The Valley Railroad, beginning near Great Bend, Pa., and thence to Binghamton, N. Y., was organized 4 March 1869, and opened in 1870. It was leased 15 April 1869, to the D., L. & W. R. R. and added a short link between Great Bend and Binghamton.

The New York, Lackawanna & Western Railroad Company was chartered 26 Aug. 1880, to build a road from Binghamton to Buffalo, and on 17 Sept. 1882, the road was opened for traffic. On 2 Oct. 1882, it was leased in perpetuity to the D., L. & W. R. R. Co. The main line was thus completed from Hoboken to Buffalo.

The D., L. & W. R. R. assumed control of the Bangor & Portland Railroad 1 Aug. 1900, by purchase of its capital stock. It likewise assumed control of the Erie & Central New York Railroad, running from Cortland to Cincinnatus, N. Y., 1 Dec. 1903, by purchase of its capital stock and bonds, and of the Hoboken Ferry Company, operating a fleet of passenger ferry boats between Hoboken and New York, 1 May 1903, by purchase of its capital stock.

The last annual report of the company shows that during the year ending 31 Dec. 1904, the total number of passengers carried were 17,946,686, while the miles run by passenger trains were 5,414,862. In merchandise the number of tons transported were 7,296,679, while the amount of coal transported represented a total of 8,615,798 tons. During the year 6,510,621 miles were run by freight trains and the average earnings per train mile were $3.31. The gross earnings were $65,833,494.72. while the net income of the company was $6,773,870.72.

Delaware River, in the eastern part of the United States, has its rise in the Catskill Mountains in New York. It forms the boundary line for a short distance between New York and Pennsylvania, is on the whole length of the boundary line between Pennsylvania and New Jersey, and flows into Delaware Bay about five miles below Newcastle. Its most important tributaries are the Schuylkill and the Lehigh. The whole length from its source to the bay is about 300 miles. The principal towns on the Delaware, besides Philadelphia, are Burlington, Trenton, and Easton.

Delaware Water Gap, Pa., village in Monroe County, on the Delaware River and the Delaware, Lackawanna & Western, the New York, Susquehanna & Western railroads; near Stroudsburg, Pa., 65 miles northwest of New York. The Delaware River, where it passes through the Kittatinny Range of the Appalachian Mountains, forms a gorge about three miles in length, and above the water the sides rise to the height of 1,400 feet.

Delawarr, or **Delaware, Thomas West.** See WEST, THOMAS, LORD DELAWARR, or DELAWARE.

Del'brück, Martin Friedrich Rudolf von, German statesman: b. Berlin 16 April 1817; d. there 1903. Entering public life in 1849 he was made director of the division of commerce and industry, and his part in detaching Prussia from the Austrian commercial policy was considerable. After 1862 Bismarck, then president of the cabinet, supported von Delbrück's commercial ideas, and upon the same principles he negotiated treaties with foreign powers. In 1867 Delbrück was made president of the imperial chancellory. Later he negotiated the treaties which made Germany a unit. For five years after the founding of the empire Delbrück retained his office as president of the general chancellory, now become the imperial chancellory. In 1876 he was dismissed in spite of his reputation and service. Later, as a member of the Reichstag, he dared oppose Bismarck. He retired from the Reichstag in 1881. He published 'Der Zollverein und das Tabaksmonopol' (1857); 'Der Artikel 46 der Reichsverfassung'

Delcassé, Théophile, tā-ō-fēl dĕl-kā-sā, French editor and statesman: b. Pamiers, France, 1 March 1852. For some time on the staff of 'La République Française' and was elected deputy from Foix 1889 and re-elected 1893 and 1898. He was under-secretary of state for the colonies and became minister for the colonies in 1894. He was minister of foreign affairs in Brisson's cabinet, holding the same office under Depuy, Waldeck-Rousseau, and Combes. He settled the «Fashoda Affair» with England and gave an eastern frontier to the possessions of France in Africa. He also concluded a commercial convention with the United States. Owing to disapproval of his Moroccan policy, on 6 June 1905 he resigned his post as minister of foreign affairs.

Deleb' Palm, the *Borassus Æthiopum,* a native of the interior and west of Africa, allied

to and somewhat resembling the Palmyra palm (q.v.). Its leaves and fruits are used by the Africans for the same purposes as those of the Palmyra by the Asiatics, and the tender roots produced by the young plant are extensively used as an article of food. The trunk is swollen about halfway up.

Delécluze, Etienne Jean, ā-tē-ĕn zhŏń dė-lā-klüz, French painter and critic: b. Paris 20 Feb. 1781; d. Versailles 12 July 1863. He was a pupil of David, and although achieving a fair success in painting he abandoned it for criticism 1816. He was connected with several reviews and papers, including the *Moniteur* and the *Journal des Débats,* and the *Revue des Deux Mondes,* being allied with the young literary circle of the Restoration. He also wrote several novels. Among his many works are: 'History of Painting' (1828); 'Mademoiselle Justine de Liron' (1832); 'Life and Works of Leopold Robert' (1838); 'Dona Olympia, the Sister-in-law of Pope Innocent X.' (1842); 'Gregory VII., St. Francis d'Assisi and St. Thomas Aquinas' (1844); 'Louis David, His School and His Times' (1855); and 'Souvenirs of Sixty Years' (1862). In the museum at Versailles there are some curious pen and ink sketches by him of scenes of the invasion of Paris in 1814. Among his paintings are: 'Death of Astyanax'; 'Carrying off Europa'; 'Paris Carrying off Helen'; 'Sacrifice to Ceres', and 'Augustus and Cinna.'

Delegate, a person appointed and sent by another or by others, with powers to transact business as his or their representative. The title was given to members of the first Continental Congress in America 1774. Representatives to Congress from the United States Territories are still designated by this term. They have the right of discussion, but have no vote. A delegate in old English law was one of a body of commissioners, so called because delegated or appointed by the king's commissioners under the great seal, to sit upon an appeal to the king in the court of chancery.

Delegates, Court of, the old English court of appeal, and was so called because the judges thereof were delegated, by the king's commission under the great seal, to hear and determine appeals in the three following cases: (1) Where a sentence was given in any ecclesiastical cause, by the archbishop or his official; (2) when any sentence was given in any ecclesiastical cause in the places exempt; (3) when a sentence was given in the admirals' court, in suits civil and marine, by order of the civil law. This court has been abolished, and the privy council is now the great court of appeal in all ecclesiastical causes.

Delegation, the investing with authority to act for another. Hence the name has been given to a body of persons thus deputed. Before the present Constitution of the United States of America was adopted, the persons constituting the Congress at Philadelphia were called delegates, and the body of representatives of a State in Congress are still called the delegation of a State. In Maryland and Virginia the branch of the State legislatures which, in most of the other States, is called house of representatives, has the name of house of delegates. The name of delegate is also given to the representatives sent to the Congress of the United States from Territories not yet formed into States. In Italy branches of government are often called *delegazione,* and their members *delegati.* Formerly in Lombardy, Venice and the states of the Church the term *delegazione* was applied both to the governor and governing court of a province and to the province itself. The delegate was always a prelate, and directly appointed by the Pope.

In the civil law delegation is that act by which a debtor transfers to another person the duty to pay, or a creditor transfers to another person the right to receive payment.

Delenda, dē-lĕn'da, things to be erased or expunged. *Delenda est Carthago* is the celebrated sentence with which Cato the elder was accustomed to conclude all his speeches in the Roman senate. His hatred of Carthage arose from a jealousy of its flourishing state, and the consequent danger to Rome.

De Leon, Edwin, American prose writer: b. Columbia, S. C., 1828; d. New York 1 Dec. 1891. From 1854 to 1862 he was engaged in editorial work; from 1862 to 1870 held the office of United States consul-general and diplomatic agent at Cairo, Egypt. His published works include: 'Thirty Years of My Life on Three Continents'; 'The Khedive's Egypt,' a novel; 'Askaros Kassis, the Capt'; and 'Under the Star and Under the Crescent.'

De Leon, Thomas Cooper, American author and playwright: b. Columbia, S. C., 21 May 1839. He was auditor Topographical Engineering Bureau, Washington, 1858–61, served in Confederate army 1861–5, and at the close of the war was connected with magazine and newspaper work in Baltimore, New York and Mobile. He organized the Mobile Mardi Gras Carnival and was its manager for 25 years, and has designed carnivals for many other cities for their various celebrations. Among his works are: 'The Rock or the Rye'; 'Creole and Puritan'; 'A Fair Blockade Breaker'; 'The Puritan's Daughter'; 'Four Years in Rebel Capitals'; 'Out of the Sulphur'; 'A Bachelor's Box'; 'An Innocent Cheat'; 'Crag Nest'; 'Life of Joseph Wheeler'; and 'Confederate Memories.'

Delescluze, Louis Charles, loo-ē shärl dė-lā-klüz, French communist: b. Dreux 20 Oct. 1809; d. Paris 28 May 1871. The February revolution opened to him a career in Paris, where his clever and facile pen quickly made him popular with the rabble, but earned him from the authorities imprisonment and a fine of 10,000 francs. Again at Paris in 1853, he was sentenced to two years' imprisonment, and was next transported to Cayenne, where he remained till 1859. His experiences of his sufferings he gave in 'De Paris à Cayenne: Journal d'un Transporté' (1867). After his return he was quiet for some years, until his journal, 'Réveil,' started in 1868 to advocate the doctrines of the International, brought him anew into trouble. In the history of the Paris Commune he played a prominent part, and upon his head rests in great part the guilt of the murder of the hostages, and the burning of the public buildings of the city. He died on the last barricade.

Delessert, Benjamin, bŏń-zhä-măń dė-lĕs-sār, French naturalist and philanthropist: b. Lyons 14 Feb. 1773; d. Paris 1 March 1847. In 1803 he started cotton-spinning in France, but is particularly distinguished by his efforts to pro-

duce beet-root sugar. As early as 1801 he was engaged in refining, but in 1806 he began the experiments which were successfully terminated and announced to Chaptal on 2 Jan. 1812. When he heard of it Napoleon was in ecstasies: "We must see it: let us go," he said. "Delessert," says Flourens, who narrates this incident, "had just time to go to Passy, where his work was. On his arrival he found the gates surrounded by the imperial chasseurs, who refused him admittance. He told them who he was and entered. The emperor had seen and admired everything; excitement was at its height. Approaching Delessert, the emperor took the cross of the Legion of Honor from his own breast and gave it to him. It was announced next day in the *Moniteur* "that a revolution in French commerce had been accomplished.' " Delessert lived through the collapse which the manufacture suffered after Napoleon's fall, and long enough to see it revive and become of the greatest importance.

Delft, or **Delf,** Holland, town in the province South Holland, eight miles northwest of Rotterdam. It stands on a dead flat, and is intersected in all directions by canals, which are crossed by 69 bridges, mostly of stone. These canals make the great market-place with its public buildings an island, approached by nine bridges. The counterscarps of the old ramparts are now planted with trees, and form public walks. The town-hall (*Stadhuis*), in the market-place, is a large, solid-looking building, with a heavy square tower rising from its roof. The Prinsen-hof, once the occasional residence of William I. of Orange, and the scene of his assassination, is now a military barrack. The old Reformed church contains the monuments of Admirals Tromp and Hein, the famous naturalist Leeuwenhoek, and other worthies. The magnificent mausoleum of William, and the burial-place of the Orange family, are in the new church (1412–76); and from its huge square tower the town and neighborhood are from time to time regaled with the richest music from a chime of three octaves; the new church contains also the tomb of Hugo Grotius. Delft has long been the seat of an arsenal, and was formerly the centre of the manufacture of the kind of pottery called delftware or delf. The chief manufactures now carried on comprise firearms, carpets, leather, soap, oil, and gin. In 1654 the powder magazine of the arsenal exploded accidentally, when not a single house entirely escaped, and many persons were killed or maimed. Pop. 32,021.

Delftshaven, dĕlfts-hä'vĕn, or **Delfshaven,** formerly a small independent town in Holland, but included in Rotterdam (q.v.) since 1886. The place is noted as having been the point of embarkation of the Pilgrim Fathers when, in 1620, they sailed for America.

Delftware, or **Delf-ware,** a kind of pottery originally manufactured at Delft, in Holland, in the 14th century. It was among the best of its day, many examples being considered equal to the Italian in quality, but somewhat inferior in its ornamentation. It is covered with an enamel or white glazing which gives it the appearance of porcelain. The glaze of the delftware is made as follows: Kelp and Woolwich sand are calcined together, to form a vitreous mass called frit. Lead and tin are calcined to form a gray, powdery oxide. The frit is powdered and mixed with the oxide, zaffre being added to confer blue color, arsenic for dead-white. This is fused, making an opaque enamel; ground and mixed to the consistency of cream. Delftware is made of a calcareous clay of varying color, strained, and evaporated to a plastic consistency; it is then tempered, and stored in cellars to ripen. Prolonged storage increases its tenacity and plasticity. It is then kneaded without sand; formed on the wheel, dried, and partially burned, reaching the biscuit condition. The bibulous ware is then glazed, dried, packed in saggars, which are piled in the kiln and baked.

Del'hi, India, city in the Punjab, capital of a division of the same name, and anciently of the Patan and Mogul empires; about 700 miles northeast of Bombay, and about 790 miles northwest of Calcutta. It was at one time the largest city in Hindustan, covering a space of 20 square miles, and having a population of 2,000,000. It is now reduced to a circumference of seven miles. A vast tract covered with ruins marks the extent of the ancient metropolis of the Mogul empire. The present city, built on two rocky eminences, is surrounded by walls of red sandstone 30 feet high, and from three to five feet thick, with a moat 20 feet broad. There are seven colossal arched gates, defended by round bulwarks, and all built of freestone. The streets of the old part of the city are narrow, but in the modern portion they are broad. The houses here are of sandstone and brick, and are of two and three stories in height. The palace or residence of the Great Mogul, built by Shah Jehan, commenced in 1631, and finished in 10 years, is by far the most interesting building in Delhi, and the most magnificent structure of the kind in India. The Great Mosque, a magnificent structure in the Byzantine-Arabic style, is considered by the Mohammedans the wonder of the world. It is built of white marble and red sandstone, inlaid like mosaic, in lines and arabesques; at the two extreme corners rise minarets 150 feet high, and between them two lofty domes. This imposing edifice was built by the Emperor Shah Jehan, in the 17th century, and took several thousand men for six successive years (1631 to 1637) to complete it. There are no fewer than 40 other mosques in different parts of the city, many of them having lofty minarets and gilded domes. The fine structure which stands near the Ajmeer gate was formerly the Delhi College. The famous observatory of Jye Singh, rajah of Jyepoor, at the southwest extremity of the city, has been much dilapidated, and its astronomical instruments nearly all destroyed or carried off. A monument was erected in 1888 by the government to Willoughby, one of the heroes of the siege in 1857. The principal manufactures of the town are cotton cloths, indigo, finely embroidered shawls and jewelry, for which, as well as for delicately carved ivory, Delhi is somewhat noted. The chief imports are by the northern caravans, which bring from Cashmere and Cabul shawls, fruit, and horses. Precious stones of good quality are to be had at Delhi, particularly the large red and black carnelians. The agricultural products of the district consist chiefly of wheat, rice, millet, and indigo. The trade of the neighborhood is centred in Delhi, and the Rajputana State Railroad traverses the district.

Delhi, or as anciently called, Indraprastha, is one of the oldest cities of India. The modern name Dilli or Delhi is first met with in the 1st century B.C. It has been taken frequently by hostile powers. In the beginning of the 19th century the prosperity of the city and country around was threatened with destruction, and the Mogul emperor and royal family were reduced to poverty and distress, by the Mahrattas, who took possession of his capital, of his gardens and houses, and used his name to oppress and impoverish the people by fraud and extortion. From this miserable state of desolation and ruin the city was rescued by the British in 1803, when it was entered and taken possession of by Lord Lake. On the breaking out of the Indian mutiny in May 1857, Delhi became the centre of the operations of the rebels, who flocked to it from all quarters. The nominal representative of the Great Mogul, who held the sovereignty of the place under British protection, joined cause with the rebels; and in addition to assuming the character of an independent potentate, gave his sanction to the massacres and atrocities perpetrated on the European residents. By the middle of June a British army assembled in front of the city, and a siege commenced, which, from the smallness of the besieging force, was necessarily slow and protracted. It was brought to a successful termination on 20 September, when Delhi was entered by the British troops, and the nominal sovereignty heretofore possessed by the king was declared ended; and he himself, after being tried for the murders committed under his authority, was found guilty, and sentenced as a convict to perpetual banishment. A large part of the place was reduced to ruins in the mutiny and siege, but it has since recovered much of its former appearance, and has also been much improved in its sanitary condition. Pop. 208,385.

Delhi, N. Y., village and county-seat of Delaware County; on the Delaware River, and a branch of the New York, Ontario & Western Railroad, about 55 miles east of Binghamton. It is in one of the best dairying regions in the country, and the trade is largely in butter, cheese, eggs, and agricultural products. Pop. 2,100.

Delibes, Clément Philibert Léon, klā-môń fē-lē-bār lā-ôń dē-lēb, French composer: b. St. Germain du Val 21 Feb. 1836; d. 18 Jan. 1891. He entered the Paris Conservatoire in 1848, and in 1855 produced an operetta, 'Two Bags of Charcoal.' At the Grand Opera, where he became second director in 1865, his music for the ballet 'The Fountain' (1866), met with great success, and his ballet-music for 'Coppélia' (1870), his finest work, secured his position as a composer. He wrote music for a third ballet and for three comic operas, one of which, 'The King Said So' (1873), became very popular. In 1880 he was appointed professor in the Conservatoire.

Delilah, dē-lī'lä, the Philistine mistress of Samson. She persuaded him to reveal to her the secret of his great strength, and learning that it lay in his long and thick hair, cut off his locks while he was asleep and then treacherously delivered the helpless man into the hands of his enemies.

Delille, Jacques, zhäk dē lēl, French didactic poet: b. Aiqueperse, Auvergne, 22 June 1738; d. Paris 1 May 1813. His translation of Virgil's 'Georgics,' published in 1770, with a 'Discours Préliminaire' and numerous annotations, established his fame and obtained him admission to the French Academy. He became professor of Latin poetry in the College of France, and of belles-lettres at the University of Paris. Though an adherent of the old system, Robespierre spared him on every occasion. At his request Delille wrote the 'Dithyrambe sur l'Immortalité de l'Ame,' to be sung on the occasion of the public acknowledgment of the Deity. His reputation mainly rests on the 'Georgics' and 'Les Jardins,' a didactic poem. Other works are 'L'Homme des Champs'; 'La Pitié'; 'Les Trois Règnes de la Nature'; 'La Conversation'; 'L'Enéide de Virgile.'

Deliques'cence (Lat. "to melt away"), in chemistry the property manifested by many salts, of absorbing moisture from the atmosphere until they become distinctly damp. The name is usually applied to the more pronounced cases, in which the moisture absorbed is so copious that the salt becomes visibly wet, or even dissolves entirely; salts in which the action is less pronounced being called "hygroscopic." Carbonate of potash, caustic potash, and chlorid of calcium are familiar examples of deliquescent substances.

Delirifa'cient, any drug that induces an irritability of the brain leading to forms of delirium. Thus alcohol for some susceptible minds invariably leads to delirium in the early stages, and also induces delirium in chronic poisoning. Belladonna is a drug that causes a certain amount of delirium, as do also cannabis indica, cocaine and its allies. Opium in small doses brings about an exhilaration and for some delirium. Mescal, a drug widely used among the Indians of South America and of the southwestern United States, also induces a form of delirium. Delirifacients are rarely used in medicine for the effect on delirium.

Delirium is a temporary general disturbance of consciousness, a perversion of the intellectual and perceptive faculties, characterized by a greater or less degree of mental irritation or confusion, by more or less transitory delusions and fleeting hallucinations, accompanied by disordered, senseless speech and muttering, and motor unrest. It varies in degree from the ordinary wandering or flightiness of the lower form, to the higher, excited or more violent form, closely approaching mania.

Delirium is one of those conditions or symptoms to which the word "functional" is applicable, since it is not a disease *sui generis.* The word itself is a curious derivative from "de," from, and "lira," a ridge between two furrows. The Latin word *delirare,* signifying to deviate or wander from a straight line, figuratively — to be crazy, deranged, out of one's wits, to be foolish, to rave. Hence the term "wandering" so often associated with, and used to express, the presence of delirium. This wandering need not necessarily imply that of speech alone, for a deaf-mute or an aphasiac may become as delirious as any other person. Delirium is unquestionably experienced by dumb animals.

Continuous or chronic delirium necessarily merges into insanity; though the term delirium should not be used synonymously with insanity, even admitting that the former implies, or pre-

supposes, an unsound mind at the time of its inception.

False beliefs, false or perverted sense perceptions, also constitute a part of the mental condition known as delirium.

Two distinct varieties of delirium are recognized (although transient forms exist), namely, the primary active or wild form, *delirium acutum, delirium grave,*—and the secondary or lower form. The former is not an individual affection, but a condition of varying mental disturbance which occasionally attends different states of bodily disorder such as collapse, intoxication, katatonia, etc., and often, if not altogether, dependent upon, at least associated with, demonstrable lesions of the gray matter of the brain. It is characterized by increased restlessness, in which the patient tries to escape from bed, shouts, struggles with imaginary enemies and requires physical or even mechanical restraint. This form is generally associated with alcoholics (delirium tremens).

The secondary or lower form is by far the most common, and less understood, the patient lying with comparative quietness but incessantly engaged in incoherent and disjointed converse with imaginary personages, or communing with his own disordered brain. It generally appears in the exanthematous diseases of children, measles, scarlet fever, etc., also in the second and third weeks of typhoid fever.

The outset of delirium may be sudden or slow. If coming slowly, the first indication of its presence may be a certain confusion and difficulty in recognizing surroundings, after awakening from sleep; the mental confusion lasting a longer period on each occasion and finally developing into a well-marked delirium. A practical point to bear in mind is that a quiet delirium may shift very suddenly into an active one.

There are innumerable causes of delirium, the more prominent ones being infectious fevers, in the young and able-bodied, diseases dependent upon some specific micro-organism, such as is seen in typhoid fever, pneumonia, scarlet fever, yellow fever, puerperal fever, pyemia, and malaria; although delirium occurs also in analogous diseases not proven directly due to any specific micro-organism, also in trauma. Surgical operations are frequently followed by delirium.

In the delirium of intoxication the causes may be divided into endogenous and exogenous, the former arising from within the body proper, such as septic intoxication, pyemic or uremic absorption, cholemia, diabetes, auto-intoxication and insolation, that is, sunstroke. The latter (exogenous) causes are alcohol, drugs, mydriatics, for example, belladonna, duboisin, atropin. Also cocaine, morphine, mineral poisons, for example, iodoform.

Delirium due to exhaustion and inanition is seen in acute anæmia, resulting from hemorrhage of any cause, or the presence in the blood of powerful hæmic poisons, for example, plasmodium of malaria. It is also due to wasting diseases and lactation.

Delirium may originate in central or peripheral lesions of the brain, for example, blood clot from accidental injury, trauma, surgical operations, meningitis or encephalitis. Delirium may also be due to, or associated with, central depression, notably that occasioned by epilepsy, hysteria major, etc.

Delirium of senility is due to inanition and pathologic changes in the cerebral vascular supply.

The delirium of disease, or acute delirium, resembles that arising during febrile diseases; it is ordinarily accompanied by rise of temperature, which pursues no definite course, and by rapid and progressive body weakness (asthenia), and the typhoid state. The treatment consists of utilizing remedial agents that rapidly produce sleep, and fighting the progressive weakness, by stimulating drugs and nutrition, quieting the motor unrest and reducing fever by hydrotherapy, etc.

Mild forms of delirium, such as occur in children suffering from measles, auto-infection from the gastro-intestinal tract, etc., require no treatment *per se,* the treatment being directed against the exciting cause. In typhoid fever and pneumonia delirium is best controlled by the ice pack or sponging with cold water and cold bath. The early inception of delirium in these fevers is a grave and dangerous symptom.

The treatment of delirium in general is first: Induce sleep, and quiet motor unrest; this is best accomplished by the reduction of fever, the exhibition of proper narcotics, thorough cleansing of the intestinal tract, and hydrotherapy. In the selection of hypnotics, the one or the group which is followed by the least depression is advisable. Hyoscamine, in sthenic cases is safe and reliable. Bromide of potassium, chloral hydrate, hyoscin, morphine and opium and the various synthetic coal tar derivatives are frequently used. Second: Discover, if possible, and remove the inciting cause of delirium; to do this the pathological factor must be determined and treated accordingly.

Delirium Tremens. See DELIRIUM.

De Lisle, Charles. See LECONTE DE LISLE, C.M.R.

Delisle, Guillaume, gē-yōm dė-lēl, French geographer: b. Paris 28 Feb. 1675; d. there 25 Jan. 1726. He was instructed by Cassini, and soon conceived the idea of reforming the whole system of geography. He published, in his 25th year, a map of the world, maps of Europe, Asia, and Africa, and a celestial and a terrestrial globe of a foot in diameter. By rejecting Ptolemy's statements of longitude, or rather by comparing them with the astronomical observations and the statements of modern travelers, he founded the modern system of geography.

Delisle, Joseph Nicolas, zhō-zĕf nĭk-ō-lä, French astronomer: b. Paris 4 April 1688; d. there 11 Sept. 1768. He was a brother of Guillaume Delisle (q.v.). Among his works are: 'Mémoires pour servir à l'histoire et au progrès de l'astronomie' (1738); 'Mémoire sur les nouvelles découvertes au nord de la Mer du Sud' (1752).

Delitzsch, Franz, German Hebraist and theologian: b. Leipsic 23 Feb. 1813; d. there 4 March 1890. He was educated in the university of his native city, became professor of theology at Rostock in 1846, at Erlangen in 1850, and in 1867 at Leipsic. His earlier works dealt with post-biblical Jewish literature, and he afterward wrote commentaries on various books of the Old Testament. He was also the author of numerous theological and devotional works, among which were 'Biblico-prophetic Theology' (1845); 'The House of God' (1848); 'Biblical

Psychology' (1855); 'Jesus and Hillel' (1867); 'Christian Apologetics' (1869). He was chiefly eminent as a commentator on the Old Testament, and his honesty as a theologian was shown in the concessions he was willing to make (in the last edition of his commentaries on Genesis and Isaiah, 1887) to the latest critical views of the Pentateuch.

Delitzsch, Friedrich, frēd'rĭH dā'lĭch, German Assyriologist: b. Erlangen, Bavaria, 5 Sept. 1850. He is a son of Franz Delitzsch (q.v.). He has published among other works: 'Assyrian Studies' (1874); 'Where is Paradise?' (1881); 'Prolegomena of a New Hebrew and Aramaic Vocabulary to the Old Testament' (1886); 'Assyrian Vocabulary' (1887 onward); 'Assyrian Grammar' (1889); 'Assyrisches Handwörterbuch' (1894–6); 'Das Babylonische Weltschöpfungsepos' (1896); and a translation of George Smith's 'Chaldean Account of Genesis.' In 1877 he became extraordinary professor in Leipsic, ordinary professor at Breslau in 1893, and in 1899 professor of Assyriology in the University of Berlin.

Delitzsch, Germany, a town of Prussian Saxony, on the Löbber, 15 miles north of Leipsic. The manufactures are chiefly woolen goods; several important fairs are held each year. Pop. 9,560.

Delius, dā-lē-oos, Nikolaus, German Shakespearian critic: b. Bremen 19 Sept. 1813; d. Bonn 18 Nov. 1888. He studied philology at Bonn and Berlin, and in England and France. He settled in 1846 in Bonn, where he became extraordinary professor in 1855, and professor in 1863. He published a critical edition of Shakespeare (1854–61).

Delivery, in law (1) the delivery of a deed, or the handing of it over to the grantee, which is expressed in the attestation, "sealed and delivered," and is one of the requisites to a good deed. A deed takes effect only from this delivery; for if the date be false or impossible, the delivery ascertains the time of it. A delivery may be either absolute, that is, to the grantee himself, or to a third person, to hold till some conditions be performed on the part of the grantee. In certain cases, as wills, bonds made by a parent in favor of his children, or deeds in which the grantee has himself an interest, or where there is a mutual obligation between the parties delivery is not required. (See DEED.)

(2) An expression peculiar to England, also called jail delivery, a term applied to the sessions at the Old Bailey, London, or the assizes, when the jail is delivered or cleared of the prisoners.

Delivery. See OBSTETRICS.

Della Cruscans, dĕl'la krŭs'kanz, a coterie of English poetasters resident about 1785 in Florence (and so named from the Accademia della Crusca of that city), who took to penning verses, which they published under the name of the 'Florence Miscellany.' Notwithstanding the inconceivable silliness and affectation of these productions they found numerous admirers. The newspapers of the day began to give publicity to their lucubrations. Genuine poetry seemed for a time at a discount, and nonsense and Della Crusca prevailed. The frenzy was, however, of short duration. The 'Baviad' (1794) and 'Mæviad' (1796) of William Gifford swept the butterfly Orlandos, Carlos, Lauras, Marias, "and a thousand other nameless names" into merited oblivion.

Della Maria, Dominique, dōm-ē-nēk dĕl-lä mä-rē-ä, French musician: b. Marseilles 1768; d. Paris 9 March 1800. He was very precocious, but his fame rests upon the score he wrote for 'The Prisoner' by Duval.

Della Robbia, Luca. See ROBBIA, LUCA DELLA.

Della Robbia Ware, brown terra-cotta bas-reliefs thickly enameled with tin-glaze; made at Florence (chiefly in 1450–1530); in France (1530–67); so called from the name of the artist and its attributed inventor, Luca Della Robbia. The most important and largest work in this ware, perhaps, is the frieze on the hospital at Pistoia, made after the artist's death. At Tamworth, England, there is a plant, founded in 1847, that turns out this style of pottery, especially for architectural decorations, with great success.

Dellys, dĕl-lēz', Algeria, a seaport in the department of Algiers, 49 miles east of the city of Algiers. The inhabitants are mostly French and Arabs. It contains the mosque of the Mohammedans and the mission school of the Christians. The trade is principally in grain, oil, and salt. Pop. 3,987.

Delmar, Alexander, American political economist: b. New York 9 Aug. 1836. He established the 'Social Science Review' and was its editor in 1864–6. He is the author of 'Gold Money,' and 'Paper Money' (1862); 'Essays on Political Economy' (1865); 'Letter on the Finances' (1868); 'History of Money in Ancient Countries' (1884); 'The Science of Money'; 'The National Banking System'; 'Statistical Almanac'; 'The History of Money in America' (1899); etc.

Delmonte y Tejada, Antonio, än-tō'nē-ō dāl-mōn'tā ē tä-hä'dä, Dominican historian: b. Santiago de los Caballeros, Santo Domingo, 29 Sept. 1783; d. Havana 19 Nov. 1861. He is the author of 'Historia de Santo Domingo' (1853), a history of the island from its discovery.

Delolme, Jean Louis, zhŏn loo-ē dē-lōlm, Swiss writer: b. Geneva in 1740; d. Switzerland 16 July 1806. He at first practised as a lawyer in his native city, but the part which he took in its internal commotions obliged him to go to England, where he passed some years in great poverty. He became known by his once-celebrated but superficial 'Constitution de l'Angleterre,' translated by the author himself into English in 1772. Delolme also published in English his 'History of the Flagellants or Memorials of Human Superstition' (1783); an 'Essay on the Union with Scotland' (1796). He returned to Switzerland about 1775.

De Lome, Enrique Dupuy, ĕn-rēk' dü pwē' dē-lōm, Spanish diplomatist: b. Valencia, Spain, August 1851; d. Paris, France, July 1904. He became first secretary of the Spanish legation in Washington in 1882, and minister to the United States in 1892 and 1895. In February 1898 it was discovered that he had written a letter to Señor Canalejas, a Spaniard of high rank who had been in the United States a short time previous supposably to make observations for the Spanish government. The letter, which followed Canalejas to Havana, and was

probably abstracted from his apartments there by some friend of the insurgents, contained disparaging phrases regarding the President of the United States, and otherwise plainly showed that neither the writer nor the recipient of it believed that Spain was acting in good faith with the United States government. De Lome at first denied the genuineness of the letter, but it was proved beyond a doubt that he was the author, and he telegraphed his resignation to Madrid on February 9.

De Long, George Washington, American naval officer and Arctic explorer: b. New York 22 Aug. 1844; d. Siberia 30 Oct. 1881. Graduating from the Naval Academy in 1865, he reached the grade of lieutenant-commander, and perished of cold and exposure while in command of the Jeannette Expedition in 1879–81. His journals have been published, entitled 'The Voyage of the Jeannette' (1883); and the story of the search for the survivors is told in Melville's 'In the Lena Delta' (1884).

Deloo', an African antelope, one of the duiker-bok (q.v.).

Delorme, Marion, mä-rē-ôṅ dė-lôrm, French courtesan: b. Blois 3 Oct. 1613; d. Paris 2 July 1650. Her beauty and wit soon made her house the rendezvous of all that was gallant and brilliant in Paris. The king, the princes of Condé and Conti, Buckingham, Cinq-Mars, St. Evremont, were among her admirers. The leading spirits of the Fronde regularly assembled in her house, and she is said to have assisted them in their enterprises. Mazarin was about to have her arrested when she died suddenly. The legend arose in France that the death and funeral were a mere pretense, got up to permit her to make her escape. She is said to have crossed over to England and married a rich lord, who shortly afterward died. She then returned to France, married a chief of brigands, who was captivated by the charms of his victim. After his death she married a procurator of finance in Franche-Comté, with whom she spent 22 years of her life. Upon his death prosperity forsook her. Plundered by adventurers and her own servants, she died in extreme poverty in 1706, or according to another story in 1741, at the age of 129 years. Victor Hugo has taken her as the subject of one of his dramas.

De l'Orme, Philibert, fē-lē-bār, French architect: b. Lyons 1515; d. Paris 8 Jan. 1570. He studied in Rome, aided by Cardinal de Ste. Croix, and became the favorite architect of Henry II. and Diane de Poitiers. On the death of Henry II. he remained in disfavor for some time. He began the Tuileries for Catharine de Medici. The Château d'Anet, begun in 1552, is one of his chief works. He wrote two books which were long a high authority on architecture.

Delorme, Pierre Claude François, pē-ār klōd fräṅ-swä, French genre painter: b. Paris 28 July 1783; d. there 8 Nov. 1859. He was a pupil and imitator of Girodet. Among his works are: 'Death of Abel' (1810); 'Hero and Leander' (1814); 'Raising of Jairus' Daughter' (1817), in Church of St. Roch, Paris; 'Christ Reappearing' (1819), in Notre Dame, Paris; 'Cephalus Carried Off by Aurora' (1882), in the Luxembourg; 'Hector Reproaching Paris' (1824); 'Sappho Reciting an Ode to Phaon' (1833); 'Eve Plucking the Forbidden Fruit' (1834); 'Magdalen at the Sepulchre' (1835); 'Adam and Eve After the Fall' (1839); 'Holy Family in Egypt' (1850).

Delort, Charles Edouard, shärl ā-doo-ār dė-lôr, French painter: b. Nîmes 4 Feb. 1841; d. 10 March 1895. He was a pupil of Gleyre and of Gérôme. Among his works are: 'Daphnis and Chloe'; 'The Stolen Cattle' (1866), Museum of Nîmes; 'Confidence'; 'Starting for the Chase' (1873); 'Marauders' (1874); 'Embarking of Manon Lescaut' (1875); 'After Breakfast' (1876); 'A Poacher'; 'Admonition' (1880); 'Capture of the Dutch Fleet by the Hussars of the French Republic' (1882); and 'Return from Exile' (1889).

Delos, dē'lŏs (ancient ASTERIA; CYNTHUS; ORTYGIA), the central and smallest island of the Cyclades, in the Ægean Sea, a rugged mass of granite about two square miles in extent. Delos, according to old legends, was raised from the sea-bottom by Poseidon. It was then a naked rock floating about in the ocean, and was accidentally driven by the waves into the centre of the Cyclades. The Earth had promised Hera (Juno), with an oath, not to grant a resting-place to the fugitive Latona where she might be delivered. The unhappy goddess wandered restlessly over the earth until she perceived the floating island. As this was not stationary, it was not comprehended in the oath of the Earth, and offered her an asylum. Here Latona bore the infant gods Apollo (who was hence called *Delios*) and Artemis (who was called *Delia*). Both were worshipped on this island. Delos was thenceforth no longer the sport of the winds; it was moored to the bottom of the Ægean with adamantine chains by Zeus, and the fame of the isle spread over the world. Thus far mythological tradition.

At an early period the island, occupied by the Ionians, had kings of its own, who also held the sacerdotal office. In the course of time it came under the dominion of Athens. In 477 Delos became the common treasury of the league against Persia, but the money was afterward transferred to Athens. In 426 the Athenians purified Delos by removing all the tombs, and thenceforth they prohibited births and deaths from taking place on the island. In 422 they removed all the Delians from the island in order to complete its purification, but soon afterward these were allowed to return. After the destruction of Corinth the rich Corinthians fled thither, and made Delos the seat of a flourishing commerce. Delos had a famous temple of Apollo, built of Parian marble, and containing, besides the beautiful statue of the god, a remarkable altar, from which the Delian problem (Doubling the Cube), as it is called, had its name. The inhabitants, having consulted the oracle concerning the remedy of a plague which raged in Delos, were ordered to double the altar of Apollo, which was a cube. A solution of this problem of the duplication of the cube was attempted in different ways by several of the ancient mathematicians. The Grecians celebrated the Delian festival here every five years; and the Athenians performed annually the pilgrimage called *theoria*, with processions and dances. Delos was celebrated in ancient times for the number and the excellence of its artists, and workers in silver and bronze. Cicero, in his

oration for Roscius, has many eulogiums upon the fine vases of Delos and Corinth. Delos, called Dili or Sdili, is now without permanent inhabitants; a few shepherds from the neighboring islands pay it summer visits with their flocks. Some ruins of its former magnificence yet exist. Among these are remains of the Temple of Apollo above referred to, of one to Latona, of an amphitheatre, etc., besides a curious primitive temple of Apollo, called the Cave of the Dragon, which is not a real cave.

Since 1877 the French School at Athens has been making excavations on the island of Delos, largely under the direction of Théophile Homolle. The procedure has been slow and economical and the results excellent. Homolle, who previously carried on excavations at Delphi, was appointed by President Loubet director of the Louvre Museum. According to the report made to the Institut de France by Prof. Dürbach, Delos is the only ancient Greek city that remains approximately intact. It may almost be termed the Greek Pompeii in view of the scientific results which it has yielded. The complete plan of the sacred precinct of Apollo has been recovered; together with the theatre, the temple on Mount Cynthus, the temples of foreign gods, and an extensive part of the commercial section of Hellenistic and Roman days. Sculpture of all periods has been found in abundance, as well as inscriptions throwing light on various points of discussion. Joseph Florimund, Duc de Loubat (Papal nobility), an American, placed at the disposal of Homolle a yearly sum of $10,000 to continue until the excavations are finished.

From the ancient mole, there is an approach to the precinct of Apollo through an avenue flanked by porticoes. The temple of Apollo is the centre of the precinct. It is a Doric work, with 13 columns at either side, and 6 in front and rear; and having comparatively few sculptural decorations. It dates from the early 4th century B.C. The decorative groups on the two gables have been in part recovered, and are now in the National Museum, Athens. To the north of the precinct of Apollo are large remains of the commercial Delos. In the 2d and 1st centuries B.C., Delos was the chief commercial town of the eastern Mediterranean. The most extensive building in this region is a kind of exchange, with a very large court encircled by apartments. The shore, facing Rhenea, is lined with docks and warehouses. A well of six metres in depth was found filled with tablets of marble and bronze, having upon them 20 ancient inscriptions regarded as of great value. The sanctuaries contain exvotos, stelæ, and inscriptions on marble and bronze giving in full detail accounts of the high priests and catalogues of the offerings brought by pilgrims. Streets, gardens, and sewage canalization may all be distinctly traced. Interesting private houses have also been discovered. Mention should also be made of the long and narrow hall, extending north and south and entered through a portico at its southern end, having at its northern end the famous "altar of horns," composed of the horns of the victims and accounted one of the seven wonders of the world. The entire building is often called "The Sanctuary of the Bulls," from the design of the capitals of the two columns separating the altar from the remainder of the hall. Consult Homolle, 'Les Archives de l' Intendance Sacrée de Délos'; Diehl, 'Excursions in Greece' (Eng. trans. by Perkins 1893); 'Bulletin de Correspondance Hellénique' (1877).

Del'phi, the seat of the most famous oracle of ancient Greece, was situated in Phocis, on the southern side of Parnassus. Apollo, according to fable, having killed the serpent Python, and determining to build his sanctuary here, perceived a merchant vessel from Crete sailing by. He immediately leaped into the sea in the form of an immense dolphin (Greek, *delphis*), took possession of the vessel, and forced it to pass by Pylos, and to enter the harbor of Crissa, not far from Delphi. After the Cretans had landed he assumed the figure of a beautiful youth, and told them that they must not return to their country, but should serve as priests in his temple. Inspired, and singing hymns, the Cretans followed the god to his sanctuary on the rocky declivity of Parnassus; but, discouraged by the sterility of the country, they implored Apollo to save them from famine and poverty. The god, smiling, declared to them the advantage which they would derive from serving as his priests. They then built Delphi, calling the city at first Pytho, from the serpent which Apollo had killed at this place.

The oracles were delivered from a cave called Pythium. Tradition ascribes its discovery to a shepherd who pastured his flocks at the foot of Parnassus,and was filled with prophetic inspiration by the intoxicating vapor which arose from it. Over the cave, which was contained in a temple, was placed the holy tripod, upon which the priestess called Pythia, by whose mouth Apollo was to speak, received the vapors ascending from beneath, and with them the inspiration of the Delphian god, and proclaimed the oracles (hence the proverb, to speak *ex tripode,* used of obscure sentences, dogmatically pronounced). After having first bathed herself, and particularly her hair, in the neighboring fountain of Castalia, and crowned her head with laurel, she seated herself on the tripod, which was also crowned with a wreath of the same, then, shaking the laurel tree and eating perhaps some leaves of it, she was seized with a fit of enthusiasm. Her face changed color, a shudder ran through her limbs, and cries and long protracted groans issued from her mouth. This excitement soon increased to fury. Her eyes sparkled, her mouth foamed, her hair stood on end, and almost suffocated by the ascending vapor, the priests were obliged to retain the struggling priestess on her seat by force; then she began, with dreadful howlings, to pour forth detached words, which the priests collected with care, arranged them, and delivered them in writing to the inquirer. At first the answers were given in verse, or were put into hexameters by priests of the temple who were poets, but in later times, the authority of the oracle being diminished, they contented themselves with delivering them in prose.

This oracle was always obscure and ambiguous; yet it served, in earlier times, in the hands of the priests, to regulate and uphold the political, civil, and religious relations of Greece. It enjoyed the reputation of infallibility for a long time; for the Dorians, the first inhabitants of the place, who soon settled in all parts of Greece, spread an unbounded reverence for it. At first only one month in the year was assigned for the

delivery of oracles; afterward, one day in each month; but none who asked the god for counsel dared approach him without gifts. Hence the splendid temple possessed immense treasures, and the city was adorned with numerous statues and other works of art, the offerings of gratitude. Delphi was at the same time the bank in which the rich deposited their treasures, under the protection of Apollo, though this did not prevent it from being repeatedly plundered by the Greeks and barbarians. Although the sanctuary and its treasures had been almost miraculously preserved from the Persians and Gauls, they were forced by Sulla to contribute to the payment of his soldiers, and Nero removed 500 brazen images from the sacred precincts. Constantine the Great enriched his new city by the sacred tripods, the statues of the Heliconian Muses, the Apollo, and the celebrated Pan dedicated by the Greek cities after the conclusion of the war with the Medes.

The ancients believed Delphi to be the centre of the earth: this, they said, was determined by Jupiter, who let loose, from the east and from the west, two eagles, which met here. The tomb of Neoptolemus (or Pyrrhus), son of Achilles, was at Delphi, and near it the famous Lesche, adorned by Polygnotus with the history of the Trojan war. In the plain between Delphi and Cirrha the Pythian games were celebrated. These national games, and the protection of the Amphictyons, gave Delphi a lasting splendor. It is now a village called Castri, near which the Castalian spring may still be seen.

In 1892 the site of Delphi, until that time occupied by the village of Castri, was purchased by the French government, a new village was established farther westward, and the French School at Athens, under the direction of Théophile Homolle, began important excavations. The entire precinct has been revealed, and, with the assistance of Pausanias' 'Itinerary,' many structures have been identified, including the altar, temple, stadium, theatre, treasuries, and other buildings. More than 3,000 inscriptions have been found, many of great value for Grecian history. The sculpture discovered contributes much to the history of art in the late 6th and early 5th century B.C. The ancient wall (the Hellenico), extending east and west, has been recovered in its entire length, and the two boundary walls, climbing the hill at either end of the Hellenico, have been traced. The main entrance was in the eastern of these two walls, and from this the Sacred Way proceeds by a zigzag course to the temple. Just within the precinct wall, on the northern side of the Sacred Way, stood the large building dedicated as an offering by the Lacedæmonians after the battle at Ægospotamos (q.v.). To the west, on the southern side of the way, was the Sicyonian treasury, in the form of a Doric temple, distyle *in antis*. Still farther westward, on the same side of the way, is the Cnidian treasury, originally a small marble Ionic temple, distyle, with a sub-structure of tufa. The sculpture from the pediment and frieze of this building, and the fragments of moldings, are of very considerable interest. The structure has been described as perhaps the most nearly perfect extant example of the transitional style of the early 5th century B.C. Here the Sacred Way makes a decided turn; and farther north, but still on the same side of the way, is the Athenian treasury — a Doric temple *in antis*, of small size, with a basis bearing the remains of a dedicatory inscription which announces that it was built with the spoils from the battle of Marathon (q.v.). It was on stones in this treasury that the hymns to Apollo with ancient musical notation were found. Beyond this treasury was the many-fluted "Column of the Naxians," which supported the colossal marble sphinx, now in the museum.

The site of the temple shows the remains of various successive buildings. Many remains have been recovered of that built by the Alcmæondis (6th century), which was destroyed by an earthquake. Some archaic sculptures discovered have been assigned to the gables of this structure. The foundations now extant are those of the temple built in the 4th century. No definite information can be gained as to the oracle. The theatre, in the northwest corner of the precinct, dates from the early 2d century and is one of the best preserved in all Greece. The walls and seats of the auditorium remain; there are 33 tiers of seats arranged in seven sets, with a paved longitudinally-intersecting passage, or diazoma. Consult the 'Bulletin de Correspondance Hellénique,' and the 'Comptes Rendus de l'Académie des Inscriptions.'

Delphi, Ind., a city of Carroll County, of which it is the county-seat, about 20 miles southwest of Logansport, and 60 miles north by west of Indianapolis; on the Wabash River and the Louisville, New Albany, and Chicago, the Wabash, and other railways. The water-power is excellent. There are lime-works, the lime interests being extensive; besides paper-mills, wagon and carriage manufactories, flour and planing-mills, and a bent-wood factory. Pop. (1890) 1,923; (1900) 2,135.

Delphin (del'fĭn) **Classics** (*Auctores Classici in usum Serenissimi Delphini*), a collection of the works of the Latin classic authors, prepared by order of Louis XIV., at the suggestion of the Duke of Montausier for the use of the dauphin of France. The Duke of Montausier was the dauphin's governor, and in making a selection of authors, texts, and editors, employed the services of Bossuet, "the Eagle of Meaux," and Huet, bishop of Avranches, both preceptors to the young prince. This collection of the Latin classics does not comprise all the works of Latin writers that are extant, and it contains a few authors to whom the title classic can be given only by a very generous interpretation of the word. A notable omission of a genuine classic is the 'Pharsalia' of Lucan, which seems to have been dropped, as having no place in the library of the heir of an absolute monarch. The series was completed in 64 volumes 4to, including a 'Dictionary of Antiquities' in one volume. The text is accompanied by copious explanatory notes (in Latin), and, in the case of all poets and of difficult prose writers (Tacitus, for instance), by an interpretation in easier Latin. The same is done in the case of all difficult phrases occurring anywhere in the prose authors. The complete works of the several classics, as far as extant, are given; as well as the spurious works commonly attributed to them. A valuable feature of this collection is the very complete verbal index to the works of each author. In the years 1819–30

Valpy, of London, republished the Delphin Classics, with the whole of the notes and interpretations, but usually with the texts as amended by later critical research. To the notes of the Delphin edition Valpy added very voluminous *Notæ Variorum.* These last far exceed in bulk both the text and notes of the original Delphin Classics.

Delphine, dĕl-fēn, a romance by Madame de Staël, published in 1802. Its bold imagery, keenness of observation, and power of impassioned description, perhaps justify 'Delphine's' position among the masterpieces of French literature. But neither situations nor characters are true to nature. The romance had a special interest for Madame de Staël's contemporaries, for several of the great men and women of the time appear in it under the thinnest of disguises. As in the case of «Corinne,» the liberal ideas scattered through the story drew down on the author the anger of Napoleon, who ordered her to leave France.

Delphin'ia, a festival celebrated in honor of Apollo (Delphinios being one of his names) at Athens, on the 7th of the month Munychion (April). On this occasion a procession of girls bearing garlands, marched to the temple of the god to seek his favor more especially, perhaps, in the interests of seamen.

Delphin'idæ, the dolphin family of cetaceans. See DOLPHIN; NARWHAL; PORPOISE.

Delphin'ium, a genus of beautiful annual and perennial plants of the crowfoot family (*Ranunculaceæ*), with large irregular flowers, comprising about 60 species, natives for the most part of the north temperate zone; some few species are found in the mountains of Mexico. The name is a reference to the supposed resemblance to a dolphin. The genus is represented in America by about 25 species, which are known as larkspur, with blue or purple flowers, rarely white. The field larkspur (*D. consolida*) is found in waste places in southern New Jersey, Pennsylvania and farther southward, naturalized from Europe. It has for a companion at times (*D. Ajacis*) the cultivated larkspur, which has escaped from gardens. The cultivated plants have shorter spurs and longer and denser racemes of flowers. The tall larkspur (*D. urecolatum*) is found in the woods of central Pennsylvania, west to Minnesota, south to Nebraska, northern Alabama, and North Carolina. Other species extend the habitat of the genus, north to Manitoba and south and west to Texas. From the European (*D. staphisagria,* stavesacre) is extracted an alkaloid known as delphinine. The field larkspur is a simple astringent.

Delphinus, dĕl-fī'nŭs (the dolphin), one of Ptolemy's original 48 constellations, situated between Vulpecula, Pegasus, Equuleus, Aquarius, and Aquila. It has no stars brighter than the third magnitude. The names Sualocin and Rotanev assigned to its stars Alpha and Beta, are merely reversals of the name Nicolaus Venator, an astronomer's assistant, who wished to commemorate himself.

Delphos, Ohio, city in Allen and Van Wert Counties, situated on the Miami & E. C., the N. O., the Pittsburg, Ft. W. & C., and other railroads; about 70 miles southwest of Toledo. The principal industries of the city are the Fort Wayne railroad repair shops, and manufactures of furniture and wooden ware. Pop. (1900) 4,517.

Del Rio, dĕl rē'ō, Texas, county-seat of Vel Verde County; about five miles from the Rio Grande River; on the Southern Pacific Railroad. Its industries are those of an agricultural and stock-raising region, and it has several small cotton and wool manufacturing plants. Pop. (1900) 2,500.

Delsarte, François Alexandre Nicolas Chérie, frăn-swä ä-lĕks-ändr nīk-ō-lä shā-rē dĕl-särt, French educator: b. Solesmes 19 Dec. 1811; d. Paris 19 July 1871. He attained distinction as a tenor singer in the Opéra Comique, suddenly lost his voice, and thereafter applied himself to musical and dramatic instruction, having among his pupils many who afterward achieved operatic and dramatic celebrity. He was author of several melodies and romances, but his chief work was the elaboration of a system of dramatic expression, by which the voice and entire action of the body were trained by fixed rules. He aimed to make elocution a science. His system, at least in part, has of late been gaining many adherents among elocutionists.

Delsarte Method. See GYMNASTICS.

Delta, the name of the fourth letter of the Greek alphabet, the capital form of which is an equilateral triangle. The name is also applied to a tract of land triangular in shape, generally formed by the deposit of river sediment, especially at the mouths of rivers which flow into lakes or seas. A mountain stream changing the force and rapidity of its current upon entering a level plateau deposits at the base of the mountain sediment which assumes the triangular form and is called a cone-delta or a fan-delta, or an alluvial fan.

The nature of the current in the body of water receiving the river deposit has much to do with the size of the delta. A swiftly-flowing current or high tides carry off the deposit from the shore line, sometimes forming long coast islands or sand-bars or sand-spits, or distributing the sediment over the ocean bed; but slowly moving waters are conducive to large deltas. The almost tideless Mediterranean and Gulf of Mexico have deltas at the mouths of the large rivers which bring deposits to the sea. Usually the finest particles of land waste are swept away by currents, but the rest accumulates at the mouth of the river and builds up a fan-shaped land mass, or delta, in front of the old shore line. Old rivers that bring down much sediment, may, if the coast is neither uplifted nor depressed, build deltas of great size. In the case of a river emptying into a sea even the fine waste brought down falls to the bottom before long, as the salts in the sea water precipitate matter in suspension. The river usually enters the sea over the front of its delta by several channels, these branches of the main stream being called distributaries. An excellent example is the way the Mississippi divides up at its mouth. As a large river bringing down waste can build a delta even where waves and tidal currents are active in distributing the material, the absence of a delta at the mouth of a large river indicates generally some recent change of level. Thus the absence of deltas along the Atlantic coast of the United States is due to a slow depression of the coast, still in progress. This submergence of the coast has

a tendency to create estuaries at the mouths of rivers. Some notable deltas are those of the Po, Hoangho, Ganges, and Niger. As showing how rapidly a delta may grow, Adria in Italy was a seaport in the time of Augustus, but the growth of the Po delta has left it 20 miles inland. The Mississippi delta is advancing into the Gulf of Mexico at the rate of one mile in 16 years. The Mississippi delta is, in area, about 12,500 square miles; that of the Nile about 10,000 square miles. Large rivers frequently change the channel of their distributaries, thus making the deltas unsafe for dwelling places. Consult: Geikie, 'Elementary Lessons in Physical Geography,' and 'Text Book of Geology'; Tarr, 'Physical Geography.'

Delta Metal, an alloy containing 56 parts of copper, 42 of zinc, and 2 of iron. It is said to be as strong as mild steel, over which it has the advantage of not rusting by exposure to the weather. Delta metal is largely used in England and Germany, and is also employed in the United States, though to a more limited extent.

Delta Territory, Venezuela, the delta of the Orinoco River, bounded on the north and east by the Gulf of Paria, the Atlantic Ocean, and British Guiana; on the south by the Yuruari territory; on the west by the Maturin section of the old state of Bermudez (now divided into states of Barcelona and Sucre). Its numerous streams and low-lying coasts are not well adapted to navigation of large vessels. Pedernales, a small town on the Gulf of Paria, is the capital. Pop. of territory about 2,500.

Deltoid Muscles. See MUSCLES.

Deluc, Jean André, zhŏn än-drā dė-lük, Swiss geologist and meteorologist: b. Geneva 8 Feb. 1727; d. Windsor, England, 8 Nov. 1817. He passed the first half of his life in commercial pursuits. In 1773, obliged by commercial disaster to quit his native city, he went to England, was elected a Fellow of the Royal Society of London, and appointed reader to the queen, a situation he held for 44 years. He made numerous geological excursions in central Europe and in England, of which he has published accounts. He enriched science with very important discoveries. Among his numerous writings are his 'Recherches sur les Modifications de l'Atmosphère' (1772); 'Nouvelles Idées sur la Météorologie' (1786); 'Traité élémentaire de Géologie' (1810).

Deluge (through the French, from Lat. *diluvium,* "a flood"). There is scarcely any considerable race of men among whom there does not exist, in some form, the tradition of a great deluge, which destroyed all the human race except their own progenitors. The classical story of Deucalion and Pyrrha is but a typical example of similar myths found everywhere, and savages and fathers of the Church alike have argued that the shells, corals, and other marine objects often found on the tops of mountains, offered distinct proof of the historical reality of a deluge. That the Noachian deluge recorded in Scripture covered the whole earth and destroyed all mankind save one family, was the universal opinion until toward the close of the 18th century. The organic remains, on which the science of palæontology is now founded, were regarded as its wrecks, and were held to prove that it had covered every known country, and risen over the highest hills. In the progress of geology, it soon became evident that most of the stratified rocks demanded an earlier origin than a few thousand years, and the influence of the deluge was consequently restricted to the slightly altered superficial deposits; but many of these were, after a few years, found to belong to a period vastly anterior to any historical epoch, and to have been produced by long-continued and persistent agencies, differing totally from a temporary cataclysm. The more common modern opinion regards the flood of Noah as partial and local, although the universality seems fairly enough to be implied in the biblical description, and although the old theory has been revived by writers of some authority, other noted men have argued and maintained the partial character of the flood from the absence of all record of a deluge among the black races of the world, as the negroes and Papuans, asserting that this opinion is quite consistent with the exegesis of Scripture, with tradition, and the doctrine of the Church, while it is the only theory that avoids all the ethnological and linguistic difficulties presented by the existence of the great negro and yellow races marked off so distinctly from the Noachian type. The deluge traditions of many primitive races are connected with religious mysteries, and it is scarcely true, as has often been asserted, that it is the Old Testament alone that gives a moral reason for the deluge sent upon the world. The Chaldean account discovered by Georgė Smith presents a striking resemblance to the Genesis story, and agrees with it also in making the flood distinctly a divine retribution for human sin, although it of course differs from the Jewish account in being polytheistic instead of monotheistic. The vessel in which Xisuthros, the Chaldean Noah, sails, is a ship guided by a steersman, and others beside his own family are admitted into it. The flood is seven days at its height, and Xisuthros sends out in succession a dove, a swallow, and a raven. The ship finally rests on Rowandiz, the highest mountain of eastern Kurdistan, and the peak which supports the heavens, instead of upon Ararat, the northern or Armenian continuation of the range. Babylonian tradition also confounds Noah with Enoch, for Xisuthros is taken to the skies immediately after coming out of the ark. Two deluge poems were amalgamated together in an Akkadian epic, in 12 books, describing the adventures of Gizdhubar.

Bibliography.— Buckland, 'Reliquiæ Diluvianæ'; Howorth, 'The Mammoth and the Flood'; Lenormant, 'Histoire Ancienne de l'Orient'; Motais, 'Le Déluge Biblique.' Compare: Sayce, 'Fresh Light from the Ancient Monuments'; Prestwitch, 'On Certain Phenomena Belonging to the Close of the Last Geological Period.'

Deluge Tablet, or **Deluge Tablets,** the name given to the tablet or tablets (the 11th of the Izdubar Legends) inscribed with cuneiform writing, which being translated is found to contain the Chaldean account of the deluge. Perhaps it may have been originally Acadian. A paper on the subject was read by George Smith, of the British Museum, before the Society of Biblical Archæology, on 3 Dec. 1872, and a revised translation published in 1874. What Mr. Smith called the Flood-hero was Adra-hasis. In Babylonian proper names compounded of two elements, either might at pleasure be placed first.

Reversing the relative positions of the two elements, the name becomes Hasis-adra, which being imperfectly heard by the Greeks was by them written Xithurus or Xisuthrus.

Delun'dung (native name), the linsang or weasel-cat (*Prionodon gracilis*), a small quadruped inhabiting the vast forests of the eastern extremities of Java and Malacca. It is of pale yellowish-white color, with elegantly marked stripes and bands of a deep brown. It is allied to the civets, but is destitute of a scent-pouch.

Delusions. A delusion is a mental state in which the mind, reasoning from definite facts, arrives at erroneous, undemonstrable, and perhaps foolish conclusions, and is unable to modify these conclusions, whatever proof may be brought to show their falsity. Thus a patient suffering from delusions may read into the actions of others ideas and conclusions relating to himself that have no basis in actual logic. Seeing several people on a corner, a man with persecutory delusions may infer that they are gathering to do him harm, or planning to deprive him of his liberty, etc. See INSANITY.

Delyannis, dĕl-ĭ-ăn'ĭs, **Theodoros,** Greek statesman; b. Kalavryta, Peloponnesus, 1826; d. Athens 13 June 1905. He entered politics early in life and in his long career held many cabinet positions. While prime minister for the third time, 1895–7, he brought about the Græco-Turkish war, whose disastrous result obliged him to resign with his whole cabinet. He was stabbed by a professional gambler for the stringent measures taken by him against gambling houses.

Demades, dĕm-ā'dēz, Athenian orator: d. 318 B.C. Originally a fishmonger, he rose to high places in the republic. He was captured by Philip of Macedon in the battle of Chæronea, but soon set at liberty. He afterward exerted his influence in favor of the Macedonian party at Athens, but betraying Antipater, was put to death by Cassander, the son of the latter.

Dem'agogue (Gr. *demagogos*), one who leads or directs the people in political matters. In its original acceptation it was considered an honorable designation, and in this sense Pericles, Demosthenes, and Cicero were demagogues. On the other hand, the tanner, Cleon, satirized by Aristophanes in his play of the 'Knights,' is a portrait of the personage to whom the epithet in its bad sense is applied. It is a handy nickname to throw at a popular politician with whose views you have no sympathy. Usually an unprincipled orator or political agitator who curries popularity and power with the masses by pandering to their ignorance or prejudice.

Demand, a term in law, of comprehensive meaning. When referred to contracts it means a claim, a legal obligation. Its correlative is release, and a release of all demands is a release of all covenants real and personal, whether the conditions are broken or not, of all annuities, recognizances, obligations, and contracts. Demand, in the practice of law, is a requisition made by one individual to another to do a particular thing, namely, pay some debt, fulfil some contract, release some person or property. Demands are either express or implied. Sometimes an express demand is required before action can be taken, in other cases the law requires no more than the demand implied by bringing an action. Whether an express demand is required before a plaintiff can commence action to enforce fulfilment of a contract depends upon the express or implied stipulations of the parties to the contract. When no date is given in a contract for its fulfilment, whether in the case of a promissory note, or in the contracting of a debt, the payment of the obligation is due on the present day, or immediately on demand. It is requisite, in some cases arising *ex delicto,* that is, in some criminal cases, to make a demand for the restoration of the right before the commencement of an action, or, for instance, when the wife or other member of the plaintiff's household has been enticed away, in order to constitute the party a wilful wrongdoer, a demand for restoration must be made. When property lawfully obtained possession of is unlawfully detained, or converted, a demand for the delivery of its possession to the owner is requisite before an action can be laid. When an order to pay, or to do something has been made a rule of court, a demand for the payment of the money, or performance of the thing must be made before an attachment will be made for contempt. In like manner, before action can be taken for breach of promise of marriage, a demand for marriage must be made by the plaintiff, unless the defendant has married another person, or has refused to marry at any time. See CONTRACT; RECOGNIZANCES; RELEASE.

Demand and Supply, in political economy, the desire for services or utilities on the one hand, and the production or offer of them on the other, which tend to complete an act of exchange. Demand is commonly said to be relative to supply, but in reality it is reciprocal to it. Certain political economists qualify the term demand by the word effectual, but it is scarcely necessary to make such a limitation. A mere desire for objects has no commercial significance, but that desire simply which contemplates a mutual benefit. Thus the wish of a beggar to possess a diamond cannot affect the price of the article, as he can offer no desirable object in return. The intensity of demand, and the consequent effect upon values, will be proportionate to the necessity which exists for satisfying the demand. Different rules, therefore, will apply to the increase of price consequent upon increased demand and reduced supply in articles of voluntary use, and to the same rise in price when affecting articles of necessary use. The demand for the latter class of utilities is constant, and a deficiency in supply cannot be met by abstinence, except to a scarcely appreciable degree, whereas any considerable deficiency in the supply of articles of voluntary use is to some extent met by economy. Prices will, therefore, increase in different ratios according to the degree in which the commodities demanded are necessary or convenient. Thus the price of grain may rise, in the case of a bad harvest, from 50 to 100 per cent; cotton or wool, in similar circumstances, would certainly fluctuate, but not to anything like the same extent; wine would vary in price least of all; the deficiency in the last two commodities being artificially restored by the decrease of demand consequent on economy and abstinence. See POLITICAL ECONOMY.

Demar'atus, Spartan king. He succeeded his presumed father, Ariston, about 516 B.C.; but lost the throne, partly in consequence of a quarrel with his colleague, Cleomenes, and partly

on account of doubts which had been cast upon his real parentage. He retired into private life; but having afterward become a magistrate, was sitting in that capacity at the Gymnopædian games when Leotychides, who had supplanted him as king, sent tauntingly to ask him how he felt in a secondary place after having occupied the first. The boldness of his reply forced him to take flight, and he passed over into Asia, where he was well received by Darius. He afterward accompanied Xerxes on his expedition against Greece, and is said to have given counsel which, if listened to, would probably have made the issue of it very different from what it eventually proved.

Demarcation, Line of, the boundary established 4 May 1493 by Pope Alexander VI., who assigned to Spain all the lands she had discovered or might discover west of a line running from the North pole to the South, distant 100 leagues west of "any of the" Azores and Cape Verde Islands (provided such lands had not been in the actual possession of any other Christian king or prince up to the preceding Christmas), and to Portugal, on the same conditions, all the territory she had discovered or might discover east of the said line. The governments of the peninsula held that the Pope had sole and absolute authority to dispose of all countries inhabited by heathen peoples; moreover the papal bull *inter cætcra* of 4 May 1493, under penalty of excommunication, forbade all persons without special permit to go "for the purpose of trade or any other reason" to the islands and mainlands thus granted exclusively to Spain and Portugal. After this territorial concession had been made, Portugal's possessions in the eastern hemisphere were called the East Indies, and those of Spain in the western hemisphere were called the West Indies. An extension of the papal gift of the Indies was made in the bull dated 25 Sept. 1493. A dispute arising in regard to the position of the line of demarcation, the two countries concerned sent commissioners to the Spanish city of Tordesillas, and on 7 June 1494 the commissioners agreed that the line should pass, north and south, 370 leagues west of the Cape Verde Islands. On the strength of this agreement, Portugal claimed and secured the eastern part of South America (see Brazil). After the Victoria returned to Seville (1522) from her voyage to the Moluccas, and so round the world, the Portuguese accused their rivals of having broken the treaty of Tordesillas. The Spaniards in reply said that the Spice Islands (Moluccas) were not within the limits of the Portuguese territory. To settle this important dispute, a congress was convened at Badajos in 1524. Commissioners of both countries were in attendance — Fernando Columbus, Sebastian Cabot, and others. The two main points to be decided were: (1) whether the line of demarcation should be drawn at the stated distance west of the western or eastern limit of the Cape Verde Islands; and (2) where it would pass on the opposite side of the earth. This Badajos junta failed to come to an agreement "owing to the Portuguese experts, who could not overcome this dilemma: If the line was pushed more to the west, Portugal would gain a greater part of Brazil; but she might lose all rights over the Moluccas, as the line, of course, had to be carried to the other hemisphere as well." The treaty of Vitoria, signed 19 Feb. 1524, provided that, inasmuch as some doubt existed between the sovereigns of Castile and the king of Portugal as to the possession and ownership of the Moluccas, there should be appointed by each one of the parties to the treaty "three astrologers and three pilots, and sailors, for the determination of the demarcation." A treaty negotiated at Saragossa and signed by representatives of the Spanish and Portuguese monarchs 22 April 1529 fixed the line of demarcation 297½ leagues east of the Moluccas, Spain selling for a stated sum whatever rights she had formerly claimed to possess in the Spice Islands, and agreeing for the future practically not to colonize, and expressly not to "trade there in any manner whatsoever." It did not seem necessary at that time to raise the question as to the location of the line in the New World, though it is plain that if the circle thus "determined from pole to pole" in the east had been logically completed, Portugal would have been excluded from the South American continent. The bearing of this matter upon Spanish rights in the Philippines is of special interest. The Molucca Islands, the Philippines, and, indeed, the western half of Australia lay within the Portuguese assignment, as a matter of fact. Therefore the principal Spanish settlements and explorations in the Far East appear to have been made in contravention of Portugal's treaty rights.

Consult: Blair and Robertson, 'The Philippine Islands,' Vol. I.; Harrisse, 'The Diplomatic History of America'; Dawson, 'The Line of Demarcation of Pope Alexander, etc. . . . with an inquiry concerning the Metrology of Ancient and Mediæval Times,' in Proceedings of Royal Society of Canada, 1899.

Marrion Wilcox.

Demavend, dĕm-a-vĕnd′, a volcanic mountain, now extinct, of Persia, and the highest peak of the Elbruz chain, 45 miles south of the Caspian Sea, and about 40 miles northeast of Teheran. Its height, according to the most reliable measurement, is 18,464 feet. At a distance the mountain has the form of a smooth cone, and appears to slope evenly from top to bottom at an angle of 45°. The cone terminates in a crater of 85 yards in diameter, and nearly surrounded by jagged rocks, composed partly of basalt and partly of limestone and sulphur. This sulphur is an article of commerce. The basin within is almost entirely filled with snow. Around the base are many hot springs. William T. Thompson was the first European to ascend Demavend (1837).

Dembea, dĕm′bē-a or dĕm-bē′a, or **Tzana,** a lake of Abyssinia, in the western part of the country. It is about 50 miles long and 6,000 feet above the level of the sea. It contains many islands, one of which is a place of confinement for state prisoners. The Bahr-el-Azrek, the Abyssinian Nile, flows through it.

Dembinski, dĕm-bēn′skē, **Henryk,** Polish general: b. Strzalkow, near Cracow, 3 May 1791; d. Paris 13 June 1864. In the year 1825 he became a member of the Polish diet, where he cast in his lot with the opposition party. On the outbreak of the revolution in that country (1830), he was made brigadier-general, and in the following year was nominated governor of Warsaw and commander-in-chief of the Polish army. On the fall of Warsaw in September

into the hands of the Russians, Dembinski made his escape. The Hungarian revolution of 1849 once more offered him a field for his activity, and he was appointed by Kossuth commander of the insurgent troops. He had the misfortune to lose the battle of Kapolna, and resigned his command, but consented to act under Görgei. After the capitulation signed by the latter at Villagos, and the resignation of Kossuth, Dembinski fled to Turkey.

Deme, dēm, a subdivision of ancient Attica and of modern Greece. The démoi were townships or hundreds, subdivisions of the phulai, and were equivalent to the Dorian *komai*, Latin *pagi*. The word really meant a country district, or a common name for divisions of the country, and in the time of Herodotus they were 100 in number in Attica (10 in each phulē), afterward 170; their origin was commonly referred to Theseus. The word dēmos early came to be applied to the commons, and survives significantly in our democracy and demagogue.

Demen'tia, a mental condition in which there is a breaking down or weakness of what originally was a competent mind. Dementia is usually a secondary condition, although primary and secondary forms are distinguished by alienists. Primary or acute dementia usually follows some violent physical or mental shock, which may paralyze the brain functions for a time or for life. Secondary dementias are those that follow other forms of the insanities, or are the result of senile changes. Acute primary dementia occurring in young adults is now spoken of as dementia præcox. The most characteristic symptoms are a somewhat vacant and expressionless face; confused memories, or loss of memory; excitement, which may alternate with periods of stupor; diminished sensibility to pain; loss of desire to eat, or else gluttony; incoherent thinking; stumbling, or muttering speech, or speechlessness; lowered reflexes, etc. Some patients may recover partially, but the usual history is that they remain permanently demented and pass into secondary demented states. Chronic dementias, it has been said, usually follow attacks of mental disease, which, as Maudsley says, "instead of passing away in their due season and leaving a clear mind, lapse by quick or slow steps of degeneration into terminal dementia. Comparative peace remains then, but it is the peace of a desert." Alcoholism, epilepsy, apoplexy, and nutritional changes all bring about chronic dementia. See INSANITY.

Demerara, dĕm-ĕ-rä'ra, **The District of,** one of the three parts into which British Guiana is divided. In the uplands coffee is produced, and in the lowlands sugarcane and rice; these being the principal articles of exportation. The capital of this district and of the colony as well is Georgetown, which sometimes is also called Demerara.

Demerara River, British Guiana, rises in the unexplored mountains of the interior, flows northward, and empties into the Atlantic at Georgetown. It is navigable for small vessels to a point about 150 miles above its mouth. The estuary of the Demerara forms a moderately good harbor. See GEORGETOWN.

Demesne, dē-mēn', or **Domain** (in French *domaine*), in its popular sense, denotes, under a feudal aristocracy, the lord's domain, his manor place, with the lands thereto belonging. In England the demesne of the crown denotes either the share reserved to the crown in the distribution of landed property at the time of the Conquest, or such as came to it afterward, by forfeitures or other means. They are at present contracted within a very narrow compass, having been almost entirely granted to private subjects. The rents and profits of the demesne lands of the British crown are no longer kept separate, but are incorporated with the ordinary revenue. See CIVIL LIST.

The alienation of the domains in France, rendered necessary to reward powerful supporters, was the main cause of the fall of the Carlovingian dynasty. The succession of the Capets was likewise due to their great possessions, which rendered them the most powerful nobles in France. The policy of this house, particularly of Louis XI. of the Valois branch, in despoiling the great nobles, made them at length absolute masters of the kingdom, although at first their authority, beyond their own domains, was very feeble. The despotic power of the French monarchy reached its climax under Louis XIV., the most powerful of the Bourbon branch of the family. The nobility had now lost nearly all its feudal privileges, and could easily be rewarded by places at court, appointments in the public services, and pensions out of the national revenue. Napoleon, who endeavored as much as possible to revive the traditions and institutions of the monarchy, had also a *domaine extraordinaire* (law of 30 Jan. 1810), which consisted of his acquisitions by conquests, and were kept entirely at his disposal; these supplied the means of donations to his generals, etc. The *domaine extraordinaire* was likewise retained by the Bourbons (law of 22 May 1816). The administration of these donations was conducted with great wisdom; and Napoleon, as Las Casas relates, dwelt with pleasure on this branch of his government.

Demeter, dĕ-mē'tĕr, one of the twelve principal Grecian deities, the great mother-goddess, the nourishing and fertilizing principle of nature. She was the daughter of Cronos and Rhea, and mother of Persephone (often called Cora, the Maiden, the Proserpine of Roman mythology), and according to Hesiod, of Dionysus (Bacchus). By later writers Demeter is represented as being the wife of Dionysus. The main feature in the mythus of Demeter, and that which forms the fundamental idea of her worship, is the loss and recovery of her daughter, Persephone. Zeus, without the knowledge of Demeter, had promised Persephone to Pluto, who carried her off as the earth opened in a field where Zeus had caused some flowers to grow to tempt the unsuspecting maid. Her mother, who heard the echo of her cries, but did not see who had carried her away, sought for her in vain over the earth, till Helios told her that Pluto had carried her off with the connivance of Zeus. Demeter vowed never to return to Olympus until her daughter accompanied her. Zeus sent first Iris, and then all the gods, to implore her to return, but without success; at last, fearing lest the race of mortals should perish, she having afflicted the earth with sterility, he despatched Hermes to Erebus to bring back Persephone. Pluto consented to her return, but gave her a pomegranate, and she

having eaten of the fruit of Erebus, was compelled thenceforth to spend a part of every year in the infernal regions. Hermes conducted her to her mother at Eleusis, and Zeus sent Rhea to urge Demeter to revisit Olympus, and tell her that he had consented that Persephone should remain two thirds of the year with her mother, the remaining third (the winter season) being passed with Pluto. Demeter now consented to return and to restore fertility to the earth; but before departing from Eleusis, which she had made her abode, she taught Triptolemus how her worship was to be conducted, and initiated him into the mysteries of the Eleusinia. In ancient monuments Demeter is represented as a beautiful matronly woman, with a mild and benevolent expression of face; she is always enveloped with ample drapery, which is usually close up to the neck; sometimes, however, one of her breasts is left exposed. Prof. Max-Müller identifies her with the Sanskrit *Dyâr Mâtar* (the Dawn). By the Romans she was identified and worshipped with Ceres (q.v.).

Demeter, Dimitrija, dē-mē-trē'zhä dē-mē'-tėr, Croatian dramatist and poet: b. Agram 21 July 1811; d. there 24 June 1872. His principal dramas are: 'Love and Duty'; 'Blood-Revenge'; and the tragedy 'Teuta.' He wrote a lyro-epic poem, 'The Battlefield of Grobnik,' and several stories. He translated several foreign dramatic works into Croatian.

Deme'trius I., surnamed **Poliorcetes,** king of Macedonia: d. Pella, Syria, 284 B.C. He appeared before Athens with a fleet, and restored to the people their ancient form of government (307 B.C.). Having lost the battle of Ipsus against Seleucus, Cassander, and Lysimachus (301 B.C.), he fled to Ephesus, and passing over to Corinth, embarked on an expedition against the Thracian dominions of Lysimachus. He then went to Asia, to bestow his daughter Stratonice in marriage on Seleucus, and on his way took possession of Cilicia, by which his friendship with Seleucus was broken off. He conquered Macedonia (294 B.C.), and reigned seven years, but lost this country by his arbitrary conduct.

Demetrius II. (called "Nicator"), king of Syria: d. 126 B.C. Ptolemy Philometer, king of Egypt, placed him on the throne of his father, after expelling the usurper, Alexander Balas, 146 B.C. He married Cleopatra, the wife of the same Alexander, and daughter of Ptolemy.

Demetrius, or **Dmitri,** a series of impostors who usurped supreme authority in Russia, and led to some of its remarkable revolutions. Ivan Wasiliewitch, who had put his eldest son to death, left the throne in 1584 to another son, Fedor, whom Boris Godunow entirely supplanted in his authority. Ivan had left another son, Dmitri, by a second marriage; and Boris, fearing that he might one day prove a formidable obstacle to his ambitious projects, made away with him, but no one exactly knew how. Shortly after, in 1598, Fedor died, and Boris took possession of the throne. Mystery still hung over the fate of Dmitri, and Grishka, or Gregory Otrepieff, determined to turn it to account. Several persons had been struck with his resemblance to Dmitri, and he at once explained the fact by declaring that he was Dmitri indeed, and that the design of Boris to murder him had been frustrated. The report quickly spread, and Otrepieff fled into Poland, where Sigismund III., king of Poland, who saw in him a useful instrument for introducing Polish influence into Russia, aided him to enter that kingdom at the head of a body of troops. Boris was deserted by his soldiers, and ended his life by poison. Otrepieff in 1605 entered Moscow in triumph, and, as the genuine son of Ivan, was proclaimed grand duke of Russia. He was now firmly seated on the throne, and might have transmitted it to his descendants had he governed with prudence. Conspirators, after exciting a tumult, forced their way into the palace and put the false Dmitri to death. His body was exposed to public view, but in such a state that its features could not be recognized; and a rumor of his being still alive having spread, another impostor quickly appeared to personify him. The Poles espoused the cause of the second false Dmitri, and had made it triumphant, when he was assassinated in 1610 by the Tartars whom he had selected as his body guards. A state of anarchy ensued, and continued for nearly half a century, during which a number of other false Dmitri appeared in different quarters.

Demetrius Phalereus, fa-lē'rē-ŭs, Greek orator. He was made Macedonian governor of Athens, and archon (309 B.C.), and embellished the city by magnificent edifices. The gratitude of the Athenians, over whom he ruled, erected him as many statues as there are days in the year, but these were afterward scornfully broken, and he himself condemned to death by that fickle people. He fled to Egypt, where he is said to have promoted the establishment of the Alexandrian Library, and of the museum, the superintendence of which Ptolemy Lagus entrusted to him. Under Ptolemy Philadelphus, he fell into disgrace, and was banished to a remote fortress, where he died from the bite of an asp. Demetrius was among the most learned of the Peripatetics, and wrote on several subjects of philosophical and political science. But the work on rhetoric, under his name, belongs to a later age.

Demetz, dė-mās, **Frédéric Auguste,** French philanthropist and prison reformer: b. Paris 12 May 1796; d. there 22 Nov. 1872. He was judge, vice-president of the chamber of correctional police, and court councilor. He founded in 1840, the penitential and agricultural colony of Mettray for juvenile delinquents, devoting himself wholly to this establishment, which has served as a model in France and elsewhere. He was elected corresponding member of the Academy of Moral and Political Sciences, Paris, in 1864. He wrote many essays and reports upon penitentiary methods and reforms.

Demi Lune (same as ravelin), in fortification, is a work constructed to cover or protect the curtain or wall of a place, and the shoulders of the neighboring bastions. It is composed of two faces forming a salient angle toward the open country outside the place. It has two demi-gorges formed near the counterscarp, and is surrounded by a ditch.

Demi-monde, dĕm'ĭ-mônd, an expression first used by the younger Dumas in a drama of the same name (first performed in 1855), to denote that class of gay female adventurers who differ from honest women in being the objects of public scandal, and from courtesans by their non-venality. When the word is used elsewhere

than in France the last-mentioned difference is seldom kept in mind.

Demi-relief, or **demi-rilievo,** rĕ-lēf′vō, a term applied to sculpture projecting moderately from the face of a wall; half raised, as if cut in two, and half only fixed to the plane. Mezzo-rilievo, which is the more correct term used to designate this style of sculpture, is lower than alto-rilievo and higher than basso-rilievo.

Demidoff, dĕm′ē-dŏf, or **Demidov,** a noble Russian family, whose head, Nilka Demidoff, was an armory-founder at Toula. This Demidoff was intrusted by Peter the Great with the business of casting the cannon for that prince's numerous warlike expeditions. He actively seconded all the exertions of the czar, and in 1725 discovered the mines of Kolyvan, the working of which speedily enriched him. He left a son, Nitika, and several grandsons, who distinguished themselves in the same career as their progenitor, and amassed colossal fortunes. The best known of these are Prokop Demidoff, who worked with great profit the iron, copper, and gold mines of the Ural Mountains; Nikolai Nikitich (about 1773–1828), a zealous philanthropist, who introduced into his country several branches of industry, founded establishments of public utility, and carried to a great state of perfection the working of mines. He had an annual income of more than $1,000,000. His last years he passed in France and Italy, enjoying the society of learned men, and heaping benefits on all around him. He left two sons, Paul and Anatole (1812–70), who, as well as inheriting his fortune, had also the same high taste and benevolence.

Demijohn, a jug in a wickerwork casing or box. The name naturally suggests "half-John," or somebody or something directly or indirectly connected with some "John" and liquor. But demijohns are used for holding all sorts of liquors — not necessarily intoxicants.

The origin of the word is uncertain. We get it from the French "damejeanne," which signifies a "demijohn," just as in our language. And that word appears to have been originally a corruption of "Dame Jeanne," or Lady Jane — or else to have gone into the French tongue directly from the Arabic "damagan" (a demijohn), said to be so called from Damagan, a town in Khorasan, a northern province in Persia, once famous for its glass-works, and to have been the spot where glass jugs enclosed in wickerwork were originally made.

The demijohns themselves are a most important article in the liquor, oil, drug and paint trades, not to mention other branches generally not so well known. The largest demijohn regularly made for the trade has a capacity of five gallons. The smallest holds 1½ ounces, or less than a gill. This size is used chiefly for perfumery and cordials. Between the five-gallon and the gill size demijohns are made in many sizes, including quarts, pints and half-pints. Demijohns are not very costly, but the very smallest are the most expensive proportionately. A gill demijohn sells for more than one that will hold half a gallon, the reason being that the little ones must be covered and finished with great care, while in the larger sizes the chief thing required is serviceability. For the basket work on the smaller demijohns takes more time and costs more for labor than a demijohn some sizes larger. Demijohns are used for many purposes. They are filled with vinegar, molasses, perfumery, bay rum, cordials, extracts, essences and for various waters. Almost all the demijohns used in America are made here, though some are imported from Germany and France. Before sending them to this country they pack their big demijohns in cork scraps, or shredded sponges for their protection and transportation. Our big five-gallon demijohns are made in the form of box-demijohns, the bottle being incased not in wickerwork, but in a box, or a wooden crate. Sometimes smaller ones are made in this way. The big demijohns are known as carboys and are regularly employed to transport chemicals.

De Mille, Henry Churchill, American playwright: b. North Carolina about 1853; d. Pompton, N. J., 10 Feb. 1893. He was graduated at Columbia College, and was by turns preacher and teacher till 1882, when he became examiner of plays at the Madison Square Theatre, and later for a short time an actor. His first successful play was the 'Main Line,' in which he collaborated with Charles Barnard. In 1887, having become associated with David Belasco, he wrote the well-known society dramas: 'The Wife' (1887); 'Lord Chumley' (1888); 'The Charity Ball' (1889); 'Men and Women' (1890). His last work was a melodrama adapted from the German, entitled 'Lost Paradise,' which was successfully produced in 1892.

De Mille, James, Canadian novelist: b. St. John, N. B., Aug. 1837; d. Halifax, N. S., 28 Jan. 1880. Graduated at Brown College in 1854. He was professor of classics in Acadia College (1860–5), and of history and rhetoric in Dalhousie College, Halifax, from 1865 until his death. Among his publications are: 'The Dodge Club' (1866); 'Cord and Creese' (1867); 'A Comedy of Terrors' (1872); 'The Living Link' (1874); and many books for boys, including 'Treasures of the Sea.' A posthumous work, 'A Strange Manuscript Found in a Copper Cylinder,' appeared in 1888. A treatise of his on rhetoric was published in 1878.

Deming, Clarence, American journalist: b. Litchfield, Conn., 1 Oct. 1848. He was graduated at Yale College 1872; was assistant editor of the Troy *Whig,* 1872–3, and served as night editor of the New Haven *Palladium* 1874–5. He was on the staff of the New York *Evening Post* 1874-84, and was afterward for several years editor of the New Haven *News.* He is the author of 'By Ways of Nature and Life.'

Deming, Philander, American lawyer and author: b. Carlisle, N. Y., 6 Feb. 1839. He was graduated at the University of Vermont 1861, and at the Albany Law School. From 1878-9 he was president of the New York State Law Stenographers' Association. He began to write stories for the magazines in 1873, and his published books include 'Adirondack Stories'; 'Tompkins and Other Folks.'

Demise, dē-mīz′ (literally, a "laying down"), a grant by lease; it is applied to an estate either in fee-simple, or for a term of life or years. The word demise in a lease implies an absolute covenant on the part of the lessor for the lessee's peaceable enjoyment during the term. As applied to the crown of England, demise signifies its transmission to the next heir on being laid down by the sovereign. "So tender

is the law of supposing even a possibility of the sovereign's death, that his natural dissolution is called his demise, an expression which merely signifies a transfer of property» (Blackstone).

Demisemiquaver, in musical notation it is half a semiquaver (sixteenth note), or the thirty-second part of a semibreve (whole note). When written as a note or rest it has three little crooks or bars appended to the stem.

Demiurge, dĕm'ĭ-ėrj (Greek, *demiourgos,* «a handicraftsman»), designation applied by Plato and other philosophers to the Divine Being, considered as the Architect or Creator of the universe. The Gnostics made a distinction between the Demiurge and the Supreme Being; with them the first is the Jehovah of the Jews, who, though deserving to be honored as the Creator, was only the instrument of the Most High. He was also called Archon and Son of Chaos, chief of the lowest order of spirits or eons of the Pleroma. He corresponds to the Logos or Word of St. John.

In some of the Peloponnesian states of ancient Greece the name Demiurge seems to have been given to a chief magistrate, probably corresponding to the Roman tribune. The origin of evil was sometimes attributed to the Demiurge.

Democe'des, Greek physician: b. Crotona about 550 B.C.; d. 504 B.C. He was for a time physician to Polycrates, tyrant of Samos; was taken prisoner by the Persians and rose to a position of considerable influence at the court of Darius I. through his medical skill. He persuaded the king to send him with others on a secret mission to Greece, but escaped from his companions and fled to Crotona.

Democracy (Gr. *δημοκρατία* = *δῆμος,* the people, and *κράτος,* power), a form of government in which the people, either directly or through their representatives, are supreme; according to Lincoln's definition, a government of the people, by the people, for the people. A pure democracy was for many centuries the dream of political idealists, because it meant liberty with the full power of self-development to the individual. The Greeks were the first people who tried to realize the democratic ideal. Aristotle enumerates among the three possible forms of government the monarchy, the oligarchy, and the democracy. The monarchy however may be a despotism, like that of Russia; a monarchy, like that of Germany overruling by the power of the army the will of chancellor or prime minister and parliament, and claiming the divine right of kings; or a limited monarchy, like that of England, in the history of which the parliament has more than once proved itself paramount. The oligarchy, the supremacy of a small class, may be based on hereditary rank, or property qualifications. The democracy may be mixed and partial, as when it tolerates the existence of slaves in its territory, as Athens did; or it may degenerate into ochlocracy, mob government, as in the early days of the French republic, whose counsels were swayed alternately by the power of a sort of oligarchical minority, and the stormy and fluctuating passions of the mob. More important is the distinction in a democracy between direct and indirect representation. The Athenian democracy professed to establish direct representation of the demos. In the agora or place of legislative assembly everyone but slaves might speak and vote. Such was the theory, but as a matter of fact only 1 in 40 was qualified to vote out of a population of more than half a million. Nor can it be forgotten that direct representation in the agora, or parliament of Athens, was practically limited to the city of Athens; not even the whole territory of Attica was represented there, much less the Athenian islands and dependencies. Even at Athens, the importance of the masses was never recognized. The main power was aristocratic, and the conflicts of the agora exhibited the people swayed hither and thither by speeches of men like Pericles and Alcibiades, or lashed into fury by plebeian Cleon in his vain attempt to break through the phalanx of aristocratic exclusiveness. The Roman republic was not a democracy in the sense of giving full voice to the will of the people; its republicanism consisted in a hatred for the name of king. The essence of a democracy lies in the abolition of institutions which shall give constitutional permanence to class distinctions. In the light of this principle it will plainly be seen that the mediæval communes or republics of Italy fell very far short of being democratic in their character. Here we may point out how much confusion there exists in men's minds in distinguishing between political and social democracy, between the democracy of laws and the democracy of sentiment and manners. The principle of the legal and political equality of men is not inconsistent with the utmost variety of natural and social distinctions. It only forbids the creation by law of artificial distinctions. The example of the American people shows that democratic political institutions are compatible with very great inequalities in cultivation, manners, style of living, social consideration and the distribution of property.

Modern democracy, as we now see it, is the result of a gradual process of development continued through centuries amidst the severest struggles. Such struggle will appear to be inevitable, when we consider that democracies have grown up in large states in which absolutism formerly prevailed, and in which the military system prevails even yet. Among the decisive steps in the modern struggle of the people against the old classes and systems should be noted the long contest of the Dutch against Spain, the great English revolutions of 1642 and 1688, the war of American Independence in 1776, the great French Revolution of 1789, and the revolutionary periods of 1830 and 1848. The English revolutions of 1642 and 1688 established parliamentary rule in England, though on a narrow basis. Yet they had the important result of proving the fitness of a new type of government, which further became a model for similar institutions in other countries. The greatest event in the evolution of democracy, however, was the French Revolution of 1789; though it failed for the time, it shook the old system to its foundations; it everywhere spread new ideas, and raised questions that could not again be set aside. The revolution of 1830 showed that the reactionary conditions prevalent after Waterloo had no claim to permanency. The revolutionary movements of 1848, which affected France, Italy, Austria and Germany, were apparently a failure, yet they overthrew what remained of the feudal system in western and central Europe. But the most significant thing connected with that period is the fact that

only a few years afterward universal suffrage was introduced in all the countries where its influence had been felt. Governments which had been most active in suppressing the revolution found it expedient to adopt its cardinal principles. The fundamental basis of democracy is the recognition of the rights of man as man. Its central principle is the equality of all men before the law, without regard to birth, property, or social rank; from which principle is deduced the right of all men to an equal voice or vote in deciding upon public affairs, or in selecting agents and representatives to perform the functions of legislation and to execute the laws. The principles of democracy are forcibly and clearly stated in the American Declaration of Independence, in the words of Thomas Jefferson, who has been called "the apostle of democracy": "We hold these truths to be self-evident; that all men are created equal; that they are endowed by their Creator with certain inalienable rights; that among these are life, liberty, and the pursuit of happiness. That, to secure these rights, governments are instituted among men, deriving their just powers from the consent of the governed." These principles are still more fully developed in the constitutions of the States of the Union. The constitution of New Hampshire (1792) says: "All men are born equally free and independent; therefore all government of right originates from the people. All power residing originally in and being derived from the people, all the magistrates and officers of the government are their substitutes and agents, and at all times accountable to them." These principles are enunciated with equal clearness in the Constitutions of other States of the Union. It is as representing these principles that the government of the United States, as also of the several States that constitute the Union, is democratic in fullest sense of the term.

As we have seen, the distinctive features of the modern democracy are the widest personal freedom, by which each man has the liberty and responsibility of shaping his own career; equality before the law; and political power in the form of universal suffrage, exercised through the representative system. With these are associated universal education, and on the continent of Europe universal liability to military service. In Great Britain and the United States universal liability to military service exists also in theory as regards the militia. On the European continent it is a momentous fact imposed upon its peoples by the necessities of the struggle for existence, which the moral development of mankind has not yet been able so to regulate as to put an end to war. Anglo-Saxon countries are happily freer from such necessities. It is an interesting fact, however, that Prussia, which was the first great nation to adopt universal education, was also the first to introduce universal military service.

It is important to remember that the growth of the modern democracy has gone hand in hand with the general development of the most advanced nations of the world. The consolidation of the political power of the people is the result of far-reaching causes operating on a great scale throughout the history of modern nations. The growth of the democracy is intimately connected with the growth of every other factor in the social life. For example, the different stages in the rise of the democracy could be paralleled by the improvements in the art of printing. The development of the democracy has on the one hand created the demand for cheap literature and cheap newspapers, but it has also on the other hand depended on the supply of them. Further, the growth of the cheap newspaper and of cheap literature depends on the industrial development, on the improvement of our technical capacities and resources, on man's growing mastery over nature. To the production of the daily newspaper a thousand technical appliances are subsidiary. Steam and electricity are the great forces that move the vast mechanism on which society is now based. In fact the growth of the democracy is intimately connected with an industrial and technical development which has culminated in the railway, the penny post, the electric telegraph, and the steam printing-press. The peculiar influence of the human voice has not been superseded, yet it is chiefly through the telegraph and the printing-press that the modern democracy obtains the education which the ancient democracy received in their popular assemblies and in the daily intercourse of the market-place.

Democratic Party, The, one of the chief political organizations in the United States. To Thomas Jefferson belongs the honor of being the founder, and for a third of a century the undisputed leader, of the Democratic party. Scarcely had the present Constitution been adopted before there appeared a line more or less distinct dividing those who, like Jefferson (q.v.), believed the people fully capable of self-government and trusted them, and those who, like Hamilton (q.v.), thought that the masses needed to be under the control of a strong and centralized government. This fundamental difference of opinion manifested itself in the treatment of every important question, and party organizations were soon perfected.

As Jefferson himself has described the birth of parties in the United States, his opinion can be accepted as authoritative. In a letter written in June 1823, near the close of his life, to William Johnson, he said:

> At the formation of our government, many had formed their political opinions on European writings and practices, believing the experience of old countries, and especially of England abusive as it was, to be a safer guide than mere theory. The doctrines of Europe were that men in numerous associations cannot be restrained within the limits of order and justice, but by forces physical and moral, wielded over them by authorities independent of their will. Hence their organization of kings, hereditary nobles, and priests. Still further to constrain the brute force of the people, they deem it necessary to keep them down by hard labor, poverty and ignorance, and to take from them as from bees, so much of their earnings, as that unremitting labor shall be necessary to obtain a sufficient surplus barely to sustain a scanty and miserable life. And these earnings they apply to maintain their privileged orders in splendor and idleness, to fascinate the eyes of the people, and excite in them an humble adoration and submission, as to an order of superior beings. Although few among us had gone all these lengths of opinion, yet many had advanced, some more, some less, on the way. And in the convention which formed our government, they endeavored to draw the cords of power as tight as they could obtain them, to lessen the dependence of the general functionaries on their constituents, to subject to them those of the States, and to weaken their means of maintaining the steady equilibrium which the majority of the convention had deemed salutary for both branches, general and local. To recover, therefore, in practice the powers which the nation had refused and to warp to their own wishes those actually given, was the steady object of the Federal party.

Ours, on the contrary, was to maintain the will of the majority of the convention and of the people themselves. We believed, with them, that man was a rational animal endowed by nature with rights and with an innate sense of justice; and that he could be restrained from wrong and protected in right, by moderate powers confided to persons of his own choice, and held to their duties by dependence on his own will. We believe that the complicated organization of kings, nobles, and priests, was not the wisest nor best to effect the happiness of associated man; that wisdom and virtue were not hereditary; that the trappings of such a machinery, consumed by their expense, those earnings of industry they were meant to protect, and, by the inequalities they produced, exposed liberty to sufferance. We believe that men, enjoying in ease and security the full fruits of their own industry, enlisted by all their interests on the side of law and order habituated to think of themselves and to folow their reason as their guide, would be more easily and safely governed, than with minds nourished in error and vitiated and debased, as in Europe, by ignorance indigence, and oppression. The cherishment of the people then was our principle, the fear and distrust of them that of the other party. Composed, as we were, of the landed and laboring interests of the country, we could not be less anxious for a government of law and order than were the inhabitants of the cities, the strongholds of federalism. And whether our efforts to save the principles and form of our Constitution have not been salutary, let the present republican freedom, order, and prosperity of our country determine.

Jefferson not only gave a history of the formation of parties, but fortunately for later generations, he enumerated the elements which each party contained. In a letter to C. E. Ebeling in 1795 he said:

Two parties exist within the United States. They embrace respectively the following descriptions of persons. The Anti-Republicans consist of: (1) The old refugees and Tories; (2) British merchants residing among us, and composing the main body of our merchants; (3) American merchants trading on British capital, another great portion; (4) speculators and holders in the banks and public funds; (5) officers of the Federal government with some exceptions; (6) office hunters willing to give up principles for places,—a numerous and noisy tribe; (7) nervous persons, whose languid fibres have more analogy with a passive than active state of things. The Republican party of our Union comprehends: (1) The entire body of landholders throughout the United States; (2) the body of laborers not being landholders whether in husbanding or the arts. The latter is to the aggregate of the former party probably as 500 to 1; but their wealth is not as disproportionate, though it is also greatly superior and is in truth the foundation of that of their antagonists. Trifling as are the numbers of the Anti-Republican party, there are circumstances which give them an appearance of strength and numbers. They all live in cities together, and can act in a body and readily at all times; they give chief employment to the newspapers, and, therefore, have most of them under their command. The agricultural interests are dispersed over a great extent of country, have little means of intercommunication with each other, and feeling their own strength and will, are conscious that a single exertion of these will at any time crush the machinations against their government.

Jefferson's philosophical mind sought not only the facts, but the reason for the facts, and in 1824, in a letter to Mr. Lee he thus classified men according to their party tendencies:

Men by their constitutions are naturally divided into two parties: (1) Those who fear and distrust the people and wish to draw all powers from them into the hands of the higher classes; (2) those who identify themselves with the people, have confidence in them, cherish and consider them as the most wise depositary of the public interests. In every country these two parties exist, and in every one where they are free to think, speak, and write, they will declare themselves. Call them, therefore, liberals and serviles, Jacobins and ultras, Whigs and Tories, Republicans and Federalists, aristocrats and Democrats, or by whatever name you please, they are the same parties still, and pursue the same object. The last appellation of aristocrats and Democrats is the true one expressing the essence of all.

Jefferson's purpose was to found a party that would be really democratic in personnel, in purpose and in method. The party, however, was at first called the Republican party, and afterward the Democratic-Republican party. It was not until in Jackson's time that it became universally known by its present name. As there were no national conventions and no national platforms in the early days of the Republic the position of the party on public questions must be gathered from the words and speeches of the leaders and from the votes of the members of the party in Congress. Jefferson's first inaugural address contained the essence of the party creed as generally accepted during the first quarter of the 19th century. In fact, it is still the creed of the party, and no group of men desiring to maintain an influence in the party can even now admit any essential departure from it. It will be found below:

About to enter, fellow-citizens, on the exercise of duties which comprehend everything dear and valuable to you, it is proper you should understand what I deem the essential principles of our government, and consequently those which ought to shape its administration. I will compress them within the narrowest compass they will bear, stating the general principle, but not all its limitations. Equal and exact justice to all men, of whatever State or persuasion, religious or political; peace, commerce, and honest friendship with all nations, entangling alliances with none; the support of the State governments in all their rights, as the most competent administrations for our domestic concerns and the surest bulwarks against Anti-Republican tendencies; the preservation of the general government in its whole constitutional vigor, as the sheet anchor of our peace at home and safety abroad; a jealous care of the right of election by the people — a mild and safe corrective of abuses which are lopped by the sword of revolution where peaceable remedies are unprovided; absolute acquiescence in the decisions of the majority, the vital principle of republics, from which is no appeal but to force, the vital principle and immediate parent of despotism; a well-disciplined militia, our best reliance in peace and for the first moments of war, till regulars may relieve them; the supremacy of the civil over the military authority; economy in the public expense that labor may be lightly burthened; the honest payment of our debts and sacred preservation of the public faith; encouragement of agriculture, and of commerce as its handmaid; the diffusion of information and arraignment of all abuses at the bar of the public reason; freedom of religion, freedom of the press, and freedom of person under the protection of the *habeas corpus*, and trial by juries impartially selected. These principles form the bright constellation which has gone before us and guided our steps through an age of revolution and reformation. The wisdom of our sages and blood of our heroes have been devoted to their attainment. They should be the creed of our political faith, the text of civic instruction, the touchstone by which to try the services of those we trust; and should we wander from them in moments of error or of alarm, let us hasten to retrace our steps and to regain the road which alone leads to peace, liberty, and safety.

The first and most fundamental difference between the Democratic party (when it was known as the Republican party, afterward as the Democratic-Republican party, and to-day as the Democratic party) and the party which has opposed it (first known as the Federal party, then as the Whig party and more recently as the Republican party), was upon the construction of the Constitution. The former party has insisted upon a strict construction, while the latter

has leaned toward a liberal construction of the Federal constitution. This difference is a natural one for the Democratic party, believing in the right of the people to, and in the capacity of the people for, self-government, has insisted upon giving them as large a part as possible in the control of their own affairs.

It follows, therefore, that the Democratic party favors local self-government and opposes the centralization of power in remote centres. It believes that the nearer the people are to their government the more effective will be their control over it. The various parties that have opposed the Democratic party have given more or less emphasis to the Hamiltonian view and have increased the power of the representative at the expense of the constituents.

While this distinction has not at all times been clearly marked, and while these views have not been held by all the individual members, the general tendency has existed.

In the very beginning this tendency was illustrated in the Alien and Sedition laws, enacted by the Federalists and in the Kentucky and Virginia resolutions supported by the Democrats. (See ALIEN AND SEDITION ACTS, also Kentucky resolutions and Virginia resolutions.) Both parties in this instance went to the extreme, the Federalists attempting to confer dangerous power upon the Federal government, the Democrats asserting views which were afterward so misconstrued as to weaken the Federal Union. The preservation of the balance between the Federal government and the State governments has always been a delicate matter, and as the line cannot be drawn with mathematical accuracy there has always been room for dispute; the public sentiment having gone to the one side or the other as it was necessary to maintain the equilibrium. It is likely that this discussion will continue, but the efforts to carry the government to an extreme in either direction will be thwarted by the conservative middle class, which rallies to the support of the side that is attacked.

Beginning with Jefferson's administration in 1801, and continuing to the end of Monroe's administration in 1825, the Democratic party held undisputed sway in the nation. Jefferson, like Washington, refused to consider a third term, and his secretary of state, James Madison (q.v.), succeeded him. Madison, following the example set by his predecessor, retired at the end of his second term, and James Monroe (q.v.), who had been his secretary of state, succeeded him.

The War of 1812 was conducted by the Madison administration, and it was during this period that the Hartford resolutions were adopted by a convention of Federalists which met at Hartford, Conn., in December 1814. These resolutions went further in the direction of States rights than either the Kentucky resolutions or the Virginia resolutions. They began by recommending "to the legislatures of the several States represented in this convention, to adopt all such measures as may be necessary effectually to protect the citizens of said States from the operation and effects of all acts which have been or may be passed by the Congress of the United States, which shall contain provisions subjecting the militia or other citizens to forcible drafts, conscriptions, or impressments not authorized by the Constitution of the United States."

While the Hartford resolutions announced a political policy, they had their origin in the commercial interests which were affected by the War of 1812, and by the embargo act (see EMBARGO) which was enacted as a war measure.

The Federal party which supported Clinton's candidacy in 1812 laid great stress upon the commercial interests. The platform adopted by the New York Federalists urged the election of Clinton as the surest method of guaranteeing the protection of those commercial interests which were flagging "under the weakness and imbecility of the administration." The Federalists attacked what they called the Virginia regency, and the Hartford resolutions recommended a constitutional amendment making the President ineligible for renomination, and another prohibiting the selection of two Presidents in succession from the same State.

It was during the administration of James Monroe that the doctrine, afterward known by his name, and followed ever since, was promulgated. The doctrine was set forth in a message sent to Congress by James Monroe on 2 Dec. 1823. (See MONROE DOCTRINE.) The following is the text covering this subject:

> In the wars of European powers, in matters relating to themselves, we have never taken any part, nor does it comport with our policy so to do. It is only when our rights are invaded or seriously menaced that we resent injuries or make preparations for our defense. With the movements on this hemisphere we are, of necessity, more immediately connected, and by causes which must be obvious to all enlightened and impartial observers. The political system of the allied powers (the Holy Alliance) is essentially different in this respect from that of America. This difference proceeds from that which exists in their respective governments. And to the defense of our own, which has been achieved by the loss of so much blood and treasure, and matured by the wisdom of their most enlightened citizens and under which we have enjoyed unexampled felicity, this whole nation is devoted. We owe it, therefore, to candor and to the amicable relations existing between the United States and those powers to declare that we should consider any attempt on their part to extend their system to any portion of this hemisphere as dangerous to our peace and safety. With the existing colonies or dependencies of any European power we have not interfered, and shall not interfere. But with the governments who have declared their independence and maintained it we have on great consideration and on just principles, acknowledged we could not view any interposition for the purpose of oppressing them, or controlling in any other manner their destiny, by any European power, in any other light than as the manifestation of an unfriendly disposition toward the United States. Our policy in regard to Europe, which was adopted at an early stage of the wars which have so long agitated that quarter of the globe, nevertheless remains the same, which is not to interfere in the internal concerns of any of its powers; to consider the government de facto as the legitimate government for us; to cultivate friendly relations with it, and to preserve those relations by a frank, firm, and manly policy; meeting in all instances the just claims of every power, submitting to injuries from none. But in regard to those continents, circumstances are eminently and conspicuously different. It is impossible that the allied powers should extend their political system to any portion of either continent without endangering our peace and happiness; nor can any one believe that our southern brethren, if left to themselves, would adopt it of their own accord. It is equally impossible, therefore, that we should behold such interposition, in any form, with indifference.

This message was written after consultation with Jefferson, who was then living in retire-

ment at Monticello. The following extract from a letter written by Jefferson to Monroe in October 1823, not only shows Jefferson's part in the formulation of the doctrine, but also proves his foresight and his comprehension of American interests, and his devotion to the welfare of his country:

> The question presented by the letters you have sent me, is the most momentous which has been offered to my contemplation since that of Independence. That made us a nation, this sets our compass and points the course which we are to steer through the ocean of time opening on us. And never could we embark on it under circumstances more auspicious. Our first and fundamental maxim should be, never to entangle ourselves in the broils of Europe. Our second, never to suffer Europe to intermeddle with cis-Atlantic affairs. America, North and South, has a set of interests distinct from those of Europe and peculiarly her own. She should, therefore, have a system of her own, separate and apart from that of Europe. While the last is laboring to become the domicile of despotism, our endeavor should surely be to make our hemisphere that of freedom. One nation most of all, could disturb us in this pursuit; she now offers to lead, aid, and accompany us in it. By acceding to her proposition, we detach her from the bands, bring her mighty weight into the scale of free government, and emancipate a continent at one stroke, which might otherwise linger long in doubt and difficulty. Great Britain is the nation which can do us the most harm of any one, or all on earth; and with her on our side we need not fear the whole world. With her, then, we should most sedulously cherish a cordial friendship; and nothing would tend more to knit our affections than to be fighting once more side by side in the same cause. Not that I would purchase even her amity at the price of taking part in her wars. But the war in which the present proposition might engage us, should that be its consequence, is not her war, but ours. Its object is to introduce and establish the American system, of keeping out of our land all foreign powers, of never permitting those of Europe to intermeddle with the affairs of our nations. It is to maintain our own principle, not to depart from it. And if to facilitate this, we can effect a division in the body of the European powers, and draw over to our side its most powerful member, surely we should do it. But I am clearly of Mr. Canning's opinion, that it will prevent instead of provoke war. With Great Britain withdrawn from their scale and shifted into that of our two continents, all Europe combined would not undertake such a war. For how would they propose to get at either enemy without superior fleets? Nor is the occasion to be slighted which this proposition offers, of declaring our protest against the atrocious violations of the rights of nations by the interference of any one in the internal affairs of another, so flagitiously begun by Bonaparte, and now continued by the equally lawless Alliance calling itself Holy. But we have first to ask ourselves a question. Do we wish to acquire to our own confederacy any one or more of the Spanish provinces? I candidly confess that I have ever looked on Cuba as the most interesting addition which could ever be made to our system of States. The control which, with Florida Point, this island would give us over the Gulf of Mexico, and the countries and isthmus bordering on it, as well as all those whose waters flow into it, would fill up the measure of our political well-being. Yet, I am sensible that this can never be obtained, even with her own consent, but by war; and as its independence, which is our second interest (and especially its independence of England), can be secured without it, I have no hesitation in abandoning my first wish to future chances and accepting its independence, with peace and the friendship of England, rather than its association, at the expense of war and her enmity. I could honestly, therefore, join in the declaration proposed, that we aim not at the acquisition of any of those possessions, that we will not stand in the way of any amicable arrangement between them and the mother country; but that we will oppose, with all our means, the forcible interposition of any other power, as auxiliary, stipendiary, or under any other form or pretext, and most especially, their transfer to any power by conquest, cession, or acquisition in any other way.

Jefferson died on 4 July 1824, just 50 years after the signing of the Declaration of Independence. The year that marked his demise marked the entrance of the second great Democratic leader into the arena of politics.

Andrew Jackson (q.v.) of Tennessee, the hero of the War of 1812, had grown in fame and popularity from the day of his victory over the English at New Orleans. In 1824 he became the nominee of his party, and in the election following received 155,872 votes, as against 105,321 cast for John Quincy Adams; 44,282 cast for Crawford; and 46,587 cast for Henry Clay. In the Electoral College, Jackson received 99 votes, Adams 84, Crawford 41, and Clay 37. As no one of the candidates had a majority in the Electoral College the election of the President devolved upon the House of Representatives; and by a coalition between the friends of Adams and the friends of Clay, the former received the votes of 13 States, while Jackson received but 7 and Crawford 4.

The defeat of Jackson after he had secured a large plurality of the popular vote, and a considerable plurality in the Electoral College, aroused great partisan feeling, and from that time until 1828, Jackson was the candidate of the party, his campaign growing in strength as the years proceeded until when election day arrived he had a popular majority of nearly 140,000, and a majority of nearly 100 in the Electoral College. Calhoun was chosen Vice-President at the same time.

The chief features of Jackson's administration were his treatment of the nullification act of the South Carolina legislature, and his veto of the act for the rechartering of the United States bank. He took vigorous steps to enforce the Federal authority and, in an elaborate message, presented the arguments against the right of secession with a force and clearness never since surpassed. His action in this matter resulted in the alienation of John C. Calhoun, who up to that time had been a staunch political friend.

The fight over the bank charter not only occupied a large part of the time of his administration, but resulted in a controversy that permeated other issues. The Senate passed a resolution censuring him for removing the deposits from the bank, and this became an issue. Under the leadership of Thomas H. Benton, of Missouri, the Democrats began a fight for the reversal of the action of the Senate, and finally secured a majority of that body and expunged the resolution.

While Jackson's military achievements were the foundation for his early popularity, his great political fame was due to championing the cause of the masses, as against the concentrated power of wealth. In his message vetoing the bank charter he presented with emphasis and accuracy the Democratic view of the sphere of government. He said:

> Distinctions in society will always exist under every just government. Equality of talents, of education, or of wealth, cannot be produced by human institutions. In the full enjoyment of the gifts of heaven and the fruits of superior industry, economy, and virtue every man is equally entitled to protection by law. But when the laws undertake to add to those natural and just advantages artificial distinctions — to grant titles, gratuities, and exclusive privileges — to make the rich richer and the potent more powerful — the humble members of society — the farmers, mechanics, and the laborers — who have neither the time nor the means of securing like favors for themselves,

have a right to complain of the injustice of their government.

Jackson's position on the bank charter represented the views of his party adherents. His veto was sent to Congress on 10 July 1831, and it was the main issue of the campaign of 1832, when with Henry Clay as his opponent he secured a popular plurality of 157,000. In the Electoral College he had 219 votes as against 49 cast for Clay. His secretary of state, Martin Van Buren, succeeded him as the Democratic candidate, and was elected, having both a popular majority and a majority in the Electoral College. Van Buren defeated William Henry Harrison in that year, and was defeated by him in the following campaign. In the earlier campaigns the nominations were made by a Congressional caucus, or by the various States, but Jackson's renomination in 1832 was made by a national convention held at Baltimore, and Van Buren was nominated by a convention held at the same place four years later.

In 1840 the Democratic convention was again held at Baltimore, Van Buren was renominated and a lengthy platform was adopted. As this platform was the basis of all platforms adopted from that time to the breaking out of the Civil War it is worthy of reproduction. It was as follows:

1. Resolved, That the Federal government is one of limited powers, derived solely from the Constitution, and the grants of powers shown therein ought to be strictly construed by all the departments and agents of the government, and that it is inexpedient and dangerous to exercise doubtful constitutional powers.

2. Resolved, That the Constitution does not confer upon the general government the power to commence and carry on a general system of internal improvements.

3. Resolved, That the Constitution does not confer authority upon the Federal government directly or indirectly, to assume the debts of the several States, contracted for local internal improvements or other State purposes; nor would such assumption be just or expedient.

4. Resolved, That justice and sound policy forbid the Federal government to foster one branch of industry to the detriment of another, or to cherish the interests of one portion to the injury of another portion of our common country — that every citizen and every section of the country has a right to demand and insist upon an equality of rights and privileges, and to complete and ample protection of persons and property from domestic violence or foreign aggression.

5. Resolved, That it is the duty of every branch of the government to enforce and practice the most rigid economy in conducting our public affairs, and that no more revenue ought to be raised than is required to defray the necessary expenses of the government.

6. Resolved, That Congress has no power to charter a United States bank; that we believe such an institution one of deadly hostility to the best interests of the country, dangerous to our Republican institutions, and the liberties of the people, and calculated to place the business of the country within the control of a concentrated money power and above the laws and the will of the people.

7. Resolved, That Congress has no power under the Constitution to interfere with or control the domestic institutions of the several States; and that such States are the sole and proper judges of everything pertaining to their own affairs, not prohibited by the Constitution; that all efforts by Abolitionists or others, made to induce Congress to interfere with questions of slavery or to take incipient steps in relation thereto, are calculated to lead to the most alarming and dangerous consequences, and that all such efforts have an inevitable tendency to diminish the happiness of the people, and endanger the stability and permanence of the Union, and ought not to be countenanced by any friend to our political institutions.

8. Resolved, That the separation of the moneys of the government from banking institutions is indispensable for the safety of the funds of the government and the rights of the people.

9. Resolved, That the liberal principles embodied by Jefferson in the Declaration of Independence, and sanctioned in the Constitution, which make ours the land of liberty and the asylum of the oppressed of every nation, have ever been cardinal principles in the Democratic faith; and every attempt to abridge the present privilege of becoming citizens, and the owners of soil among us ought to be resisted with the same spirit which swept the Alien and Sedition laws from our statute book.

As the names of several different persons had been presented for Vice-President the convention of 1840 made no nominations for that office, but adopted resolutions leaving the decision to members of the party in the various States, and trusting that "before the election took place the opinion would be so concentrated as to enable the Electoral College to secure the choice of a Vice-President."

Upon the death of Harrison, John Tyler became President, and during his term vetoed two bills, which had for their object the re-establishing of the United States bank. Tyler favored the annexation of Texas, which had separated from Mexico and had existed under an independent government since 1836. Jas. K. Polk, the Democratic candidate, also favored annexation, while Henry Clay, for a third time a candidate for the Presidency, opposed annexation.

In the platform of 1844, the first nine resolutions of the platform of 1840 were reaffirmed, and new resolutions added demanding, first, that the proceeds of public lands be sacredly applied to the national object specified in the Constitution, rather than distributed among the States; second, sustaining and defending the veto of the President which had "thrice saved the Americans from the corrupt and tyrannical domination of the Bank of the United States," and third, declaring for the annexation of Texas. The campaign resulted in the election of Polk and Dallas, although their majority in the Electoral College was proportionately larger than their popular plurality.

The campaign of 1848 was waged with Lewis Cass of Michigan and William O. Butler of Kentucky as the Democratic candidates for President and Vice-President. The platform of 1848 reaffirmed that of 1840 and 1844, and added new planks covering new questions. Resolution No. 19 of the platform of 1848 is given below because it reiterates the Democratic contention in regard to the value of self-government. It reads:

Resolved, That in view of the recent development of this grand political truth, of the sovereignty of the people and their capacity and power for self-government, which is prostrating thrones and erecting republics on the ruins of despotism in the Old World, we feel that a high and sacred duty is devolved, with increased responsibility, upon the Democratic party of this country, as the party of the people, to sustain and advance among us constitutional liberty, equality, and fraternity, by continuing to resist all monopolies and exclusive legislation for the benefit of the few at the expense of the many, and by a vigilant and constant adherence to those principles and compromises of the Constitution, which are broad enough and strong enough to embrace and uphold the Union as it was, the Union as it is, and the Union as it shall be, in the full expansion of the energies and capacity of this great and progressive people.

The Whig candidates, however, Zachary Taylor and Millard Fillmore, were successful that year, having both a popular majority and a majority in the Electoral College. In the campaign of 1852, Franklin Pierce of New Hampshire and William R. King of Alabama were the Democratic nominees, and the platform reiterated the leading planks of 1840, 1844 and 1848.

The platform of 1852 also reiterated the principles laid down in the Kentucky and Virginia resolutions, and defended the Mexican war "as just and necessary." The campaign of 1852 resulted in an overwhelming Democratic victory, the popular plurality being more than 200,000.

The slavery question was constantly growing in prominence, and at last exerted an influence upon every issue that arose. The position taken by the various parties in regard to the Mexican war was largely determined by the slavery views held by the members of the parties.

The Fugitive Slave laws of the various States also came up for consideration, and each election showed an increase in the anti-slavery sentiment. In 1856 the Democratic platform again reaffirmed the principles set forth in 1840, and reiterated in subsequent campaigns. It quoted resolution 7 of the platform of 1840, and said:

> That the foregoing proposition covers, and was intended to embrace, the whole subject of slavery agitation in Congress; and, therefore, the Democratic party of the Union, standing on this national platform, will abide by, and adhere to, a faithful execution of the acts known as the compromise measures settled by the Congress of 1850, "the act for reclaiming fugitives from service labor" included; which act, being designed to carry out an express provision of the Constitution, cannot, with fidelity thereto, be repealed, or so changed as to destroy or impair its efficiency; that the Democratic party will resist all attempts at renewing in Congress, or out of it, the agitation of the slavery question, under whatever shape or color the attempt may be made.

The Republican party took the name by which the Democratic party was originally known, and it held its first national convention in 1856, John C. Fremont and William L. Dayton being the nominees. James Buchanan and John C. Breckinridge were the Democratic nominees. They received a majority of 60 in the Electoral College and a popular plurality of about 500,000. The American party, led by Millard Fillmore and Andrew J. Donelson, secured only 8 electors but polled 874,000 votes. During the Buchanan administration the Dred Scott decision was rendered, and this, while it was a legal victory for the friends of slavery, resulted in an anti-slavery agitation that inured to the advantage of the Republican party.

In 1860 the conflict between the northern and southern Democrats became irreconcilable, and the Charlestown convention, which met 23 April, having failed to harmonize the differences, adjourned without a nomination. The northern Democrats met at Baltimore 18 June and nominated Stephen A. Douglas of Illinois for President and Herschel V. Johnson of Georgia for Vice President, while the southern wing of the party met at the same place 10 days later, and nominated John C. Breckinridge of Kentucky for President and Joseph Lane of Oregon for Vice-President. As the Douglas platforms adopted at that time represented the positions taken by the two wings of the party they will be found below:

1. Resolved, That we, the Democracy of the Union, in convention assembled, hereby declare our affirmance of the resolutions unanimously adopted and declared as a platform of principles by the Democratic convention at Cincinnati, in the year 1856, believing that Democratic principles are unchangeable in their nature when applied to the same subject matters; and we recommend, as the only further resolutions, the following:

Inasmuch as differences of opinion exist in the Democratic party as to the nature and extent of the powers of a Territorial legislature, and as to the powers and duties of Congress, under the Constitution of the United States, over the institution of slavery within the Territories.

2. Resolved, That the Democratic party will abide by the decisions of the Supreme Court of the United States on the question of constitutional law.

3. Resolved, That it is the duty of the United States to afford ample and complete protection to all its citizens, whether at home or abroad, and whether native or foreign.

4. Resolved, That one of the necessities of the age, in a military, commercial, and postal point of view, is speedy communication between the Atlantic and Pacific States; and the Democratic party pledge such constitutional government aid as will insure the construction of a railroad to the Pacific coast at the earliest practicable period.

5. Resolved, That the Democratic party are in favor of the acquisition of the island of Cuba, on such terms as shall be honorable to ourselves and just to Spain.

6. Resolved, That the enactments of State legislatures to defeat the faithful execution of the Fugitive Slave Law are hostile in character, subversive of the Constitution, and revolutionary in their effect.

7. Resolved, That it is in accordance with the true interpretation of the Cincinnati platform, that, during the existence of the Territorial governments, the measure of restriction, whatever it may be, imposed by the Federal Constitution on the power of the Territorial legislature over the subject of domestic relations, as the same has been or shall hereafter be finally determined by the Supreme Court of the United States, shall be respected by all good citizens, and enforced with promptness and fidelity by every branch of the general government.

The "Breckinridge platform" was as follows:

Resolved, That the platform adopted by the Democratic party at Cincinnati be affirmed, with the following explanatory resolutions:

1. That the government of a Territory, organized by an act of Congress is provisional and temporary; and, during its existence, all citizens of the United States have an equal right to settle, with their property in the Territory, without their rights, either of person or property, being destroyed or impaired by congressional or territorial legislation.

2. That it is the duty of the Federal government, in all its departments, to protect when necessary, the rights of persons and property in the Territories, and wherever else its constitutional authority extends.

3. That when the settlers in a Territory having an adequate population, form a State Constitution in pursuance of law, the right of sovereignty commences, and, being consummated by admission into the Union, they stand on an equal footing with the people of the other States, and the State thus organized ought to be admitted into the Federal Union, whether its Constitution prohibits or recognizes the institution of slavery.

4. That the Democratic party are in favor of the acquisition of the island of Cuba, on such terms as shall be honorable to ourselves, and just to Spain, at the earliest practicable moment.

5. That the enactments of State legislatures to defeat the faithful execution of the Fugitive Slave law are hostile in character, subversive of the Constitution and revolutionary in their effect.

6. That the Democracy of the United States recognize it as the imperative duty of this government to protect the naturalized citizens in all their rights, whether at home or in foreign lands, to the same extent as its native-born citizens.

Whereas, One of the greatest necessities of the age, in a political, commercial, postal, and military point of view, is a speedy communication between the Pacific and Atlantic coasts; therefore be it

Resolved, That the Democratic party do hereby pledge themselves to use every means in their power to secure the passage of some bill to the extent of the constitutional authority of Congress, for the construction of a Pacific railroad, from the Mississippi River to the Pacific Ocean, at the earliest practicable moment.

It will be seen that both conventions reaffirmed the Cincinnati platform of 1856. It will also be noticed that the only difference between the platforms grew out of the slavery question, the Douglas platform leaving the question to the Supreme Court, promising to abide by its decision; the Breckinridge platform declaring that the people of a territory had the right to decide the slavery question for themselves, and also declaring that the citizens of the various States had the right to settle in a territory and carry their property with them (meaning slaves) without being interfered with by congressional action.

The election of 1860 resulted in a victory for the Republican party, whose candidates, Abraham Lincoln and Hannibal Hamlin, ran upon a platform denouncing "threats of disunion," and saying that "the new dogma, that the Constitution, of its own force, carries slavery into any or all of the Territories of the United States," was a "dangerous political heresy." The platform did not call for the abolition of slavery in the States where it existed, but asserted "that the normal condition of all the territory of the United States is that of freedom; that as our Republican fathers, when they had abolished slavery in all our national territory, ordained that 'no person shall be deprived of life, liberty or property, without due process of law,' it becomes our duty by legislation, whenever such legislation is necessary, to maintain this provision of the Constitution against all attempts to violate it; and we deny the authority of Congress, of a territorial legislature, or any individuals, to give legal existence to slavery in any Territory of the United States."

Lincoln received a popular plurality of nearly 500,000, and a plurality of 108 in the Electoral College. Douglas came second in the popular vote, but fell behind both the Breckinridge ticket and Bell and Everett ticket in the Electoral College. This was due to the fact that the Douglas vote was large in the States which Lincoln carried.

In the war between the States the supporters of Douglas enlisted side by side with the supporters of Lincoln, Douglas himself having urged the support of Lincoln in the war for the maintenance of the Union. During the War, however, many things were done which aroused criticism from the Democratic leaders, and by the Democrats generally. Among the things complained of were arrests and courts-martial in States not in insurrection, and where the civil authority was undisturbed.

The Democratic platform of 1864 announced "unswerving fidelity to the Union under the Constitution, as the only solid foundation of our strength, security and happiness as a people, and as a framework of government equally conducive to the welfare and prosperity of all the States, both Northern and Southern"; and then declared

as the sense of the American people, that after four years of failure to restore the Union by the experiment of war, during which, under the pretense of a military necessity of a war power higher than the Constitution, the Constitution itself has been disregarded in every part and public liberty and private right alike trodden down, and the material prosperity of the country essentially impaired, justice, humanity, liberty, and the public welfare demand that immediate efforts be made for a cessation of hostilities, with a view to an ultimate convention of all the States, or other peaceable means, to the end that, at the earliest practicable moment, peace may be restored on the basis of the Federal union of all the States.

Gen. George B. McClellan of New Jersey was nominated by the Democratic party for President and George H. Pendleton of Ohio for Vice-President. The election resulted in a popular majority of 408,000 for the Republican ticket, and in an electoral majority of 191 — Kentucky, New Jersey and Delaware being the only three of the 24 States giving their electoral vote to the Democratic ticket. It will be seen that the Republican plurality was less than it was in 1860.

The assassination of Abraham Lincoln and the inauguration of Vice-President Andrew Johnson (q.v.) as President precipitated a struggle in which most of the Republican senators and members of Congress were arrayed against the President. The Democrats took the side of the President, and with the aid of a few Republicans prevented the adoption of the articles of impeachment presented by the House.

During the reconstruction period that followed, the Democrats insisted that the States which were held in the Union should be given the rights and privileges of other States.

The campaign of 1868 was fought under the leadership of Horatio Seymour of New York and Francis P. Blair of Missouri, and the platform demanded:

1. Immediate restoration of all the States to their rights in the Union under the Constitution, and of civil government to the American people.

2. Amnesty for all past political offenses, and the regulation of the elective franchise in the States by their citizens.

3. Payment of all the public debt of the United States as rapidly as practicable — all money drawn from the people by taxation, except so much as is requisite for the necessities of the government, economically administered, being honestly applied to such payment; and when the obligations of the government do not expressly state upon their face, or the law under which they were issued does not provide that they shall be paid in coin, they ought, in right and justice, to be paid in the lawful money of the United States.

4. Equal taxation of every species of property according to its real value, including government bonds and other public securities.

5. One currency for the government and the people, the laborer and the office-holder, the pensioner, and the soldier, the producer and the bondholder.

6. Economy in the administration of the government; the reduction of the standing army and navy; the abolition of the Freedman's Bureau and all political instrumentalities designed to secure negro supremacy; simplification of the system and discontinuance of inquisitorial modes of assessing and collecting internal revenue; that the burden of taxation may be equalized and lessened, and the credit of the government and the currency made good; the repeal of all enactments for enrolling the State militia into national forces in times of peace; and a tariff for revenue upon foreign imports, and such equal taxation under the internal-revenue laws as will afford incidental protection to domestic manufactures, and as will, without impairing the revenue, impose the least burden upon, and best promote and encourage the great industrial interests of the country.

7. Reform of abuses in the administration; the expulsion of corrupt men from office; the abrogation of useless offices; and the restoration of rightful author-

ity to, and the independence of, the executive and judicial departments of the government; the subordination of the military to the civil power, to the end that the usurpations of Congress and the despotism of the sword may cease.

8. Equal rights and protection for naturalized and native-born citizens, at home and abroad; the assertion of American nationality which shall command the respect of foreign powers, and furnish an example and encouragement to people struggling for national integrity, constitutional liberty, and individual rights; and the maintenance of the rights of naturalized citizens against the absolute doctrine of immutable allegiance and the claims of foreign powers to punish them for alleged crimes committed beyond their jurisdiction.

Besides this statement of the position of the parties, the platform arraigned the Republican party for its reconstruction policy, charging that instead of restoring the Union it had "so far as was in its power dissolved it and subjected 10 States in time of profound peace to military despotism and negro supremacy," and that it had "nullified the right of trial by jury, abolished the right of *habeas corpus* and overthrown the freedom of speech and press." The Republicans nominated Gen. Grant and Schuyler Colfax, and secured a popular plurality of about 300,000 (less than the plurality of 1864), and an electoral majority of 134.

In May 1872, a convention known as the Liberal Republican Convention was held at Cincinnati, Ohio, and nominated Horace Greeley of New York for President and Benjamin Gratz Brown of Missouri for Vice-President. The platform demanded the recognition of the doctrines of equality of all men before the law, and pledged the party's support to Articles 13, 14 and 15 of our amended national Constitution. It favored the sacred maintenance of the public credit, opposed repudiation and insisted upon the return to specie payments.

The Democrats met on 9 July at Baltimore and nominated the same ticket and adopted a platform substantially like the one adopted by the Liberal Republicans.

Those members of the Democratic party describing themselves as "straight-out" Democrats met 3 September following, and nominated Charles O'Connor of New York for President and John Quincy Adams of Massachusetts for Vice-President; although both declined, nearly 30,000 votes were cast for the head of the ticket. The platform declared that the Baltimore convention had betrayed the party into a false creed and false leadership, and proclaimed that the members of the "straight-out" Democratic party preferred principle to power, and would not surrender those principles in exchange for offices which Presidents confer." The election resulted in an overwhelming victory for the Republican ticket, Grant and Wilson receiving 286 electoral votes out of 349, and a popular plurality of more than 750,000.

The nomination of Horace Greeley brought to his party a large number of influential Republicans and alienated many Democrats, yet the party's vote was only about 125,000 more than the Democratic vote of 1868; while the Republican vote of 1872 was nearly 600,000 greater than the vote of four years before.

The Democrats entered the campaign of 1876 with courage and confidence. The discovery of corruption in several of the departments, and the conviction of officials high in authority, together with the panic of 1873, had broken the prestige of the Republican party and caused a wide-spread demand for reform. The Democratic party took advantage of the situation, and nominated as its candidates Samuel J. Tilden of New York, who had become conspicuous in reform in his State, and Thomas A. Hendricks of Indiana, who represented all that was highest, purest and best in Democratic principle and purpose. The platform described the abuses of power and demanded reform in every department. Among other things it demanded reform in the tariff, and condemned the resumption clause of 1875.

The campaign resulted in a popular plurality of 250,000 for Tilden and Hendricks. The result, however, was disputed, and charges of fraud were made in the election of several States. The situation grew so serious that Congress created an Electoral Commission to which the whole matter was referred. This commission was composed of five senators selected by that body, five members of Congress selected by that body, and the five senior members of the Supreme Court. (See ELECTORAL COMMISSION.)

The Senate being Republican selected 3 Republicans and 2 Democrats; the House being Democratic selected 3 Democrats and 2 Republicans, and of the judges 3 were Republicans and 2 Democrats. The Electoral Commission thus contained 8 Republicans and 7 Democrats, and on every contested question the vote stood 8 to 7, each member casting his vote so that it would aid his party.

The Democrats of 1880 endorsed the principles embodied in the platform of 1876, protested against centralization as dangerous to the government, and denounced the "great fraud of 1876 and 1877 by which upon a false count of the electoral votes of two States the candidate defeated at the polls was declared to be President, and for the first time in American history the will of the people was set aside under a threat of military violence." The righting of the wrong of 1876 was declared to be the paramount issue. Gen. Winfield Scott Hancock, the Democratic nominee, weakened his campaign by putting the tariff question aside as "a local issue." He was defeated, however, by a popular vote of less than 10,000, and by only 59 votes in the Electoral College.

In 1884 the Democrats met at Chicago and nominated Grover Cleveland of New York for President and Thomas A. Hendricks of Indiana for Vice-President. A platform of great length was adopted; the tariff question being the one discussed at great length. The platform contained the following plank on the money question: "We believe in honest money, the gold and silver coinage of the Constitution, and a circulating medium convertible into such money without loss." This platform also contained a plank reaffirming that portion of the Democratic platform of 1856, which endorsed the liberal principles of Jefferson.

The Republican ticket, headed by James G. Blaine and John A. Logan, received a plurality of a little more than 20,000 in the popular vote, but Mr. Cleveland had 37 majority in the Electoral College.

The Democratic platform of 1888 reaffirmed the platform adopted in 1884, and endorsed the President's views on the tariff question as ex-

pressed in the tariff message which he sent to Congress in December 1887. The tariff question was made the paramount issue, and the campaign waged on this question, and resulted in the election of the Republican ticket, and its candidates, Benjamin Harrison and Levi P. Morton, that ticket having a majority of 65 in the Electoral College, although the Democratic ticket had a popular plurality of about 100,000.

During the Cleveland administration an attempt was made to reduce the tariff, and the Mills Bill received the support of the Democratic members of the Senate and House. The Republicans, however, took advantage of the Republican victory of 1888 to propose and enact a high tariff law, known as the McKinley Act, taking its name from the chairman of the Ways and Means Committee of the House. The passage of this law was followed by an increase in prices of commodities, and it became the paramount issue in the following campaign of 1892. The Democratic party that year nominated Grover Cleveland for a third time, and named Adlai E. Stevenson of Illinois as his running mate.

There was a fight in the convention over the tariff plank, and as finally adopted it declared that the Federal government had no constitutional power to impose and collect tariff duties except for revenue only. The trusts were denounced, and the party pledged to the enactment of laws made to prevent and control them.

The money plank of the platform was as follows:

> We denounce the Republican legislation known as the Sherman Act of 1890 as a cowardly makeshift, fraught with possibilities of danger in the future which should make all of its supporters, as well as its author, anxious for its speedy repeal. We hold to the use of both gold and silver as the standard money of the country, and to the coinage of both gold and silver without discrimination against either metal or charge for mintage, but the dollar unit of coinage of both metals must be of equal intrinsic and exchangeable value or be adjusted through international agreement, or by such safeguards of legislation as shall ensure the maintenance of the parity of the two metals, and the equal power of every dollar at all times in the markets and in the payments of debts; and we demand that all paper currency shall be kept at par with and redeemable in such coin. We insist upon this policy as especially necessary for the protection of the farmers and laboring classes, the first and most defenseless victims of unstable money and a fluctuating currency.

President Harrison was renominated by the Republicans and Whitelaw Reid was placed upon the ticket with him. In the election the Democratic ticket polled a plurality of 132 in the Electoral College and a popular plurality of about 380,000. The People's Party nominated James B. Weaver of Iowa for President and James G. Field of Virginia for Vice-President, and polled a little more than 1,000,000 votes.

During President Cleveland's second term, two questions occupied public attention, the money question and the tariff question. Congress was called together in extraordinary session in August 1893, and the President recommended the unconditional repeal of the Sherman law. By reference to the Democratic platform of 1892 it will be seen that the money plank contained a statement of the party's faith in the double standard, as well as its desire for the repeal of the Sherman Act, and an effort to repeal the makeshift without restoring the double standard caused a division in the ranks of the party, but the President succeeded in securing the legislation which he desired; doing this, however, he had the support of a larger percentage of the Republican senators and members than he had of the Democrats.

Congressman Wilson, chairman of the Ways and Means Committee, reported a measure which bears his name, and the bill as it passed the House was satisfactory to the friends of tariff reform, but it was emasculated by the Senate, where a coterie of Democratic senators refused to support it until the rates of several schedules were raised. The President refused to sign the bill, but allowed it to become a law without his signature. The bill contained an income tax, but this clause was declared unconstitutional by the Supreme Court, the vote standing 5 to 4. The decision was rendered at the second hearing; at the first hearing the vote stood 4 to 4, and as the 9th judge who was not present until the second hearing favored the tax, it required a change of opinion on the part of one of the judges to render the income tax inoperative.

After the passage of the tariff law the currency question again occupied the attention of Congress and became the paramount issue in the campaign of 1896. The money issue was fought out in the party and the delegates to the Chicago convention were instructed to carry out the financial policy endorsed by the members of the State convention selecting them, who in turn had been instructed by county conventions. As a result of this inter-party contest, the advocates of bimetallism won a decisive victory, having more than two thirds of the national delegates.

The following platform was adopted:

> We, the Democrats of the United States in National Convention assembled, do reaffirm our allegiance to those great essential principles of justice and liberty, upon which our institutions are founded, and which the Democratic party has advocated from Jefferson's time to our own — freedom of speech, freedom of press, freedom of conscience, the preservation of personal rights, the equality of all citizens before the law, and the faithful observance of constitutional limitations.
>
> During all these years the Democratic party has resisted the tendency of selfish interests to the centralization of governmental power, and steadfastly maintained the integrity of the dual scheme of government established by the founders of this Republic of republics. Under its guidings and teachings the great principle of local self-government has found its best expression in the maintenance of the rights of the States and in its assertion of the necessity of confining the general government to the exercise of the powers granted by the Constitution of the United States.
>
> The Constitution of the United States guarantees to every citizen the rights of civil and religious liberty. The Democratic party has always been the exponent of political liberty and religious freedom, and it renews its obligations and reaffirms its devotions to these fundamental principles of the Constitution.
>
> Recognizing that the money question is paramount to all others at this time, we invite attention to the fact that the Federal Constitution named silver and gold together as the money metals of the United States, and that the first coinage law passed by Congress under the Constitution made the silver dollar the monetary unit and admitted gold to free coinage at a ratio based upon the silver-dollar unit.
>
> We declare that the act of 1873 demonetizing silver without the knowledge or approval of the American people has resulted in the appreciation of gold and a corresponding fall in the prices of commodities produced by the people; a heavy increase in the burden of taxation and of all debts, public and private; the

enrichment of the money-lending class at home and abroad; the prostration of industry and impoverishment of the people.

We are unalterably opposed to monometallism, which has locked fast the prosperity of an industrial people in the paralysis of hard times. Gold monometallism is a British policy, and its adoption has brought other nations into financial servitude to London. It is not only un-American, but anti-American, and it can be fastened on the United States only by the stifling of that spirit and love of liberty which proclaimed our political independence in 1776 and won it in the War of the Revolution.

We demand the free and unlimited coinage of both silver and gold at the present legal ratio of 16 to 1 without waiting for the aid or consent of any other nation. We demand that the standard silver dollar shall be a full legal tender, equally with gold, for all debts, public and private, and we favor such legislation as will prevent for the future the demonetization of any kind of legal-tender money by private contract.

We are opposed to the policy and practice of surrendering to the holders of the obligations of the United States the option reserved by law to the government of redeeming such obligations in either silver coin or gold coin.

We are opposed to the issuing of interest-bearing bonds of the United States in time of peace and condemn the trafficking with banking syndicates, which, in exchange for bonds and at an enormous profit to themselves, supply the Federal treasury with gold to maintain the policy of gold monometallism.

Congress alone has the power to coin and issue money, and President Jackson declared that this power could not be delegated to corporations or individuals. We, therefore, denounce the issuance of notes intended to circulate as money by national banks as in derogation of the Constitution, and we demand that all paper which is made a legal tender for public and private debts, or which is receivable for dues to the United States, shall be issued by the government of the United States and shall be redeemable in coin.

We hold that tariff duties shall be levied for purposes of revenue, such duties to be so adjusted as to operate equally throughout the country, and not discriminate between class or section, and that taxation should be limited by the needs of the government, honestly and economically administered. We denounce as disturbing to business the Republican threat to restore the McKinley law, which has twice been condemned by the people in national elections, and which, enacted under the false plea of protection to home industry, proved a prolific breeder of trusts and monopolies, enriched the few at the expense of the many, restricted trade and deprived the producers of the great American staples of access to their natural markets.

Until the money question is settled we are opposed to any agitation for further changes in our tariff laws, except such as are necessary to meet the deficit in revenue caused by the adverse decision of the Supreme Court on the income tax. But for this decision by the Supreme Court there would be no deficit in the revenue under the law passed by a Democratic Congress in strict pursuance of the uniform decisions of that court for nearly 100 years, that court having in that decision sustained constitutional objections to its enactment which had previously been overruled by the ablest judges who have ever sat on that bench. We declare that it is the duty of Congress to use all the constitutional power which remains after that decision, or which may come from its reversal by the court as it may hereafter be constituted, so that the burdens of taxation may be equally and impartially laid, to the end that wealth may bear its due proportion of the expense of the government.

We hold that the most efficient way of protecting American labor is to prevent the importation of foreign pauper labor to compete with it in the home market, and that the value of the home market to our American farmers and artisans is greatly reduced by a vicious monetary system which depresses the prices of their products below the cost of production, and thus deprives them of the means of purchasing the products of our home manufactories; and as labor creates the wealth of the country, we demand the passage of such laws as may be necessary to protect it in all its rights.

We are in favor of the arbitration of differences between employers engaged in interstate commerce and their employees, and recommend such legislation as is necessary to carry out this principle.

The absorption of wealth by the few, the consolidation of our leading railroad systems, and the formation of trusts and pools require a stricter control by the Federal government of those arteries of commerce. We demand the enlargement of the power of the Inter-State Commerce Commission and such restriction and guarantees in the control of railroads as will protect the people from robbery and oppression.

We denounce the profligate waste of the money wrung from the people by oppressive taxation and the lavish appropriations of recent Republican congresses, which have kept taxes high, while the labor that pays them is unemployed and the products of the people's toil are depressed in price till they no longer repay the cost of production. We demand a return to that simplicity and economy which befits a Democratic government and a reduction in the number of useless offices the salaries of which drain the substance of the people.

We denounce arbitrary interference by Federal authorities in local affairs as a violation of the Constitution of the United States and a crime against free institutions, and we especially object to government by injunction as a new and highly dangerous form of oppression by which the Federal judges, in contempt of the laws of the States and rights of citizens, become at once legislators, judges, executioners; and we approve the bill passed at the last session of the United States Senate, and now pending in the House of Representatives, relative to contempts in Federal courts and providing for trials by jury in certain cases of contempt.

No discrimination should be indulged in by the government of the United States in favor of any of its debtors. We approve of the refusal of the Fifty-third Congress to pass the Pacific Railroad Funding Bill and denounce the effort of the present Republican Congress to enact a similar measure.

Recognizing the just claims of deserving Union soldiers, we heartily endorse the rule of the present commissioner of pensions, that no names shall be arbitrarily dropped from the pension roll; and the fact of enlistment and service should be deemed conclusive evidence against disease and disability before enlistment.

We favor the admission of the Territories of New Mexico, Arizona, and Oklahoma into the Union as States, and we favor the early admission of all the Territories having the necessary population and resources to entitle them to Statehood, and, while they remain Territories, we hold that the officials appointed to administer the government of any Territory, together with the District of Columbia and Alaska, should be *bona fide* residents of the Territory or District in which their duties are to be performed. The Democratic party believes in home rule and that all public lands of the United States should be appropriated to the establishment of free homes for American citizens.

We recommend that the Territory of Alaska be granted a delegate in Congress and that the general land and timber laws of the United States be extended to said Territory.

The Monroe Doctrine, as originally declared, and as interpreted by succeeding Presidents, is a permanent part of the foreign policy of the United States and must at all times be maintained.

We extend our sympathy to the people of Cuba in their heroic struggle for liberty and independence.

We are opposed to life tenure in the public service, except as provided in the Constitution. We favor appointments based on merit, fixed terms of office, and such an administration of the civil-service laws as will afford equal opportunities to all citizens of ascertained fitness.

We declare it to be the unwritten law of this Republic, established by custom and usage of one hundred years and sanctioned by the examples of the greatest and wisest of those who founded and have maintained our government, that no man should be eligible for a third term of the Presidential office.

The Federal government should care for and improve the Mississippi River and other great waterways of the Republic, so as to secure for the interior States easy and cheap transportation to tide water. When any waterway of the Republic is of sufficient importance to demand aid of the government, such aid should be extended upon a definite plan of continuous work until permanent improvement is secured.

Confiding in the justice of our cause and the necessity of its success at the polls, we submit the foregoing declaration of principles and purposes to the considerate judgment of the American people. We invite the support of all citizens who approve them and who desire to have them made effective through legislation,

for the relief of the people and the restoration of the country's prosperity.

The minority, led by Senator Hill of New York, submitted the following, which was rejected by the convention.

To the Democratic National Convention: 16 delegates, constituting the minority of the Committee on Resolutions, find many declarations in the report of the majority to which they cannot give their assent. Some of these are wholly unnecessary. Some are ill considered and ambiguously phrased, while others are extreme and revolutionary of the well-recognized principles of the party. The minority content themselves with this general expression of their dissent, without going into a specific statement of the objectionable features of the report of the majority; but upon the financial question, which engages at this time the chief share of public attention, the views of the majority differ so fundamentally from what the minority regard as vital Democratic doctrine as to demand a distinct statement of what they hold to as the only just and true expression of Democratic faith upon the paramount issue, as follows, which is offered as a substitute for the financial plank in the majority report:

"We declare our belief that the experiment on the part of the United States alone of free silver coinage and a change of the existing standard of value independently of the action of other great nations, would not only imperil our finances, but would retard or entirely prevent the establishment of international bimetallism, to which the efforts of the government should be steadily directed. It would place this country at once upon a silver basis, impair contracts, disturb business, diminish the purchasing power of the wages of labor, and inflict irreparable evils upon our nation's commerce and industry.

"Until international co-operation among leading nations for the coinage of silver can be secured we favor the rigid maintenance of the existing gold standard as essential to the preservation of our national credit, the redemption of our public pledges, and the keeping inviolate of our country's honor. We insist that all our paper and silver currency shall be kept absolutely at a parity with gold. The Democratic party is the party of hard money and is opposed to legal tender paper money as a part of our permanent financial system, and we therefore favor the gradual retirement and cancellation of all United States notes and Treasury notes, under such legislative provisions as will prevent undue contraction. We demand that the national credit shall be resolutely maintained at all times and under all circumstances."

The minority also feel that the report of the majority is defective in failing to make any recognition of the honesty, economy, courage and fidelity of the present Democratic administration. And they therefore offer the following declaration as an amendment to the majority report: "We commend the honesty, economy, courage and fidelity of the present Democratic National Administration."

The main resolutions submitted by the minority were rejected by more than a two thirds vote, and the platform as reported by the committee was adopted by the same vote. The resolution endorsing the administration was defeated by a little less than two thirds.

The convention named as its candidates William Jennings Bryan of Nebraska, and Arthur Sewall of Maine. The "National" Democrats met at Indianapolis in September following, issued a platform endorsing the gold standard and named John M. Palmer and Simon B. Buckner as their national ticket. William McKinley of Ohio, and Garrett A. Hobart of New Jersey were the nominees of the Republican convention. The platform contained a plank favoring a protective tariff, and a plank opposing free coinage until foreign co-operation could be secured, but pledging the party to promote international bimetallism.

The People's party, generally known as the Populist party, met at St. Louis and adopted a platform containing the same silver plank as the Democratic platform and endorsed and nominated the Democratic candidate for President. Instead of endorsing Mr. Sewall for the Vice-Presidency, the convention named Thomas E. Watson of Georgia for that office. The Silver Republicans met at the same time, endorsed the Democratic ticket and adopted a silver plank identical with the Democratic plank.

The campaign aroused deep feeling on both sides, and was warmly contested in the Central States. It became apparent early in the campaign that the Democratic ticket would carry the Western and Southern States, and that the Republican ticket would sweep the Eastern States. A very large vote was polled, the total that year being nearly 2,000,000 in excess of the total vote of four years before. The Republican party secured a popular plurality of 601,854. The electoral vote stood, McKinley and Hobart 271; Bryan and Sewall, 176.

Between 1896 and 1900 there was an improvement in industrial conditions, an increase in the volume of money, and a series of wars throughout the world. In 1898 the United States interfered in behalf of the Cubans and became involved in a war with Spain, which war resulted in Cuban independence, but during the war a naval victory in the Philippines put this nation in temporary control of those islands and resulted in our possession of them as an indemnity for the expenses incurred in behalf of the Cubans. The cession of the Philippine Islands to the United States raised a question which has not yet been settled. The sentiment is at present divided, the Democrats favoring the immediate promise that independence will be given as soon as a stable government is established, this independence to be accompanied by protection from outside interference. Some of the Republicans desire that the Philippine Islands be held under a colonial system, and others desire that the islands be given a territorial form of government with a view to ultimate statehood.

The Democratic convention which met at Kansas City, 4 July 1900, endorsed the Declaration of Independence, and adopted the following platform:

"We, the representatives of the Democratic party of the United States, assembled in national convention on the anniversary of the adoption of the Declaration of Independence, do reaffirm our faith in that immortal proclamation of the inalienable rights of man and our allegiance to the Constitution framed in harmony therewith by the fathers of the Republic. We hold with the United States Supreme Court that the Declaration of Independence is the spirit of our government, of which the Constitution is the form and letter.

We declare again that all governments instituted among men derive their just powers from the consent of the governed; that any government not based upon the consent of the governed is tyranny, and that to impose upon any people a government of force is to substitute the methods of imperialism for those of a republic. We hold that the Constitution follows the flag, and denounce the doctrine that an Executive or Congress, deriving their existence and their powers from the Constitution, can exercise lawful authority beyond it or in violation of it.

We assert that no nation can long endure half republic and half empire, and we warn the American people that imperialism abroad will lead quickly and inevitably to despotism at home.

Believing in these fundamental principles, we denounce the Porto Rican law, enacted by a Republican Congress against the protest and opposition of the Democratic minority, as a bold and open violation of the nation's organic law and a flagrant breach of the national good faith. It imposes upon the people of

Porto Rico a government without their consent and taxation without representation. It dishonors the American people by repudiating a solemn pledge made in their behalf by the commanding general of our army, which the Porto Ricans welcomed to a peaceful and unresisted occupation of their land. It doomed to poverty and distress a people whose helplessness appeals with peculiar force to our justice and magnanimity.

In this, the first act of its imperialistic programme, the Republican party seeks to commit the United States to a colonial policy inconsistent with republican institutions and condemned by the Supreme Court in numerous decisions.

We condemn and denounce the Philippine policy of the present administration. It has involved the public in unnecessary war, sacrificed the lives of many of our noblest sons and placed the United States, previously known and applauded throughout the world as the champion of freedom, in the false and un-American position of crushing with military force the efforts of our former allies to achieve liberty and self-government. The Filipinos cannot be citizens without endangering our civilization; they cannot be subjects without imperiling our form of government, and as we are not willing to surrender our civilization or to convert the republic into an empire, we favor an immediate declaration of the nation's purpose to give the Filipinos, first, a stable form of government; second, independence; and, third, protection from outside interference, such as has been given for nearly a century to the republics of Central and South America.

We are not opposed to territorial expansion when it takes in desirable territory which can be erected into States in the Union and whose people are willing and fit to become American citizens. We favor expansion by every peaceful and legitimate means. But we are unalterably opposed to seizing or purchasing distant islands to be governed outside the Constitution and whose people can never become citizens.

We are in favor of extending the Republic's influence among the nations, but believe that influence should be extended, not by force and violence, but through the persuasive power of a high and honorable example. The importance of other questions now pending before the American people is no wise diminished, and the Democratic party takes no backward step from its position on them, but the burning issue of imperialism growing out of the Spanish war involves the very existence of the republic and the destruction of our free institutions. We regard it as the paramount issue of the campaign.

The declaration in the Republican platform adopted at the Philadelphia convention, held in June 1900, that the Republican party "steadfastly adheres to the policy announced in the Monroe Doctrine," is manifestly deceptive. This profession is contradicted by the avowed policy of that party, in opposition to the spirit of the Monroe Doctrine, to acquire and hold sovereignty over large areas of territory and large numbers of people in the eastern hemisphere. We insist on the strict maintenance of the Monroe Doctrine in all its integrity, both in letter and in spirit, as necessary to prevent the extension of European authority on this continent and as essential to our supremacy in American affairs. At the same time we declare that no American people shall ever be held by force in unwilling subjection to European authority.

We oppose militarism. It means conquest abroad and intimidation and oppression at home. It means the strong arm which has ever been fatal to free institutions. It is what millions of our citizens have fled from in Europe. It will impose upon our peace-loving people a large standing army and unnecessary burden of taxation, and will be a constant menace to their liberties. A small standing army and a well disciplined State militia are amply sufficient in time of peace. This republic has no place for a vast military service and conscription.

In time of danger the volunteer soldier is his country's best defender. The National Guard of the United States should ever be cherished in the patriotic hearts of a free people. Such organizations are ever an element of strength and safety. For the first time in our history and coevil with the Philippine conquest has there been a wholesale departure from our time-honored and approved system of volunteer organization. We denounce it as un-American, un-Democratic and un-Republican and as a subversion of the ancient and fixed principles of a free people.

Private monopolies are indefensible and intolerable. They destroy competition, control the price of all material and of the finished product, thus robbing both producer and consumer. They lessen the employment of labor, and arbitrarily fix the terms and conditions thereof, and deprive individual energy and small capital of their opportunity for betterment. They are the most efficient means yet devised for appropriating the fruits of industry to the benefit of the few at the expense of the many, and unless their insatiate greed is checked all wealth will be aggregated in a few hands and the republic destroyed.

The dishonest paltering with the trust evil by the Republican party in State and national platforms is conclusive proof of the truth of the charge that trusts are the legitimate product of Republican policies, that they are fostered by Republican laws, and that they are protected by the Republican administration in return for campaign subscriptions and political support.

We pledge the Democratic party to an unceasing warfare in nation, State and city against private monopoly in every form. Existing laws against trusts must be enforced, and more stringent ones must be enacted providing for publicity as to the affairs of corporations engaged in interstate commerce, requiring all corporations to show, before doing business outside the State of their origin, that they have no water in their stock, and that they have not attempted, and are not attempting, to monopolize any branch of business or the production of any articles of merchandise, and the whole constitutional power of Congress over interstate commerce, the mails and all modes of interstate communication shall be exercised by the enactment of comprehensive laws upon the subject of trusts.

Tariff laws should be amended by putting the products of trusts upon the free list, to prevent monopoly under the plea of protection.

The failure of the present Republican administration, with an absolute control over all the branches of the national government, to enact any legislation designed to prevent or even curtail the absorbing power of trusts and illegal combinations, or to enforce the anti-trust laws already on the statute books, proves the insincerity of the high-sounding phrases of the Republican platform.

Corporations should be protected in all their rights, and their legitimate interests should be respected, but any attempt by corporations to interfere with public affairs of the people or to control the sovereignty which creates them should be forbidden under such penalties as will make such attempts impossible.

We condemn the Dingley tariff law as a trust-breeding measure, skilfully devised to give the few favors which they do not deserve and to place upon the many burdens which they should not bear.

We favor such an enlargement of the scope of the interstate commerce law as will enable the commission to protect individuals and communities from discriminations and the public from unjust and unfair transportation rates.

It will be seen that the question of imperialism was made the paramount issue, the trust question coming next in the amount of attention given to it. The convention, however, reaffirmed the principles embodied in the Chicago platform, and reiterated the position taken four years before on the money question and on several other questions.

Mr. Bryan was renominated and Adlai E. Stevenson of Illinois was placed upon the ticket as the candidate for Vice-President. This ticket was endorsed later by the People's Party convention, and by the Silver Republican convention, both of which parties adopted platforms in line with the Democratic platform upon the leading issues. The Democratic ticket was also endorsed by the Anti-imperialists.
